Fuel injection system parameters affecting combustion, noise and emissions in CI engines. Pilot, main, advanced post injection and retarded post injection. Electronically controlled Unit Injection system.Layout of the common rail fuel injection system.Working of components like fuel injector, fuel pump, rail pressure limiter, flow limiter, EGR valve.

UNIT – V: Digital Engine Control System:

Cold start and warm up phases, idle speed control, acceleration and full load enrichment, deceleration fuel cutoff. Fuel control maps, open loop control of fuel injection and closed loop lambda control – Integrated engine control system, Exhaust emission control engineering, Electromagnetic compatibility – EMI Suppression techniques – Electronic dash board instruments – Onboard diagnosis system.

AE 332 AUTOMOTIVE SAFETY (DEPT. ELECTIVE - II)

Course Description & Objectives:

To provide good exposure to automotive safety aspects including the understanding of the various safety equipments.

Course Outcomes:

On completion of the course, the students would be exposed to:

1. *various comfort features*
2. *recent technologies in automobile field*
3. *exterior and interior safety features and their necessity*

UNIT I: Introduction:

Design of the body for safety, energy equation, engine location, deceleration of vehicle inside passenger compartment, deceleration on impact with stationary and movable obstacle, concept of crumble zone, safety sandwich construction.

UNIT II: Safety Concepts:

Active safety: driving safety, conditional safety, perceptibility safety, operating safety, passive safety: exterior safety, interior safety, deformation behaviour of vehicle body, speed and acceleration characteristics of passenger compartment on impact.

UNIT III: Safety Equipments:

Seat belt, regulations, automatic seat belt tightener system, collapsible steering column, tiltable steering wheel, air bags, electronic system for activating air bags, bumper design for safety. **UNIT IV: Collision Warning and Avoidance:**

Collision warning system, causes of rear end collision, frontal object detection, rear vehicle object detection system, object detection system with braking system interactions.

UNIT V: Comfort and Convenience System:

Steering and mirror adjustment, central locking system , Garage door opening system, tyre pressure control system, rain sensor system, environment information system

TEXT BOOKS:

AE334 MINI PROJECT

Course Description & Objectives:

Objective of the mini project is to enable student analytical and practical exposure by giving hands on experience with learned knowledge through different courses. It prepares the student to efficiently handle the main project for better output.

Course Outcomes:

By undergoing this course, the student will try to integrate and apply the knowledge gained through different courses into practical problems and to analyse the system for its productivity and feasibility.

III Year II Semester

L	T	P	To	C
-	-	3	3	2

ME439 HEAT TRANSFER LAB

Course Description & Objectives:

Through this course, students will study about the various heat transfer processes, so as to train the students practically to utilize this knowledge in industry.

Course Outcomes:

On completion of the course, the students would be able to perform experiments on heat conduction, convection and radiation. They will be able to identify the heat exchange properties of various metals.

List of experiments

1. Composite Slab Apparatus - Overall heat transfer co-efficient.
2. Heat Transfer through lagged pipe.
3. Heat Transfer through a Concentric Sphere.
4. Thermal Conductivity of given metal rod.
5. Heat transfer through pin-fin
6. Experiment on Transient Heat Conduction.
7. Heat transfer in forced convection apparatus.
8. Heat transfer in natural convection.
9. Parallel and counter flow heat exchanger.
10. Emissivity apparatus.
11. Stefan Boltzman Apparatus.
12. Heat transfer in drop and film wise condensation.
13. Critical Heat flux apparatus.
14. Study of heat pipe and its demonstration.
15. Shell and tube heat exchanger.

III Year II Semester

HS304 PROFESSIONAL COMMUNICATION LABORATORY

Course Description & Objectives:

The course is aimed at improving written communication skills of undergraduate students and preparing them to meet professional challenges in the work spheres. This course will work on the relationship between professional writing and a personality that is able to meet the goals of an organization in creative and innovative ways.

Course Outcomes:

To enable students to write logical sentences and paragraphs, use appropriate diction, grammar and punctuation and to expose them to the world of business and business register. It also aims to make them compose clear and concise business messages and to produce business documents for mailing to external recipients or intra-organizational circulation. It aims to enable them to speak business English for handling various business situations.

UNIT – 1: Technical Writing:

Elements of Technical Writing : Sentence structure - reducing verbosity - arranging ideas logically – building coherence - paragraph level and document level - topic sentence - cohesive devices – transitionals – paraphrasing – précis-writing. Mechanics of Writing: Stylistic elements – the rapporteur- the purpose- the reader (audience) -elementary rules of grammar- choice of diction - elementary principles of composition - matters of form – punctuation - conventions of business communication -language and tone - weak links in business correspondence - ethical concerns in business writing.

UNIT-II: Reports:

Parts of the Report: Writing an abstract - features of a good abstract – approach - compare and contrast - cause and effect. Types of Technical Reports : Drafting a technical proposal - formal and informal proposals - factual reports, feasibility reports, survey reports – parts of a report - title page –declaration – acknowledgements – table of contents - abstract – introduction – conclusion – citations – references - appendices - oral reports and presentations.

UNIT-III: Letter-Writing:

Formal and informal letters - structure of formal letters - expressions of salutations, introductory and concluding paragraphs - different types of letters - sales letter - complaint letter - adjustment letter - letter to the editor - covering letter - claim letter – letter of condolence.

UNIT-IV: Business Correspondence:

E-mail – nature and scope - e-mail etiquette – Common Errors in composing e-mails – Quotations - Inviting quotations - sending quotations –placing orders. Office Communication - agenda - notice – circular. Effective Resume-Writing: Structure and presentation - defining career objective - projecting one's strengths and skill-sets. Summarizing - formats and styles - covering letter.

UNIT-V: Business Proposals:

Drafting business proposals - calculating profit and loss-averages - ratios and proportions – partnership - simple interest - compound interest - calculating volumes and areas. course of action - cause and effect- theme detection - making judgments - logical deductions - analyzing arguments – syllogisms - Venn diagrams - matching definitions -verbal reasoning - numerical reasoning - working out justifications.

I SEM & II SEM

IV Year I Semester

L	T	P	To	C
4	-	-	4	4

AE 423 AUTOTRONICS

Course Description & Objectives:

Students will learn concepts and develop basic skills necessary to diagnose automotive electrical problems while, starting, charging, lighting systems, advanced automotive electrical systems etc.

Course Outcomes:

On successful completion of this course students will be able to:

1. *recognise and understand the different wiring diagrams used in manufacturer's workshop manuals.*
2. *identify the various modules and sensors from the wiring diagrams.*
3. *determine the function and operation of the various modules and sensors and have a good knowledge of how they are used in the management of the vehicle control.*
4. *communicate with the customer and the technician as to the faults observed and how it can be rectified.*
5. *understand the various functions of the sensors and actuators in the field of automotive applications.*

UNIT – I: Introduction to automotive electrical systems:

Automotive generation, storage & distribution systems, wiring harness, circuit diagrams and symbols, 12/24/42 volt system, positive earth and negative earth, earth return and insulated return systems, Multiplexed wiring systems, Electromagnetic compatibility, Electromagnetic interference, Controlled Area Networks (CAN)

Battery : Types, Principle of lead acid battery, Constructional details, Recharging the battery, Battery ratings, Battery Performance, Battery capacities, Battery efficiency, Battery tests, Battery failures, Alkaline battery, maintenance free batteries, hybrid batteries

UNIT – II: Charging Systems & Regulators:

D.C. Generators, A. C. Generators, Magnetos Constant current & voltage systems, Current & voltage regulator, Semi conductor type regulator, Regulator for alternators

Starting Systems: Requirements of Starting system, starting system layout, selection of motor, matching battery, Drive mechanisms, Permanent magnet motors

UNIT – III: Ignition systems:

Introduction, types, Ignition coil, Distributor, Cam angle & Contact angle gap, Advance mechanisms, Ballast Resistance, Limitations of coil ignition,

Transistorized Ignition systems, Spark plugs, types, construction.
Lighting systems: Fundamentals, Headlight, types, lighting circuits, interior lighting, signaling, LED lighting, Gas discharge lighting.

UNIT – IV: Automotive Equipments& Accessories:

Fuel gauge, oil pressure gauge, Temperature gauges, Speedometer, Warning Lights, Electric Horn, Horn Relay, Wind Shield wipers, Heaters & defrosters, Electric windows.
Automotive Sensors & Actuators: Actuators, Air-flow rate sensor, angular position sensor, Throttle angle sensor, Temperature sensor, Knock sensor, Pressure sensor. Feedback for engine control, Solenoid actuators, motorized actuators.

UNIT – V : Automotive Electronic Systems:

Electronic Ignition systems, Electronic injection systems, Antilock brake system circuit, Traction control, Electronic control of automobile transmission, Active suspension, Engine management system, ESP 06.

Electric and hybrid vehicles: Types, Energy sources – batteries, Fuel cells, Solar and Hydrogen, Electric machines and controllers, Design considerations, challenges and recent developments.

AE 425 AUTOMOTIVE EMISSION & CONTROL

Course Description & Objectives:

To develop the basic knowledge of the students in automobile engines pollution formation & control techniques, measurement techniques and to make them understand the social, cultural, global and environmental responsibilities of the professional engineer, and the principles of sustainable design and development.

Course Outcomes:

On successful completion of this course students will be able to:

1. *understand the emission and its effect on human health and environment.*
2. *know about the formation of pollutant in si engine.*
3. *understand the formation of pollutant in ci engine*
4. *have knowledge on emission control techniques.*
5. *understand the emission measurement techniques, emission standards and various test procedure*

UNIT – I: Introduction:

Emissions - sources of emission, effect of pollution on human health. Emission norms - Euro & Bharat emission regulations and emission test cycles.

UNIT – II: Emissions From SI and CI Engines:

Emission formation in SI and CI engines – causes for emissions, engine modifications to reduce emissions, role of fuels in engine emission, effect of fuel properties and additives on emissions, emissions from LPG, CNG, alcohols, bio fuels.

UNIT – III: Emission Measurement and Control Techniques:

Crank case emission control, fuel evaporation & control, EGR, intake temp control, air injected exhaust, thermal reactors, SCR, catalytic converters – types, catalytic mechanism, tuning of mechanical systems - A/F ratio control. NDIR analyzer, flame ionization detectors, chemiliuminescent analyzer, smoke meters, gas chromatograph.

UNIT – IV: Noise Control:

Identification of noise sources, quantification, control of air borne noise - use of noise absorber, barrier, different materials, criteria for the selection of materials, control of structure borne noise - treatments for vibration damping materials for hood liner and head liner, resonance and ill effects of resonance.

Characteristics of vehicle noise, sources of vehicle noise, engine noise, techniques for locating and measuring engine noise, engine noise control techniques, inlet and exhaust noise mechanism and control, noise from cooling system, transmission noise and tyre noise. Anechoi chamber.

UNIT – V: Vibration Control:

Introduction, vibration analysis, sources of vibration, damping of vibration, rubber mountings, vibration isolation and absorption. Constrained and extensive layer dampings. Engine and drivetrain vibrations, vehicle and chassis vibration.Application of plastics and composites in automobiles.

TEXT BOOKS:

1. John B Heywood, "Internal Combustion Engine Fundamentals", 2nd ed., McGraw Hill International ed.s, 1988.

	3	1	-	4	4

AE 427 AUTOMOTIVE SYSTEM DESIGN

Course Description & Objectives:

To analyze the stress and strain on transmission components; understand, identify and quantify failure modes for the parts and to impart knowledge on classification types, functions, materials used, constructional details, methods of manufacturing and troubles & remedies.

Course Outcomes:

Upon the successful completion of the course, learners will be able to

1. *select and design a suitable clutch for the drive system.*
2. *select suitable gear ratio and number of speeds to design the gear box for any system.*
3. *estimate the load, moment and stresses on frame members and suspension.*
4. *estimate the load, moment and stresses on front axle and steering system.*
5. *estimate the load, moment and stresses on final drive and rear axle*

UNIT – I: Considerations in design:

Statistics in design, design for natural tolerances, statistical analysis, mechanical reliability.

Design of clutches: Design requirements of friction clutches, selection criterion, torque transmission capacity, lining materials, Design of single plate clutch, multi-plate clutch and centrifugal clutch.

UNIT – II: Design of gearbox and final drive:

Selection of gear ratios & final drive ratio, Design of gears, shafts, splines and housing, selection of bearings. Design of final drive & differential gearing, Selection of wheels and tyres.

UNIT – III: Design of brake, axle systems:

Design of hydraulic braking system, Internal expanding shoe brake and disc brake. Design of axles & propeller shafts: Design of front & rear axles, Design of propeller shafts for bending, torsion & rigidity, Design of universal joints and slip joints.

UNIT – IV: Design of suspension System:

General design considerations of suspension system, Design of leaf springs for automobile suspension system, Design considerations of Belleville springs, Elastomeric springs, Air (Pneumatic) springs.

UNIT – V: Optimization:

Introduction to design optimization of mechanical elements, adequate & optimum design, methods of optimization, Johnson's method of optimum design-Simple problems in optimum design like axially loaded members, shaft subjected to torsional and bending moments and other machine elements.

TEXT BOOKS:

1. Joseph E. Shigley& Larry D. Mitchell, 'Mechanical Engineering Design', Fourth ed., McGraw-Hill International Book Company, 2007.

AE429 INDUSTRIAL ECONOMICS & MANAGEMENT

Course Description & Objectives:

To equip the student to make decisions in the industry considering the economic, managerial aspects.

Course Outcomes:

On completion of the course, the student would be able to:

1. *understand various aspects other than technical like financial, marketing, and industrial safety*
2. *know the labour acts that play a critical role in the successful product delivery.*
3. *appreciate the economics of engineering management for optimum product delivery.*

UNIT – I: Functions of Management:

Definition of Management,Characteristics, Objectives, hierarchy,Importance, Forecasting.Organizing – Process &Principles,types. Human Resource management functions.DouglasMcGregor's Theory X and Theory Y, Maslow's hierarchy of human needs.

UNIT – II: Engineering Economics:

Introduction to basic economics terms such as demand and supply, Time value of money, cash flows, depreciation, Types of depreciation, reasons for depreciation, Methods of computing depreciation, sinking fund method, Declining balance method, Investment decisions for capital assets, evaluation criteria for Investment decisions, Payback period, average rate of return.

UNIT – III: Financial Management:

Sources of Finance, financial statements, Balance sheet and P & L Account, Break even Analysis and its applications, accounting ratios. Marketing: Marketing Concepts – Objective –Types of markets, Market Segmentation, Market strategy- 4 P's of market, Market Research, Advertising.

UNIT – IV: Production Management:

Selection of site, plant layout – objectives, principles, types, merits & demerits of different types of layout, PERT / CPM, Work Study, Method study, Work Management.

UNIT – V: Materials Management:

Scope, advantages, functions of materials management, Purchasing objectives, Functions of Purchase department, Purchasing cycle, Purchase procedure, Inventory Control - ABC
Analysis, EOQ.

TEXT BOOKS:

1. Gene Burton and Manab, Thakur, "Management, Today – Principles and Practice" 2nd ed., Tata McGraw Hill Publishing Company, New Delhi, 2000.

AE 431 AUTOMOTIVE AERODYNAMICS (DEPT. ELECTIVE - III)

Course Description & Objectives:

The subject aims to provide guidance to industry on reducing the aerodynamic drag in heavy truck vehicles, develop innovative drag reducing concepts that are operationally and economically sound and establish a database of experimental, computational, and conceptual design information

Course Outcomes:

On successful completion of this course students will be able to:

1. *evaluate basic fluid theory.*
2. *apply cfd to a range of problems.*
3. *understand lift, drag and down force definitions and calculations.*
4. *demonstrate a knowledge and understanding of aerodynamics in automotive field.*
5. *understand the principles and functions of wind tunnel.*

UNIT – I: Introduction:

Scope, historical developments, fundamentals of fluid mechanics, flow phenomenon related to vehicles, external and Internal flow problem, resistance to vehicle motion, performance, fuel consumption and performance potential of vehicle aerodynamics, engine cooling requirement, air flow to passenger compartment, duct for air conditioning, cooling of transverse engine and rear engine.

UNIT – II: Aerodynamic drag of Cars:

Cars as a bluff body, flow field around car, drag force, types of drag force, analysis of aerodynamic drag, drag coefficient of cars, strategies for aerodynamic development, low drag profiles.

UNIT – III: Shape Optimization of Cars:

Front end modification, front and rear wind shield angle, boat tailing, hatch back, fast back and square back, dust flow patterns at the rear, effects of gap configuration, effect of fasteners.

UNIT – IV: Vehicle Handling:

Origin of forces and moments on a vehicle, lateral stability problems, methods to calculate forces and moments – vehicle dynamics under side winds, the effects of forces and moments, characteristics of forces and moments, dirt accumulation on the vehicle, wind noise, drag reduction in commercial vehicles.

UNIT – V: Wind Tunnels for Automotive Aerodynamics:

Introduction, principle of wind tunnel technology, limitation of simulation, stress with scale models, full scale wind tunnels, measurement techniques, equipment and transducers, road testing methods, numerical methods.

TEXT BOOK:

1. Hucho W H, "Aerodynamic of Road vehicles", 2nd ed., Butterworth Co. Ltd., 1997.

IV Year I Semester	L	T	P	To	C
	3	1	-	4	4

ME 322 FINITE ELEMENT METHODS (DEPT. ELECTIVE - III)

Course Description & Objectives:

Course aims to equip the students with the Finite Element Analysis fundamentals, to introduce domain discretization, polynomial interpolation, application of boundary conditions, assembly of global arrays, and solution of the resulting algebraic systems.

Course Outcomes:

Upon completing this course, the students will be able to:

1. *identify mathematical model for solution of common engineering problems.*
2. *formulate simple problems into finite elements.*
3. *solve structural, thermal and fluid flow problems.*
4. *derive element matrix equation by different methods and applying basic laws in mechanics and integration by parts.*
5. *solve complicated 3d structural problems for stress analysis under impact loads.*

UNIT – I: Finite Element Analysis:

Historical background - weighted residual methods-basic concept of fem - variational formulation of B.V.P.- Ritz method-finite element modeling - element equations - linear and quadratic shape functions - bar, beam elements - applications to heat transfer.

UNIT – II: Finite Element Analysis of 2D Problems:

Basic boundary value problems in 2 dimensions-triangular, quadrilateral, higher order elements - poissons and laplace equation - weak formulation - element matrices and vectors-application to solid mechanics, heat transfer, fluid mechanics.

UNIT – III: ISO-Parametric Formulation:

Natural co-ordinate systems - lagrangian interpolation polynomials - soparametric elements – formulation - numerical integration - 1D, 2D, triangular elements - rectangular elements - illustrative examples.

UNIT – IV: Solution to Plane Elasticity Problems:

Introduction to theory of elasticity-plane stress-plane strain and axisymmetric formulation principles of virtual work, consistent and lumped formulation-use of local co-ordinates, element matrices using energy approach.

UNIT – V: Special Topics:

Dynamic analysis – equation of motion - mass matrices - free vibration analysis - natural frequencies of longitudinal - transverse and torsional vibration - introduction to transient field problem - non linear analysis - use of softwares - h and p elements - special element formulation.

TEXT BOOKS:

1. Chandraputla, Ashok and Belegundu , "Introduction to Finite Elements in Engineering", 3rd ed., PHI Publishers, 2009.

IV Year I Semester

L	T	P	To	C
4	-	-	4	4

ME 423 ROBOTICS (DEPT. ELECTIVE - III)

Course Description & Objectives:

The objective of this course is to establish an understanding of robot anatomy, design and synthesis of manipulator mechanism, kinematics, end effector, trajectory planning, machine vision, real world interface and problem associated with their design.

Course Outcomes:

Students would be able to:

1. *get an idea to be familiar with the automation and brief history of robot and construction of a manipulator.*
2. *familiarize with the kinematics of robots and basics of robot control systems.*
3. *know about robot end effectors, their design and their pros and cons.*
4. *know about various Sensors, their applications in robots and a brief understanding of robot vision.*
5. *understand a wide knowledge about the various real world and industrial application or robot in the current days.*

UNIT – I: Concepts on robotics:

Definition of automation-programmable automation - flexible automation - Definition of a Robot - Basic Concepts - Robot configurations – characteristics of robots – accuracy and repeatability-load carrying capacity - Actuators - Basic robot motions - Point to point control - Continuous path control.

UNIT – II: Control systems:

Basic control system concepts – control system analysis – robot actuation and feed back,Manipulators – direct and inverse kinematics – the Denavit-Hartenberg Transformation Method – Coordinate transformation.

UNIT – III: End effectors:

End effectors. Types of Robot end effectors – Grippers, tools as end effectors – End effectors interfacing. Automated Manufacturing Work Cell – Concepts and Design.

UNIT – IV: Sensors:

Range sensing - Proximity sensing - Touch sensing - Force and Torque sensing. Introduction to Machine vision - Sensing and digitizing – Image processing and analysis. Encoders - tachometers.

UNIT – V: Applications:

Application and characteristics of robots in machining - Welding – Assembly - Material handling -Loading and unloading – spray painting - inspection – forging -medical surgery - CIM.

	4	-	-	4	4

AE 435 PRODUCT DATA MANAGEMENT & COLLABORATIVE PRODUCT COMMERCE (DEPT. ELECTIVE - IV)

Course Description & Objectives:

The subject introduces the various concepts involved in the successful launch of a new product starting from design to delivery and also the services required over the entire life cycle of an automobile product in particular.

Course Outcomes:

Upon the successful completion of the course, learners will be able to

1· *summarise the various trends affecting product decision*

2· *identify the requirements to create new product.*

3. *compare different techniques involved in design creation and design testing.*
4. *rephrase the methods of model creation and integration between software and hardware.*

UNIT – I: Introduction:

Product development process and functions-present market constraints-need for collaboration use of internet class technologies and data transfer, variants of e-commerce.

UNIT – II: Product Life Cycle:

Concept of product life cycle management and the benefits, value addition to customer. Lifecycle models, concepts on roles, users and project management, system administration, access control and its use in life cycle.

UNIT – III: Automating Business Process:

Work flows, life cycle-work flow integration, product configuration, product structure. configuration management and change management.

UNIT – IV: CAD Integration in PDM:

Use of CAD neutral visualization tools in product development, Examples, tools used for integration of CAD systems with PDM/PLM systems.

UNIT – V: ERP System:

Integration with PDM – use of I middleware in integrating business applications in product development. Software: PDM/CPC/PLM software and their comparison.

TEXT BOOKS:

1. Michael Grieves, “Product Life Cycle Management”, 3rd ed., Tata McGraw Hill, 2006.

AE 437 TRANSPORT MANAGEMENT (DEPT. ELECTIVE – IV)

Course Description & Objectives:

Students undergoing this course are expected to manage a transport fleet and their related activities for minimizing operational cost and have the knowledge about the motor vehicle acts, insurance& taxation regulations etc.

Course Outcomes:

Upon the successful completion of the course, learners will be able to:

1. *apply the principles of personnel management*
2. *describe the various transport systems and advantages of motor transport.*
3. *assess the operating costs for transport vehicles and estimate the fare structure.*
4. *apply the motor vehicle act in fleet management*
5. *apply the various maintenance activities to vehicles*

UNIT – I: Motor Vehicle Act:

Short titles & definitions, Laws governing to use of motor vehicle & vehicle transport, Licensing of drivers & conductors, Registration of vehicle, State & interstate permits, Different types of RTO forms, Rules regarding construction of motor vehicles, Central Motor Vehicle Rules & amendments, Government administration structure - Organization & management of motor vehicle department, Traffic rules, Signals & controls, responsibility of driver, Public relations & public authorities, Accidents, Causes & analysis, Liabilities & preventive measures, Offences, penalties & procedures, Personnel, Authorities & duties.

UNIT – II: Taxation & Insurance:

Objectives, Bombay Motor Vehicle Taxation Act, Structure & methods of laving taxation, Onetime tax, Tax exemption & tax renewal. Insurance: Significance & types of insurance, Comprehensive, Third party insurance, Furnishing of particulars of vehicles involved in accident, Award of the claims tribunal, MACT (Motor Accident Claims Tribunal), Solatium Fund, Hit & run case, accident claims & survey report including post accident procedures, Duty of driver in case of accident, Surveyor & Loss Assessor.

UNIT – III: Passenger Transport Operation:

Structure of passenger transport organizations, introduction to road corporation act, Typical depot layouts, requirements, Problems on fleet management, Fleet maintenance, Bus & Crew Scheduling, significance of Motor Transport Workers act, personnel & training - training for drivers & conductors, Public relations, passenger amenities, advertisement work, Theory of fares, Basic principles of fare charging, Differential rates for different types of services, Depreciation & debt charges, operation cost, Revenues, Economics & records. Management Information System (MIS) in passenger transport operation.

UNIT – IV: Goods Transport Operation:

Structure of goods transport organizations, scheduling of goods transport, Freight calculations, Management Information System (MIS) in goods transport operation, storage & transportation of petroleum products.

UNIT – V: Advance Techniques in Traffic Management:

Vehicle & traffic navigation system, global positioning system, advanced traffic control devices, Intelligent Transport System.

TEXT BOOKS:

1. Motor Vehicle Act - Govt. of India Publications.
2. Santosh Sharma, "Productivity in Road Transport", 2nd ed., Association of State Road Transport Undertakings, New Delhi.

AE 439 NEW GENERATION AND HYBRID VEHICLES (DEPT. ELECTIVE – IV)

Course Description & Objectives:

To illustrate the new generation vehicles and their operation and controls.

Course Outcomes:

Upon completion of this course the student will be familiar in the recent developments:

1. *pertaining to energy system, vehicle operation, and newer vehicles.*
2. *on the area of suspension systems, brakes, aerodynamics etc*

UNIT I: Introduction:

Electric and hybrid vehicles, flexible fuel vehicles (FFV), solar powered vehicles, magnetic track vehicles, fuel cells vehicles.

UNIT II: Power System and New Generation Vehicles:

Hybrid Vehicle engines, Stratified charge engines, learn burn engines, low heat rejection engines, hydrogen engines, HCCI engine, VCR engine, surface ignition engines, VVTI engines. High energy and power density batteries, fuel cells, solar panels, flexible fuel systems.

UNIT III: Vehicle Operation and Control:

Computer Control for pollution and noise control and for fuel economy – Transducers and actuators - Information technology for receiving proper information and operation of the vehicle like optimum speed and direction.

UNIT IV: Vehicle Automated Tracks:

Preparation and maintenance of proper road network - National highway network with automated roads and vehicles - Satellite control of vehicle operation for safe and fast travel, GPS.

UNIT V: Suspension, Brakes, Aerodynamics and Safety:

Air suspension – Closed loop suspension, compensated suspension, anti skid braking system, retarders, regenerative braking, safety gauge air backs-crash resistance. Aerodynamics for modern vehicles, safety systems, materials and standards.

TEXT BOOKS:

1. Heinz, “Modern Vehicle Technology” Second Edition, Bu
2. Bosch Hand Book, SAE Publication, 2000

REFERENCES:

1. Light weight electric for hybrid vehicle design.

2. Advance hybrid vehicle power transmission, SAE.
3. Noise reduction, Branek L.L., McGraw Hill Book company, New York, 1993.

AE 441 AUTOMOTIVE TESTING LAB

Course Description & Objectives:

Students undergoing this practical course are expected to know the fuel system equipments like Carburettors, and fuel supply and know the Ignition system, vacuum test, Valve clearance, ignition system, charging Nozzle testing.

Course Outcomes:

The students will be able to test and repairs carburettors for checking the various parameters, ignition system and nozzle testing for optimum working and servicing of alternator and starting system.

List of Experiments:

1. Engine component measurements.
2. Carburetor trouble shooting and servicing.
3. Ignition system trouble shooting and servicing.
4. Compression and vacuum test on petrol engine.
5. Valve clearance adjustment.
6. Nozzle testing and servicing.
7. Battery testing.
8. Servicing of alternator and starting system trouble shooting
9. Morse test.
10. Exhaust gas emission measurement on diesel and petrol engine.

IV Year I Semester

L	T	P	To	C
-	-	3	3	2

AE 443 AUTOTRONICS LAB

Course Description & Objectives:

Students undergoing this practical course are expected to know the electrical equipments like starter motor, and alternator and the batteries, wiring system, lighting system, ignition system, charging system. They would understand the basics of electronics, rectifiers, filters and logic gates.

Course Outcomes:

The students will be able to test and repair batteries for various parameters, starter motor, Alternator and electronic ignition system for correct working and rectifiers, head light, filters, A/D convertors for optimum operation.

List of Experiments:

1. Demonstration of automotive electrical and electronic systems layout
2. Demonstration of battery charging & battery testing
3. Demonstration and testing of alternators
4. Demonstration & testing of starting motors
5. Demonstration of electronic ignition system
6. Demonstration of dash board panel instruments & controls
7. Demonstration of headlight beam alignment
8. Testing of auto electrical components on multifunction tester
9. Testing of CDI coil, spark plug and armature
10. Demonstration of microcontroller 8051
11. Demonstration of electric bike and hybrid vehicle
12. Demonstration of ECU diagnostic system

IV Year I Semester

L	T	P	To	C
-	-	3	3	2

AE 445 DESIGN ANALYSIS AND SIMULATION LAB

Course Description & Objectives:

To develop the practical knowledge in the field of automobile component designing and to impart the fundamental knowledge in designing and drafting.

Course Outcomes:

On successful completion of this course students will be able to understand the complete methodology of design &drafting and develop skills in designing the automobile engine components using software like AutoCAD.

List of experiments:

1. **Drafting:** Development of part drawings for various components in the form of orthographic and isometric. Representation of Dimensioning and tolerances scanning and plotting. Study of script, DXE AND IGES FILES.

2. **Part Modeling:** Generation of various 3D Models through Protrusion, revolve, shell sweep. Creation of various features. Study of parent child relation. Feature based and Boolean based modeling surface and Assembly Modeling. Study of various standard Translators. Design simple components.

3.
   a) Determination of deflection and stresses in 2D and 3D trusses and beams.

   b) Determination of deflections component and principal and Von-mises stresses in plane stress, plane strain and Axisymmetric components.

   c) Determination of stresses in 3D and shell structures (at least one example in each case)

   d) Estimation of natural frequencies and mode shapes, Harmonic response of 2D beam.

   e) Steady state heat transfer Analysis of plane and Axisymmetric components.

4.

a) Development of process sheets for various components based on tooling Machines.

b) Development of manufacturing and tool management systems.

c) Study of various post processors used in NC Machines.

d) Development of NC code for free form and sculptured surfaces using CAM packages.

e) Machining of simple components on NC lathe and Mill by transferring NC Code / from a CAM package. Through RS 232.

f) Quality Control and inspection.

AE 422 AUTOMOTIVE AIRCONDITIONING

Course Description & Objectives:

The subject aims to discuss principles and the various processes of air conditioning, the thermodynamics involved and optimal design of the various subsystems and methods to distribute conditioned air in the space.

Course Outcomes:

On successful completion of this course students will be able to:

1. *understand the laws of thermodynamics and basic refrigeration cycles.*
2. *know about the refrigerants, refrigeration equipments.*
3. *understand the psychrometric tables and charts, processes, combinations and calculations.*
4. *have knowledge on heating and cooling load calculation.*

UNIT – I: Review of Thermodynamics:

Laws, General equations, Processes, Equations applied to processes, definitions & methods of refrigeration. Basic Refrigeration Cycles: Carnot cycle, Reversed Carnot cycle, Simple Vapour compression cycle, sub-cooling, superheating, Liquid to suction vapour heat exchanger, Calculations and performance of above cycles, Actual vapor compression cycle.

UNIT – II: Refrigerants:

Classification, requirements of refrigerants like Thermodynamic, physical, & chemical. Comparison among commonly used refrigerants, Selection of Refrigerants, Effect on Ozone depletion and global warming, Alternative Refrigerants. Refrigeration Equipments: Compressor, Condenser, Evaporator, Expansion devices, Types & performance characteristics, selection, methods of charging and leak testing.

UNIT – III: Psychrometry:

Moist air as a working substance, Psychrometric properties of air, Use of Psychrometric tables and charts, Processes, Combinations and Calculations, ADP, Coil Condition line, Sensible heat factor, Bypass factor. Comfort: Thermal exchange between human body and environment, factors affecting comfort, effective temperature comfort chart, ventilation requirements, outside & inside design conditions.

UNIT – IV: Heating and Cooling Load Calculation:

Representation of actual air conditioning process by layouts and on psychrometric charts, Load analysis RSHF, GSHF, ESHF, Enumeration and brief explanation of the factors forming the load on refrigeration and air conditioning systems, load calculation of automobile vehicle for comfort and transport air conditioning. Energy conservation in air conditioning systems.

UNIT – V: Air Distribution System:

Re-circulated air, Ventilation air, duct system, principle of duct sizing and air distribution, it's norms, diffusers, dampers, layout, duct systems.

TEXT BOOKS:

1. S.C. Arora & Domkundwar, "A Course in Refrigeration and Air Conditioning", 2nd ed., Dhanpatrai& Sons, 2009.
2. Dossat, "Principles of Refrigerations", 2nd ed., Wiley Eastern, 2006.

AE 424 ALTERNATIVE FUELS AND ENERGY SYSTEMS (DEPT. ELECTIVE – V)

Course Description & Objectives:

This subject gives an idea about the depleting nature of the fossil fuels and the importance of tapping some alternatives to that and the various alternatives like solar, wind energy and the energy generation from hydrogen, fuel cells, bio conversion are introduced and a study about their production is given.

Course Outcomes:

On successful completion of this course students will be able to:

1. *understand the fossil fuel and its effect on human health and environment.*
2. *know about the use of alternative fuels and solar thermal system.*
3. *understand the hydrogen gases and fuel cells.*
4. *have knowledge on solar photovoltaic systems.*
5. *understand the wind energy techniques, bioconversion applications.*

UNIT – I: Fossil fuel:

Impact of fossil fuel based systems, World scenario of Energy Resources, Indian Scenario of Energy Resources - new and renewable energy – sources and features.

Introduction to Alternate Fuels**:** Need for alternate fuel, availability and properties of alternate fuels, general use of alcohols, LPG, hydrogen, CNG.

UNIT – II: Use of alternative fuels:

Modification of engines required for use of alternative fuels. Engine performance and emission characteristics, Limitations and advantages.

Solar Thermal System: Solar potential, Solar radiation spectrum, Solar radiation geometry, Solar radiation data, Radiation measurement, Technologies of thermal energy collection, Types of Solar Collectors, Collection efficiency.

UNIT – III: Hydrogen:

Properties of hydrogen with respect to its utilization as renewable forms of energy, sources of hydrogen, production, transportation, storage, application & economics of hydrogen**.**

Principle, Types, Full cell for Automotive application (PEM), PEM fuel cell stack construction, performance.

UNIT – IV: Solar Photovoltaic systems:

Operating Principle, Photovoltaic cell concepts, Photo-cell materials, Cell module array, Series and parallel connections, Applications & applications related to automobiles. Hybrid vehicles.

UNIT – V: Wind Energy:

Wind parameters and wind data, Power from wind, Site selection, Wind energy conversion systems and their classification, Construction and working of typical wind mill, characteristics of wind generators, Design considerations for wind mills.

Bioconversion: Introduction, biological & biochemical conversion, Energy plantation, Combustion and fermentation, anaerobic digester, Biomass gasification, Pyrolysis, various applications of Biomass energy, Bio-fuel – Relevance, types, and applications.

AE 426 MOTOR SPORT ENGINEERING (DEPT. ELECTIVE – V)

Course Description & Objectives:

The course should enable the students to gain knowledge in introduction to motorsport engineering and able to list out the events and competitions. It will also enable them to develop interest about the national and international events.

Course Outcomes:

The students shall be able to:

1. *Understand the advantages of motorsports industry.*
2. *Brief about the events and competitions*
3. *Take part in national and international events*
4. *Apply knowledge to design and built the vehicle as per the rules and regulations.*
5. *Execute and make themselves as a flagship engineer in motorsport industry.*

UNIT 1 – Introduction to Motorsport Engineering:

The history of motorsport engineering-Review of motorsport engineering-Pioneers of Motorsport engineering -Motorsport technology evolution review-Secrecy in Motorsport engineering

UNIT 2 – List of Motorsport Competitions for Students:

A brief look at all the events students can take part to develop their skills - Formula SAE - Baja SAE - SAE Super mileage.

UNIT 3 – Professional Motorsport Events:

The various types of professional motorsport events that take place around the world - Cars – Formula One, World rally championship, Touring car championship, GP2, GP3, World Endurance Racing Championship, dirt track racing, NASCAR, Indy Car, Cross Country rallies, drag racing - Motorcycles – MotoGP, Superbike, Endurance, Motocross, Supermoto, Freestyle, Trials, Cross-country rallies, Speedway, Board track, drag racing.

UNIT 4 – Rules and Regulations of Motorsports:

All about the most important book for a motorsport engineer – the rule book - About – the world governing bodies of the sport - Why the rule book keeps changing - How to interpret the rule book- Rules for car races - Rules for bikes races

UNIT 5 – Career in Motorsports:

A sneak peek into all the awesome jobs- Motorsport Engineer Race Driver / Rider – Test Driver / Rider - Design engineer - Race technician -Aerodynamics Engineer - Race official / steward.

ME 326 COMPUTATIONAL FLUID DYNAMICS (DEPT. ELECTIVE - V)

Course Description & Objectives:

Students will be taught to appreciate how computers are used to perform millions of calculations required to simulate the interaction of fluids and gases with the complex surfaces used in engineering.

Course Outcomes:

1. *understand the process of developing a geometrical model of the flow, applying appropriate boundary conditions, specifying solution parameters, and visualizing and analyzing the results.*
2. *become conscious of the limitations of cfd and develop an appreciation for the factors limiting the accuracy of cfd solutions.*
3. *to develop an understanding for the major theories, approaches and methodologies used in cfd and apply it to numerically solve the governing equations for fluid flow*
4. *to build up the skills in the actual implementation of cfd methods (e.g. boundary conditions, turbulence modelling etc.)*
5. *understand and apply finite difference and finite volume methods to fluid flow problems*
6. *understand how to assess stability and conduct a grid-convergence assessment.*

UNIT – I: Governing Equations and Boundary Conditions:

Basics of computational fluid dynamics – Definition and overview of CFD, need, advantages, problem areas, Governing equations of fluid dynamics – Continuity, Momentum and Energy equations –– Physical boundary conditions – Time-averaged equations for Turbulent flow - Turbulence -Kinetic -Energy Equations – mathematical behavior of PDEs in CFD: Elliptic, Parabolic and Hyperbolic equations.

UNIT – II: Discretization and Solution Methodologies:

Methods of Deriving the Discretization Equations - Taylor Series formulation – Finite difference method – Control volume Formulation – Detailed treatment of Finite Difference method, explicit and implicit methods, errors and stability analysis.

Solution methodologies: The Lax-Wendroff Technique, MacCormack's Technique, Space marching, Direct and iterative methods, Thomas algorithm, Relaxation method, Alternating Direction Implicit method.

UNIT – III: Heat Conduction:

Finite difference and finite volume formulation of steady/transient one-dimensional conduction equation, Source term linearization, Incorporating boundary conditions, Finite volume formulations for two and three dimensional conduction problems.

UNIT – IV: Convection and Diffusion:

Finite volume formulation of steady one-dimensional convection and Diffusion problems, Central, upwind, hybrid and power-law schemes - Discretization equations for two dimensional convection and diffusion.

UNIT – V: Calculation of Flow Field:

Representation of the pressure gradient term and continuity equation - Staggered grid - Momentum equations - Pressure and velocity corrections - Pressure - Correction equation, SIMPLE algorithm and its variants.

EE 319 LINEAR CONTROL SYSTEMS (DEPT. ELECTIVE - VI)

Course Description & Objectives:

This course is to explore the modeling of linear dynamic systems via differential equations and transfer functions utilizing input-output representations; analysis of control systems in the time and frequency domains and using transfer function and state-space methods

Course Outcomes:

On completion of the course, the students would be able to:

1. *able to formulate mathematical models of physical systems and represent them in block diagrams and signal flow graphs*
2. *able to analyze the words transient & steady state performance of a system.*
3. *able to understand the stability of an electrical, electronics and other physical systems*
4. *able to design controllers, compensators and control systems*

UNIT – I: Introduction:

Concepts of Control Systems - Open Loop and closed loop control systems and their differences - Different examples of control systems - Clasification of control systems.

Mathematical Models of Physical Systems: Differentical equations - transfer functions and block diagram representation of systems considering electrical systems as examples Block diagram algebra -Representation by Signal flow graph - reduction using Mason's gain formula - translational and rotational mechanical systems.

UNIT – II: Feed-Back Characteristics:

What is Feedback? Effects of feedback - reduction of parameter variations by use of feedback-Control over system dynamics - by the use of feedback. **Elements of Control Systems:** DC Servo motor - AC Servo motor - Synchro transmitter and Receiver

UNIT – III: Time Response Analysis:

Standard test signals - Time response of first order systems - Characteristic Equation of Feedback control systems, Transient response of second order systems - Time domain specifications - Steady state response - Steady state errors and error constant. **Concepts of stability:** The concept of stability, Routh stability criterion

UNIT – IV: Root Locus Technique:

The root locus concept - construction of root loci. **Frequency Response Analysis:** Introduction, Frequency domain specifications - Bode diagrams - Determination of Frequency domain specifications from the Bode Diagram - Phase margin and Gain margin - Stability Analysis from Bode Plots. Polar Plots, Nyquist Plots and Nyquist stability criterion

UNIT – V: Design and Compensation Technique:

Introduction and Preliminary design considerations - Lead, Lag, Lead-lag. PID controller. **State Space Analysis of Continuous Systems :** Concepts of state, state variables and state model, derivation of state models from block diagrams, Diagonalization - Solving the Time Invariant state Equations - State Transition Matrix.

ME 328 MECHATRONICS (DEPT. ELECTIVE - VI)

Course Description & Objectives:

This course gives an overview of Mechatronics systems and their components for evolving hybrid technologies in various applications.

Course Outcomes:

On completion of the course, the student would be able to:

1. *understand basics of signal conditioning.*
2. *know the modelling concepts and response systems.*

3. *know the operation procedures for various actuators in mechanical and electrical systems.*
4. *understand the basics of PLCs in real world situations through case studies.*

UNIT – I: Introduction:

Introduction: to Mechatronics - Multi disciplinary Scenarios, Systems for Measurement and Control. Microprocessor based controllers, Response of Systems.

UNIT - II: Signal Conditioning:

The op-amp, protection, filtering, Wheatstone bridge, digital signals, multiplexers, Data acquisition, Digital signal processing, pulse modulation, displays, magnetic recording, measurement systems, Testing calibration.

UNIT – III: System Modeling & Dynamic Response of Systems:

Introduction to Mathematical Modeling, Building Blocks of Mechanical Systems, Electrical Systems, Fluid Systems and thermal systems. Engineering Systems: Rotational, translational, Electro-Mechanical & Hydraulic-Mechanical. Performance measures of first order & second order systems, Transfer function.

UNIT – IV: Actuation and Operations:

Actuation to Hydraulic and Pneumatic Systems, Mechanical Systems, Electrical Systems, Mechanical Switches, Solid State Switches, Operation of Solenoids, AC, DC & Stepper Motors.

UNIT – V: Microprocessors & PLC's:

Introduction to digital logic - logic gates - applications of logic gates - sequential logic - Applications - Basic structure of PLCs - selection of a PLC - case studies of mechatronics systems - Microprocessor systems - microcontrollers.

TEXT BOOKS :

ME 433 NANO TECHNOLOGY (DEPT. ELECTIVE - VI)

Course Description & Objectives:

This course is intended to develop interest among the students in the area of nano technology and to initiate research inclination.

Course Outcomes:

Upon successful completion of this course, students will be able to:

1. *understand how basic nanosystems work;*
2. *have a sound grounding and expert knowledge in multidisciplinary areas of nanoscience*
3. *use physical reasoning to develop simple nanoscale models to interpret the behavior of such physical systems*
4. *analyse and critically evaluate ideas/information/data and apply relevant scientific principles to solve problems by, for example, creating hypotheses, testing theories and predictions, designing and carrying out experiments and analysing reported data*
5. *be prepared to work in a high tech work force or pursue a research higher degree in nanotechnology*
6. *have a sound grounding in and expert knowledge of the basic sciences relevant to employment or further study in the traditional sciences*
7. *appreciate that there are the relationships and connections across the sciences and non-science disciplines are core to nanotechnology and understand such relationships and connections*
8. *understand the major issues in producing a sustainable nanotech industry.*

UNIT – I: Genesis of Nano Technology:

Introduction - Nano Science - Nano technology - Nano materials - Scope of applications - topics from nature - Basic principles of Nano science and technology - Basics of quantum mechanics - Quantum Nano structures.

UNIT – II: Fabrication of Nano Materials:

Introduction - Nano materials - Properties of Nano materials - Techniques used in Nano technology - Top - Down approach - Bottoms-up approach -

Tools used in Nano technology - Electron Micro Scope - Atomic Force Microscope (AFM). Synthesis of Nano materials.

UNIT – III: Carbon Nano Tubes (CNT):

Introduction - Preparation - Properties - Classification - Fullerens - Applications of Carbon Nano Tubes.

UNIT – IV: Domain Application of Nano Technology:

Introduction - Applications of Nano technology - Environment and Energy - Textiles - Agriculture - Electronics & Communication - Computers - Medicine - Space technology.

UNIT – V: Projected use & Implications of Nano Technology:

Introduction - Assessment of opportunities - Bottlenecks in implementation of Nano technology - Exploration and Economical concerns of Nano technology - Current research activity.

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

It is aimed to offer various analytical as well as numerical methods to solve first and second order ordinary differential equations; to impart the knowledge of partial differentiation; to acquaint with the various methods to solve first and second order partial differential equations; to make the student familiar with applications of first order ordinary differential equations. To make the student to use different mathematical tools of MATLAB related to above concepts.

Course Outcomes:

The student will be able to:

- recognise and solve different types of first order ordinary differential equations.
- find the complementary functions and particular integral of second and higher order ordinary differential equations with constant coefficients.
- apply the knowledge of ordinary differential equations in some instances.
- solve ordinary differential equations, with initial conditions, numerically.
- find the local maxima/minima of given function of two variables.
- eliminate arbitrary constants/functions from given relations to form partial differential equations.
- solve linear and non-linear partial differential equations of standard types.
- classify second order partial differential equations and solve them.

SKILLS:

✓ *Solve given differential equation by suitable method.*

✓ *Compute numerical solutions of differential equation by apt method.*

✓ *Compute maxima/minima of given function.*

✓ *Solve given partial differential equation by appropriate method.*

ACTIVITIES:

- *Differentiate methods to solve given differential equation.*
- *Compute numerical solutions to differential equation and compare the result with MATLAB output.*
- *Compute maxima/minima of given function.*
- *Differentiate methods to solve given partial differential equation.*
- *Estimation of acoustic impedance of a given material.*

UNIT - 1 **L-9, T-3**

FIRST ORDER DIFFERENTIAL EQUATIONS: Variable separable, Homogeneous differential equations, Linear differential equations, Bernoulli's differential equations, Exact and non-exact differential equations.

UNIT - 2 **L-9, T-3**

SECOND ORDER DIFFERENTIAL EQUATIONS: Linear differential equations with constant coefficients, Homogeneous differential equations of second and higher order, Methods to find particular integral when RHS is of the form - e^{ax}, sinax, cosax and x^n.

UNIT - 3 **L-9, T-3**

APPLICATIONS OF FIRST ORDER DIFFERENTIAL EQUATIONS: Orthogonal trajectories (including polar form), Newton's law of cooling, Law of natural growth and decay.

NUMERICAL METHODS TO SOLVE DIFFERENTIAL EQUATIONS: Taylor series method, Picard's method, Euler's and modified Euler's method, Runge-Kutta method.

UNIT - 4 **L-9, T-3**

MAXIMA/MINIMA OF FUNCTIONS OF TWO VARIABLES: Review of partial differentiation - Partial derivatives, Partial derivatives of higher order; Homogeneous function, Euler's theorem, Total differential coefficient, Maxima and Minima of a function of two variables, Conditions for extreme values, Lagrange method of undetermined multipliers.

JACOBIANS : Definition, Properties, Jacobian of implicit functions.

UNIT - 5 **L-9, T-3**

PARTIAL DIFFERENTIAL EQUATIONS: Formation of partial differential equations, Linear (Lagrange) equations, Method of multipliers, Non-linear partial differential equations (Types), Charpit's method, Second order linear equations with constant coefficients only, Classifications, Rules to find complimentary function and particular integral (special cases).

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours-30

1. Basic mathematical operations using MATLAB.
2. Solving simple expressions.
3. Limits.
4. Continuity.
5. Symbolic differentiation.
6. Symbolic integration.
7. Plotting of curves.
8. Plotting of surfaces.
9. Maxima & minima of functions of one variable.
10. Maxima & minima of functions of two variable.
11. Solving first order O.D.E.
12. Euler's Method and R-K Method.

16HS102 ENGINEERING PHYSICS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	10	-	10

Course Description and Objectives:

Technology is the experimental information for the physicist, where the theories can be tested. Recent technical developments have been the results of collaboration of physicists and engineers.

Study of engineering physics is a unique opportunity to learn the fundamental concepts of physics and apply this knowledge to both scientific and engineering problems.

The present course deals with various fields such as Lasers, Optical fibers, Photonics, Nano and functional materials, make the students to enrich basic knowledge in various fields of physics and apply the same in engineering fields.

Course Outcomes:

The student will be able to:

- understand the applications of ultrasonics and to calculate the velocity of ultrasonic waves in liquids.
- acquire basic knowledge in Non-destructive techniques.
- understand basic concepts of laser and optical fiber which help in designing and developing new devices in emerging fields.
- grasp the basics of quantum mechanics.
- understand the fabrication of solar devices.
- use nano science and technology for innovative and compact design.
- demonstrate synthesis, properties and applications of nanomaterials and functional materials.

SKILLS:

✓ *Determine the velocity of ultrasonics in a given liquid using interferometer.*

✓ *Study the wavelengths of light sources and lasers.*

✓ *Estimate the efficiency of a given solar cell.*

✓ *Learn about the type of the optical fiber and its ability to propagate light waves from its numerical aperture.*

✓ *Know voltage – current characteristics of a given light emitting diode.*

UNIT - 1 **L-9**

ULTRASONICS: Introduction, Production of ultrasonic waves - Piezoelectric method; Properties of ultrasonic waves, Types of ultrasonic waves, Determination of velocity of ultrasonic waves in solids and liquids, SONAR - Medical applications.

NON-DESTRUCTIVE TESTING: Introduction, Types, Visual inspection, Liquid penetrate testing, Ultrasonic Testing Systems, X - Ray radiography.

UNIT - 2 **L-9**

LASERS: Characteristics of laser light, Spontaneous and Stimulated emission of radiation, He-Ne laser, CO_2 laser, Semiconductor laser, Applications.

HOLOGRAPHY: Holography and applications.

FIBER OPTICS: Principle of optical fiber, Acceptance angle, Numerical aperture, Types of fibers, Dispersion and attenuation in optical fibers, Optical fiber communication system, Fiber optic sensors.

UNIT - 3 **L-9**

QUANTUM MECHANICS: Introduction, Matter waves, Schroedinger's time independent wave equation, Physical significance of the wave function, Particle in one dimensional potential well, Tunneling phenomenon.

FREE ELECTRON THEORY OF METALS: Introduction, Classical free electron theory, Electrical conductivity of metal, Quantum free electron theory, Fermi - Dirac distribution function and its variation with temperature.

PARTICLE ACCELERATORS: Introduction, Cyclotron, Synchrocyclotron, Betatron and applications.

UNIT - 4 **L-9**

SOLAR ENERGY: Solar radiation, Photovoltaic effect, Solar cells, Efficiency of solar cell, Solar thermal energy conversion systems.

PHOTONICS: LED, LCD, Photo conducting materials, Photo detectors, Photonic crystals, Non- linear optical behaviour of materials, Applications.

UNIT - 5 **L-9**

NANO MATERIALS: Introduction, Fabrication of nano materials - Ball milling - Sol-Gel method; Physical and chemical properties of nano materials, Applications.

FUNCTIONAL MATERIALS: Smart materials, Shape memory alloys, Chromic materials (Thermo, Photo and electro), Metallic glasses, Advanced ceramics, Composites, Fiber reinforced plastics/metals, Biomaterials.

TEXT BOOKS:

1. V.Rajendran, "Engineering Physics", 7th edition, McGraw Hill Education (India) Pvt.Ltd., 2014.
2. D.K. Bhattacharya and Poonam Tandon, "Engineering Physics", Oxford University Press, 2015.

REFERENCE BOOKS :

1. M.R. Srinivasan, "Engineering Physics", 1st edition, New Age International Publishers, 2008.
2. M.N. Avadhanulu & P.G. Kshirsagar, "Engineering Physics", 1st edition, Chand and Company Ltd., 1992.
3. Sukhatme S.P., "Solar Energy", 2nd edition, TMH publication, 2005.
4. Dr. Arumugam "Materials Science", 3rd edition, Anuradha Publications, 2002.

ACTIVITIES:

- *Estimation of acoustic impedance of a given material.*
- *Measurement of distances using ultrasonic range finder.*
- *Study of linear density of yarn/ fibre using Melde's experiment.*
- *Determination of refractive index of a given liquid using laser.*
- *Find the height of a room using laser.*
- *Identify the type of semi-conductor using Hall effect.*
- *Study of numerical aperture of optical fibres made of different materials.*
- *Design of solar panel to obtain required voltage.*
- *Evaluation of thermal conductivity of materials.*
- *Measure the temperature using thermo couple.*

16HS105 TECHNICAL ENGLISH COMMUNICATION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	15	5	6	4	5

Course Description and Objectives :

To introduce students the specific use of English for the purpose of Technical Communication that would strengthen their skills in the areas of writing and speaking and thereby enable them to function effectively in their professional sphere. The objective of this course is to direct the students towards developing their technical writing skills in particular and overall language proficiency in general. It will be done by making students peruse good samples of technical writing covering a wide range of contemporary issues relevant to the engineering profession. Students will, also be revisiting, the fundamentals of grammar to get trained on use of standard English.

Course Outcomes:

The student will be able to:

- acquire an understanding of the rules of grammar.
- strengthen their reading and listening comprehension skills to follow the academic discourse in the engineering classroom.
- have a command of basic vocabulary related to different subject areas.
- have a grasp on the mechanics of writing and express their ideas through construction of simple texts.
- attain language proficiency to participate in the classroom discussions.

SKILLS:

- ✓ *Apply different sub skills like skimming, scanning, reading for information, reading for inference etc to understand different kinds of text.*
- ✓ *Apply different sub skills like top down, bottom up approaches to listening, and understand phonetic and phonological features of the English language to deconstruct long spoken discourses.*
- ✓ *Use functional vocabulary relevant to subject areas like environment, tourism, engineering, technology and media to express ideas lucidly.*
- ✓ *Use appropriate sentence structure, cohesive devices and diction to construct simple text in writing and regular correspondence like e-mails, letters etc.*
- ✓ *Capture and understand key points during class room discourses through applying sub skills of writing like note-making, paraphrasing and summarizing.*

UNIT - 1 **L-9**

- Text : **ENVIRONMENTAL CONSCIOUSNESS**
  (Climate Change, Green Cover, Pollution, Renewable vs. Non renewable energy sources (from Energy Unit)
- Grammar : Articles, Prepositions, Sentence types and construction
- Vocabulary : Root, Prefixes, Suffixes
- Composition : Paragraph writing (Descriptive and narrative)
- Laboratory
  Practice : Introduction to phonetics (Organs of Speech, Consonants, Vowels and Diphthongs, Syllable, Stress and Intonation)

UNIT - 2 **L-9**

- Text : **EMERGING TECHNOLOGIES**
  (Solar power, Cloud computing, Nanotechnology, Wind energy (to be covered from Energy unit))
- Grammar : Time and tense (Present-past-future; Helping verbs, Modals)
- Vocabulary : Synonyms, Antonyms
- Composition : Letter writing (Informal)
- Laboratory
  Practice : Grammar Practice (Speaking of past, present and future)

UNIT - 3 **L-9**

- Text : **TRAVEL AND TOURISM**
  (Advantages and disadvantages of travel-tourism, Atithi devo bhava, Tourism in India)
- Grammar : Subject-Verb agreement, Sentence construction
- Vocabulary : Idioms and phrases
- Composition : Letter writing (Formal)
- Laboratory
  Practice : Situational conversations – Role - Plays (Introducing, Greeting, Enquiring, Informing, Requesting, Inviting)

UNIT - 4 **L-9**

- Text : **ENGINEERING ETHICS**
  (Challenger disaster, Biotechnology, Genetic engineering, Protection from natural calamities, How pertinent is the nuclear option? An environment of energy (from Energy Unit)) Avoiding sexist language (Gender Sensitization)
- Grammar : Sentence transformation (Degrees, Voice, Speech and Synthesis)
- Vocabulary : Phrasal verbs
- Composition : Note-making, Text, Nandan Nilekani's In Search of Our Energy Solutions (from Energy Unit) Summarizing, Text on "Flight from conversation" (New York Times)
- Laboratory
  Practice : Situational conversations, Role-Plays (Emotions, Directions, Descriptions, Agreements, Refusals, Suggestions)

ACTIVITIES:

- *Doing phonetic transcription of selected words from the list provided using talking dictionaries of AHD and CALD.*
- *Completing graded grammar exercises in Rosetta Stone.*
- *Completing graded listening and reading comprehension exercises in Rosetta Stone.*
- *Watching TED videos and making notes.*
- *Watching TED videos to paraphrase and summarize.*
- *Ad- making.*
- *Preparing brochure.*
- *Dialogue writing followed by role play.*
- *Poster designing.*
- *Team presentation with PPTs and Group Discussion.*

UNIT - 5 **L-9**

- Text : **MEDIA MATTERS**
  (History of media, Language and media, Milestones in media, Manipulation by Media, Thousands march against nuclear power in Tokyo (from Energy Unit), Entertainment media, Interviews)
- Grammar : Common errors
- Vocabulary : One-word substitutes
- Composition : E-mail – Short message service (SMS), Writing advertisements, Reporting; Social media - Blogging, Facebook, Twitter (acceptable and non acceptable content)
- Laboratory Practice : Group discussions – (Topics from Energy Unit), Dumping of nuclear wastes, Exploration of eco-friendly energy options, Lifting of subsidies on petrol, Diesel, LPG etc)

16CS101 BASICS OF COMPUTERS AND INTERNET

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course provides students with a working knowledge of the terminology, processes, and components associated with Computers and Internet. Students will get exposure to Building blocks of Computers, Operating Systems, Application software, Networking, Internet, World Wide Web, Security, Maintenance, Information Systems, and the application development processes.

Course Outcomes:

The student will be able to:

- understand the terms and concepts of Computer Science and Information Technology (hardware, software, networking, security, Internet/Web, and Technologies).
- use the products and services of computers.
- use Internet/Web services as a resource for developing shared applications.
- install different operating systems and application software.

SKILLS:

✓ *Assemble and disassemble the personal computer system.*

✓ *Install different desktop operating systems.*

✓ *Use the basic text processing, simple data analysis and data presentation tools.*

✓ *Configure network parameters.*

✓ *Secure the personal computer and information from various external threats.*

ACTIVITIES:

- *Prepare a report on various generations of computers and its peripherals.*
- *Disassembling and assembling of a personal computer system.*
- *Install the Linux operating system and other software required in a personal computer system.*
- *Connect the system to an Ethernet and configure the same.*
- *Prepare an MS Word Document.*
- *Prepare a spread sheet with various mathematical operations, charts and sorting etc.*
- *Make a report on power point presentation for the given topic.*

UNIT - 1 **L-10**

COMPUTING SYSTEMS: Introduction to computer, Computers for individuals, Importance of computers, Parts of computer system, Memory devices, Input and output devices, Types of monitors, Types of printers, Number systems, Bits and bytes, Text codes and types of processors.

UNIT - 2 **L-10**

OPERATING SYSTEMS: Types of operating systems, User interfaces, PC operating systems, Network operating systems, Types of software, Programming languages, Compiler and interpreter, Program control flow and algorithm.

UNIT - 3 **L-8**

NETWORKS AND DATABASES: Networking basics, Uses of network, Types of networks, Network hardware, Introduction to data bases and database management systems.

UNIT - 4 **L-8**

INTERNET AND WWW: Internet's services, World wide web, Browser setups, Using search engine, Email and other internet applications.

UNIT - 5 **L-9**

CYBER SECURITY: The need of computer security, Basic security concepts, Threats of users, Online spying tools, Threats to data, Cybercrime, Protective measures.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- know the usage of the computer systems.
- setup the IDEs for the computer programming languages.
- get exposure on office automation tools like Microsoft Word, Excel, and power point.
- identify the different computer system and data threats and also protect them by installing antivirus software.

LIST OF EXPERIMENTS Total hours-30

1. Demonstrate the Personal Computer Peripherals and get a report on each peripheral.
2. Demonstrate the Personal computer assembling procedure and do the same.
3. Install wide varieties of free and open source operating systems.
4. Demonstrate Network Interface Card (NIC) configuration and any internet browsers options setup.
5. Demonstrate the Java Development Kit (JDK) installation and environmental variable (PATH) setup.
6. Demonstrate the following experiments using Office automation tools.
   a. Text formatting and table.
   b. Mathematical equations.
   c. Watermarking using Analysis tool.
   d. Calculate student mark details.
   e. Create four types of charts.
   f. Import external data, sort & filter using Power Point tool.
   g. Create text and images with effects.
   h. Create animation and sound effects.
7. Demonstrate the installation of anti-virus software to detect different types of virus programs.

TEXT BOOK :

1. Peter Norton, “Introduction to Computers”, 7th edition, Tata-McGrawHill, 2010.

REFERENCE BOOKS:

1. ITL Education Solution Limited, “Introduction to Computer Science”, 2nd edition, Pearson Education, 2011.
2. Eric Maiwald, “Fundamentals of Network Security”, 3rd edition, Tata-McGrawHill, 2004.

16CS102 COMPUTER PROGRAMMING

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
48	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	5

Course Description and Objectives:

This course is aimed at offering fundamental concepts of programming language to the students. It starts with the basics of C-programming and deals with the structure and various attributes required for writing a 'C' program. It also introduces various operators and control statements used in programming. Then it switches to functions and arrays. It goes on with strings, pointers, files & the user defined data types. As a first-level course in computer science, it forms the basis to understand usage of various attributes in writing a program.

Course Outcomes:

The student will be able to :

- understand the basic terminology used in computer programming to write, compile & debug programs in 'C' language.
- use different data types to design programs involving decisions, loops and functions.
- understand the allocation and Usage of dynamic memory.
- understand the usage of files & structures.

SKILLS:

- ✓ *Identify suitable data types for an application.*
- ✓ *Apply control statements for decision making problems.*
- ✓ *Use multidimension array for matrix application.*
- ✓ *Design a program to calculate average of a class.*
- ✓ *Analyze the difference between static & dynamic memory allocation.*

UNIT - 1 **L-10, T-3**

INTRODUCTION TO C PROGRAMMING: Structure of C program - Comments, Processor statement, Function header statement, Variable declaration statement and Executable statement; C character set, Constants, Identifiers, Operators, Punctuations, Keywords, Modifiers, Identifiers, Variables, C scopes, Basic data types, Type qualifiers, Storage classes, Reading and writing characters, Formatted I/O.

UNIT - 2 **L-9, T-3**

OPERATORS AND CONTROL STATEMENTS: Operators - Assignment, Arithmetic, Relational, Logical, Bitwise, Ternary, Address, Indirection, Sizeof, Dot, Arrow, Parentheses operators; Expressions - Operator precedence, Associative rules; Control statements - Category of statements, Selection, Iteration, Jump, Label, Expression and Block.

UNIT - 3 **L-9, T-3**

FUNCTIONS AND ARRAYS: Function - Declaration, Prototype, Definition, Calling by value and call by address, Standard library functions and Recursive functions; Array - Declaration, Initialization, Reading, Writing, Accessing and Passing as a parameter to functions, 2D-arrays, Multidimensional arrays.

UNIT - 4 **L-9, T-3**

STRINGS AND POINTERS: Strings - Declaration, String library functions, Array of strings, Command line arguments; Pointers - Declaration, Initializing pointers, Multiple indirection, Relationship between arrays and pointers; Scaling up - Array of arrays, Array of pointers, Pointer to a pointer, Pointer to an array; Pointer to functions, Dynamic memory allocation functions.

UNIT - 5 **L-8, T-3**

STRUCTURES AND FILES: Structures - Declaration, Initialization and accessing, Array of structures and passing structures to functions, Structure pointers, Arrays and structures within structures, Unions, Bit-fields, Types and enumerations; Files - I/O and processing operations on text and binary files; Pre-processor directives.

LABORATORY EXPERIMENTS

Course Outcomes:

Upon successful completion of this course, the student will be able to:

- write, compile and debug programs in C language.
- formulate problems and implement algorithms in C.
- develop programming components that efficiently solve computing problems in real-world.

LIST OF EXPERIMENTS Total hours-30

1. Compute the factors of a number.
2. Compute the average of ‘n’ numbers.
3. Find whether a number is palindrome or not.
4. Find whether a number is a power of 2 or not.
5. Compute the factorial of a number.
6. Implement any kind of operation (+,-,*,/,%) using a switch case.
7. Swap two values useing call by value and call by reference.

ACTIVITIES:

- *Implement matrix operations.*
- *Implement malloc and calloc functions.*
- *Copy the content of one file into the other.*
- *Implement string manipulations functions.*

8. Using structure of arrays.
9. Find the reversal of a number.
10. Find the frequency of each number in the array.
11. Which takes 0’s & 1’s as input and the array should consist of all 0’s first and then 1’s.
12. Copy the first 10 words of a file into the other file.
13. Count the number of words in a file.
14. Create a structure which stores the student’s information in a class.
15. Reverse the contents of the array.
16. Implement pointer of pointers.
17. Give n^{th} term of the Fibonacci number.
18. Find the factorial of a number using recursion.
19. Find the number of vowels in a file.
20. Access the structure and union members.

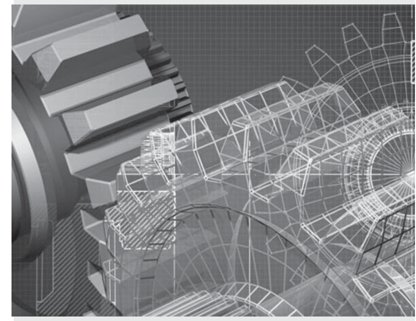
TEXT BOOK:

1. Ajay Mittal, “Programming in C - A practical Approach”, 1^{st} edition, Pearson Education, India, 2015.

REFERENCE BOOKS:

1. Reema Thareja, “Introduction to C Programming”, 2^{nd} edition, Oxford University Press India, 2015.
2. Herbert Schildt, C, “The Complete Reference”, 4^{th} edition, Tata McGraw-Hill, 2000.
3. E. Balagurusamy, “Programming in ANSI C”, 4^{th} edition, Tata McGraw- Hill, 2008.

16EE101 BASICS OF ENGINEERING PRODUCTS



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course enables the students to understand the basics of civil, mechanical, electrical and electronics systems and components used in day-to-day life. It deals with construction materials, power generation principles and working of a few commonly used household appliances. Besides, the student will be able to identify/appreciate various concepts, service and maintainance of engineering products.

Course Outcomes:

The student will be able to:

- gain knowledge and hands-on experience on various engineering products.
- install, operate, maintain and troubleshoot basic mechanical, electrical and electronic appliances.
- understand the concept of conservation of energy.
- gain awareness on choosing appropriate construction materials.

SKILLS:

- ✓ *Identify UPS requirements for a given load.*
- ✓ *Provide a Lighting scheme for specific working environment.*
- ✓ *Design a composition of Heating element for a particular application.*
- ✓ *Trouble shoot issues relating to Immersion Heater and Induction Heater.*
- ✓ *Provide an earthing for Domestic Outlet.*
- ✓ *Select, Configure and maintain a few engineering appliances. Such as TV, Radio, Telephone, Mobile phone, Wifi Router, Micro oven, PA system etc.*

ACTIVITIES:

- *Trouble shooting of immersion heater and induction heaters.*
- *Disassembe and Assembe the Domestic Appliances such as Mixer Grinder, Fan etc.,*
- *Provide Earthing for Domestic Outlet.*
- *Design the Electric Wiring system for a prototype house.*
- *Design the UPS for a defined load.*
- *Practice assembly of a FM radio.*
- *Configure a Wifi Router for required number of users.*

UNIT - 1 **L-9**

WORKING PRINCIPLE OF AC, REFRIGERATOR, PUMPS, IC ENGINES AND SCREW JACK: Working principle of Air - Conditioner and Refrigerator, Components, Assembly and disassembly; Working principle of Centrifugal and Reciprocating pumps - Types, Parts and applications, Working principle of Screw jack and its components, Working principle of IC engines- 2 stroke and 4 stroke.

UNIT - 2 **L-10**

BRICKS: General, Qualities and Classification of bricks, Tests for bricks, Size and Weight of bricks,

Timber - Definition, Qualities of good timber, Decay of timber and Advantages of timber in construction.

CEMENTS: Types and composition of Cement, Setting of cement, Tests for physical properties of

cement, Different grades of cement.

AGGREGATES: Classification of aggregates, Source, Size and Shape of aggregates, Tests for aggregates.

STEEL: Types of steel, Physical properties and Mechanical properties of steel, Simple layout design, Paints, Tiles, fittings, Ventilation, Furniture and green house aspects.

UNIT - 3 **L-8**

ELECTRIC ENERGY SYSTEMS: Overview of Power System Structure, Conventional and Non Conventional Generations, Types of Turbines, Generators, Substations, Towers, Earthing procedure, Protection schemes, Single Phase and Three Phase Systems, Methods of Electrical Wiring Systems, Wiring procedure and calculations, Wiring methods, Un-Interruptible Power Supply (UPS), Components in UPS, Its functionality, Calculation of ratings for UPS components to a specific load.

UNIT - 4 **L-10**

LIGHT: Light Energy, Evolution of Light sources, Working of Incandescent, Fluorescent, MV, SV and LED Lamps, Comparison and Applications.

HEAT: Heat Energy, Modes of Heat Transfer, Resistance and Induction Heating, Comparison and applications.

MOTOR: Electric Motors, Classification, Construction and working principles of motors used in Domestic applications, Mixer grinder, Ceiling and exhaust fan, Hair dryer, Washing machine, Water pump, Air coolers, Vacum cleaner, Computer cooling motor, Electric bike.

UNIT - 5 **L-8**

HOUSE HOLD ELECTRONIC APPLIANCES: Working principles of television, Radio, Remote control, Telephone, Microwave oven, Cell phone, PA system, Induction stove, WiFi router and DTH.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours-30

Demonstration of Modelling / functioning / disassembly / assembly / fault rectification / understanding of the following.

1. Air-conditioners and Refrigerators
2. 2 Stroke and 4 Stroke Engines
3. Reciprocating Pumps
4. Power Screw Jack
5. Size and Water absorption capacity of Bricks
6. Initial and final setting time of Cement
7. Toughness value of coarse aggregates
8. Bulking of Sand
9. Earthing Schemes
10. Electric Wiring
11. UPS system
12. Immersion Heater, Induction Heater and Iron Box
13. Ceiling Fan and Mixer
14. Television
15 Radio
16. Remote Control
17. Telephone
18. Fax Machine
19. Mobile Phone
20. PA System

TEXT BOOKS:

1. M.S.Shetty, "Concrete Technology", 1st edition, S.Chand and Co, 2005.

6. Pravin Kumar, "Basic Mechanical Engineering", 1 st edition, Pearson Publishers, 2013.

16HS104 ENGLISH PROFICIENCY AND COMMUNICATION SKILLS

Hours Per Week :

L	T	P	C
0	-	2	1

Total Hours :

L	T	P
0	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To equip the students with Functional English by exposing them to a wide range of language use in different contexts and thereby encourage them to use the language comfortably in real life situations. The objective of this course is to strengthen the comprehension skills of listening and reading by acquiring adequate vocabulary through perusing authentic materials gathered from news papers, journals and other mass communication media.

Course Outcomes:

The student will be able to:

- use functional English to speak and express themselves in different social contexts
- write simple letters, narratives, factual reports and descriptive passages for both academic and non-academic purposes in English.
- gain proficiency to undergo Preliminary English Test (PET), an Intermediate Level English Certification Test administered by Cambridge English Language Assessment, UK.

SKILLS:

✓ *Use appropriate words in right order for effective sentence formation, and writing short texts.*

✓ *Read and extract information from different texts and draw inferences by understanding elements like tone and transitional words.*

✓ *Understand short and long spoken discourses through analysis of elements like stress and intonation.*

✓ *Articulate clearly thoughts and ideas on simple every day topics.*

UNIT - 1 **P-6**

FUNCTIONS: Introducing Self/Others, Expressing needs/feelings/opinions (SWOT Analysis)

SKILL FOCUS:

Reading – Understanding factual information

Writing – Word order and sentence formation

Listening – Decoding for meaning following elements of stress, Intonation and accent

Speaking – Articulating syllables clearly, Speaking fluently with correct pronunciation

Vocabulary – Discerning to use right word for the given context

Grammar – Spellings, Use of Nouns, Adjectives, Verbs, Prepositions in the sentence structure

PRACTICE: Objective PET Units 1 - 6

UNIT - 2 **P-6**

FUNCTIONS: Defining; Describing People, Places, Things and Process.

SKILL FOCUS:

Reading – Inferences from sentences and short messages, True or False

Writing – Rewording, Sentence transformation, Convincing

Listening – Understanding the short messages and conversations

Speaking – Role-plays, Short conversations

Vocabulary / Grammar – Use of Adjectives/Adverbs, Comparatives and Superlatives

PRACTICE: Objective PET Units 7 – 12

UNIT - 3 **P-6**

FUNCTIONS: Describing Spatial and Temporal Relations, Giving Directions/Instructions

SKILL FOCUS:

Reading – Reading between the lines, Inferences, True/False

Writing – Developing hints, Writing short messages/paragraphs

Listening – Searching for factual information, Gap filling

Speaking – Snap Talks, JAM, Elocution

Vocabulary / Grammar – Prepositions, Phrasal Verbs, PET word list

PRACTICE: Objective PET Units 13 - 18

UNIT - 4 **P-6**

FUNCTIONS: Narrating, Predicting, Negotiating, Planning

SKILL FOCUS:

Reading – Reading for evaluation and appreciation, Comprehension

Writing – Letters, e-mails, 7 C's

ACTIVITIES:

- *SWOT Analysis.*
- *Snap talks.*
- *Spell Bee.*
- *Short conversations.*
- *Role play.*
- *Quiz.*
- *Elocution.*
- *JAM.*
- *Group. Discussion Debate.*
- *Team presentations.*

Listing – Following long conversations / Interviews

Speaking – Discussions, Debate, Descriptions

Vocabulary / Grammar – Modals, Conditionals, Verb forms (Time and Tense)

PRACTICE: Objective PET Units 19 – 24

UNIT - 5 **P-6**

FUNCTIONS: Requesting, Denying, Suggesting, Persuading

SKILL FOCUS:

Reading – Understanding factual information

Writing – Short Stories, Explanatory Paragraphs

Listening – Inferences from long speeches/conversations

Speaking – Announcements, Presentations

Vocabulary / Grammar - Punctuation, Cloze tests

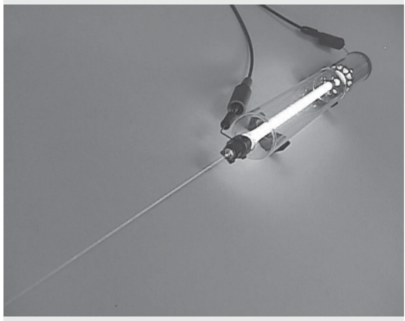
PRACTICE: Objective PET Units 25 – 30

TEXT BOOK:

1. Louise Hashemi and Barbara Thomas, “Objective PET”, Student’s Book with Answers, 2^{nd} edition, Cambridge University Press, 2015.

REFERENCE BOOKS :

1. Cambridge Preliminary English Test Without Answers 8.
2. Annette Capel and Rosemary Nixon, “Introduction to PET”, Oxford University Press.



16HS110 ENGINEERING PHYSICS LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	45

Course objectives and Description:

This lab is intended to make the students realize the theoretical concepts of physics having hands on experience in conducting the experiments.The students have to perform at least ten from the list of experiments.

Course Outcomes:

The student will be able to:

- realize the concept of resonance by conducting the experiments of AC sonometer and Melde's experiment.
- acquire the knowledge on magnetic field theory and thermal conductivity by conducting experiments, field along the axis of a circular coil and thermal conductivity of bad conductor
- understand the concepts of light by conducting the experiments of determination of wave length, numerical aperture of an optical fibre and also from V–I characteristics of Solar cell and LED.

LIST OF EXPERIMENTS

1. Determination of Velocity of ultrasonic waves in liquids.
2. Melde's Experiment - Transverse and Longitudinal modes.
3. Determination of wave length – Helium - Neon laser.
4. Determination of Planck's constant.
5. Determination of Frequency of Alternating current.
6. Field along the axis of a circular coil – Stewart and Gee's apparatus.
7. Band gap of semiconductor.
8. Determination of Hall coefficient.
9. Thermal conductivity of bad conductor - Lee's method.
10. Optical Fibre – Determination of numerical aperture.
11. Solar Cell – Efficiency.
12. Study of V – I characteristics of LED.
13. Seebeck effect - Determination of Seebeck coefficient of a thermo couple.

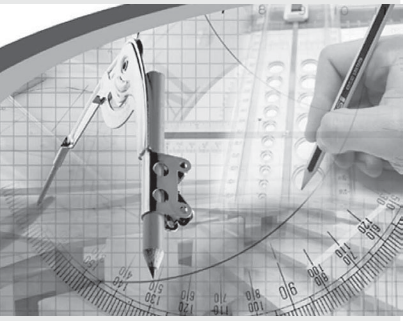
2. Engineering Physics laboratory Manual – Department of Physics, VFSTR University, 2016.



16HS108 ENGINEERING MATHEMATICS – II

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

It is aimed to offer different methods for finding rank of a matrix, solving linear equations using matrices, to compute Eigen values and Eigen vectors, to verify C.H.T and apply it to find power of a matrix. Also, to make the students familiarize with double and triple integrals, to make the student acquainted with the concepts of vector differentiation and integration. To make the student to use different mathematical tools of MATLAB related to above concepts.

Course Outcomes:

The student will be able to:

- carry out the basic operations of matrix algebra.
- use row operations to reduce a matrix to echelon form, normal form.
- determine consistency of a system linear equations.
- compute eigen values and eigen vectors.
- evaluate double integrals and triple integrals.
- evaluate double integrals in polar coordinates.
- utilize Cartesian and polar coordinates to find area.
- understand the concept of gradient, divergance and curl.
- apply vector integral theorems in finding surface and volume integrals.

SKILLS:

- ✓ *Appreciate various methods to find the rank of a matrix.*
- ✓ *Solve given system of linear equations.*
- ✓ *Compute Eigen values and Eigen vectors of a matrix.*
- ✓ *Compute the power of a matrix by suitable method.*
- ✓ *Evaluate Multiple integrals.*
- ✓ *Evaluate surface and volume integrals through vector integral theorems.*

UNIT - 1 **L-9, T-3**

RANK OF MATRIX AND LINEAR EQUATIONS: Rank of a matrix, Normal form, Triangular form, Echelon from, Consistency of system of linear equations, Gauss-Jordan method, Gauss elimination method, Gauss-Siedal method.

UNIT - 2 **L-9, T-3**

EIGEN VALUES AND EIGEN VECTORS: Eigen values, Eigen vectors, Properties (without proofs), Cayley-Hamilton theorem (without proof), Power of a matrix, Diagonalisation of a matrix.

UNIT - 3 **L-9, T-3**

MULTIPLE INTEGRALS: Double integrals, Evaluation, Evaluation in polar coordinates, Change of order of integration, Change of variables, Applications to area in cartesian coordinates and polar coordinates, Triple integrals, Fundamentals, Evaluation of triple integrals.

UNIT - 4 **L-9, T-3**

VECTOR DIFFERENTIATION: Vector function, Differentiation, Scalar and vector point function, Gradient, Normal, Divergence, Directional derivative, Curl, Vector identities.

UNIT - 5 **L-9, T-3**

VECTOR INTEGRATION: Line integral, Surface integral, Volume integral, Green's theorem, Stoke's theorem, Gauss theorem of divesergence (without proofs).

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours-30

1. Matrix Algebra.
2. Rank of a matrix.
3. System of equations (Direct method).
4. System of equations (Cramer's Rule).
5. System of equations (matrix inversion method).
6. Eigen values and Eigen vectors of a matrix.
7. Powers of matrix & Cayley-Hamilton Theorem.
8. Vector algebra.
9. Gradient.
10. Divergence.
11. Curl.
12. Multiple Integrals (Area etc).
13. Interpolation.

TEXT BOOKS:

1. H. K. Dass and Er. Rajanish Verma, "Higher Engineering Mathematics", 3rd edition, S. Chand & Co., 2014.
2. B. S. Grewal, "Higher Engineering Mathematics", Khanna Publishers, 44th edition, 2014.
3. Rudra Pratap, "Getting started with Matlab", Oxford University Press, 2009.

REFERENCE BOOKS:

4. Erwin Kreyszig, "Advanced Engineering Mathematics", 8th edition, John Wiley & Sons (Asia) Pvt. Ltd., 2001.

ACTIVITIES:

- *Differentiate the methods to find the rank of a matrix.*
- *Solve given system of linear equations and compare with MATLAB output.*
- *Compute Eigen values and Eigen vectors of a matrix and compare with MATLAB output.*
- *Compute the power of a matrix by suitable method.*
- *Evaluate multiple integrals and compare with MATLAB output.*
- *Evaluate surface and volume integrals through vector integral theorems.*

16HS107 ENGINEERING CHEMISTRY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	-	10	-	-

Course Description and Objectives:

This course aims to develop fundamental knowledge on new engineering materials and their significance in science and engineering applications. In addition, characterization of materials using basic and advanced experimental techniques is also offered. Besides, analysis of water sample and treatment method for domestic, commercial and industrial applications are also covered.

Course Outcomes:

The student will be able to:

- understand the limitations of using hard water for domestic and industrial purposes.
- choose and apply suitable methods to soften the hard water for industrial and domestic applications.
- understand electrochemistry and its importance for applications such as fuel cells, modern lithium ion batteries etc.
- understand the types of corrosion and their implications followed by their control and prevention methods.
- familiarize the preparation, properties and applications of various polymers.

SKILLS:

✓ *Analyse the total hardness of water sample.*

✓ *Understand the basic principles involved in various batteries.*

✓ *Understand the mechanisms of corrosion and various controlling methods.*

✓ *Synthesize various polymers.*

✓ *Identify the functional groups present in chemical compounds using Infrared and Ultraviolet instruments.*

UNIT - 1 **L-9**

WATER TECHNOLOGY: Introduction, WHO, BIS standards of water, Hardness of water, Determination of hardness by EDTA (Numerical Problems), Disadvantages of hard water, Scales and sludges, Caustic embrittlement, Boiler corrosion, Priming and foaming, Softening methods - Zeolite process, Ion Exchange process; Desalination of brackish water - Reverse osmosis, Electrodialysis.

UNIT - 2 **L-9**

ELECTRO CHEMISTRY: Electrode potential, Electrochemical series, Nernst equation, Reference electrodes, Calomel and standard hydrogen electrode, Ion selective electrode, Glass electrode, Determination of pH using glass electrode; Primary cell, Secondary cell - Lead-acid storage cell, Lithium ion battery; Fuel cells - Hydrogen oxygen, Methanol oxygen.

UNIT - 3 **L-9**

SCIENCE OF CORROSION: Introduction, Dry corrosion, Wet corrosion, Mechanisms of wet corrosion, Bimetallic corrosion, Concentration cell corrosion, Factors influencing the rate of corrosion; Corrosion control methods - Cathodic protection, Electroplating, Electrolessplating, Corrosion inhibitors.

UNIT - 4 **L-9**

POLYMERS: Introduction, Types of polymerization - Preparation, Properties and applications of polyethylene, PVC, Teflon, Bakelite, Urea formaldehyde, Silicones; Rubber, Vulcanization, Synthetic rubbers - Buna-S, Buna-N, Neoprene; Introduction to conducting polymers; Poly thiophene.

UNIT - 5 **L-9**

INSTRUMENTAL TECHNIQUES: Interaction of radiation with matter, UV-Visible spectroscopy - Beer, Lambert's law, Qualitative and quantitative analysis, Block diagram of UV-Visible spectrophotometer, IR spectroscopy - Types of vibrations, Block diagram of IR spectrophotometer.

TEXT BOOKS:

1. P. C. Jain and Monica Jain, "Engineering Chemistry", 17th edition, Dhanpat Rai Publications, 2010.
2. Shashi Chavala, "A Text book of Engineering Chemistry Engineering Materials and Applications", 3rd edition, Dhanpat Rai Publications, 2015.

REFERENCE BOOKS:

1. K. S. Maheswaramma and Mridula chugh, "Engineering Chemistry", 1st edition, Pearson publication, 2015.
2. M. R. Senapati, "Advanced Engineering Chemistry", 2nd edition, Lakshmi Publications, 2006.
3. H. W. Wilard and Demerit, "Instrumental methods of Analysis", 7th edition, CBS Publications,1986.
4. Gurudeep Raj and Chatwal Anand, "Instrumental Methods of Analysis", 5th edition, Himalaya Publications, 2007.

ACTIVITIES:

- *Collect water samples from different villages near VFSTR University and determine the total hardness, and total alkalinity.*
- *Present the water analysis report to the villagers and suggest proper measures to be taken.*
- *Measure the rate of corrosion of iron objects by weight loss method.*
- *Identify some of the functional groups like carboxylicacid, aldehyde and ketones by I.R. Spectroscopy.*
- *Collect water sample from different villages and estimate the fluoride present in the raw water and suggest some steps for the removal of fluoride.*

16ME101 ENGINEERING GRAPHICS

Hours Per Week :

L	T	P	C
1	-	3	3

Total Hours :

L	T	P
15		45

WA/RA	SSH/HSH	CS	SA	S	BS
6	15	-	5	-	-

Course Description and Objectives:

The main aim of this course is to familiarize the students with the conventional concepts of engineering drawing and computer aided applications in various fields. Engineering graphics is an "International language of Engineers". It is the most effective method of communicating technical ideas in a 2D and 3D format.

Course Outcomes:

The student will be able to:

- sketch engineering objects in the freehand mode.
- create geometric construction with hand tools.
- create dimensions of objects.
- prepare plan and elevation of any pictorial view.
- draw freehand lettering.
- make isometric sketches using graphics.
- draw orthographic multi-view sketches using graphics.

SKILLS:

- ✓ *Draw free hand sketches, layouts, circuit diagrams, plan and elevations.*
- ✓ *Draw geometrical objects like polygons, solids of different types.*
- ✓ *Visualize the objects in real time situations.*
- ✓ *Develop 3D views (isometric views).*

UNIT - 1 **L-3, P-10**

INTRODUCTION TO ENGINEERING DRAWING: Types of lines, Lettering, Dimensioning, Construction of polygon and conics (Ellipse, Parabola and Hyperbola by general method), Ellipse by oblong method.

UNIT - 2 **L-3, P-8**

ORTHOGRAPHIC PROJECTIONS: Principle of projection, Planes of projections, Projections of points, Projection of straight lines, Inclined to one plane and both the planes, Projections of planes, Simple planes, Planes inclined to one reference planes.

UNIT - 3 **L-3, P-8**

PROJECTIONS OF SOLIDS: Projections of prisms, Pyramids, Cylinders, Cones, Solid axis inclined to one plane.

UNIT - 4 **L-3, P-10**

AUTOCAD: Introduction to AutoCAD

ISOMETRIC VIEWS: Isometric drawing of simple objects, Isometric view of prisms, Pyramids, Cone and cylinder, Simple orthographic views into isometric views through AutoCAD.

UNIT - 5 **L-3, P-9**

ORTHOGRAPHIC VIEWS: Conversion of pictorial views into orthographic views through AutoCAD.

TEXT BOOKS:

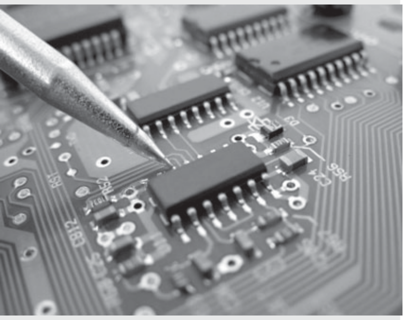
1. N.D.Bhatt, "Engineering Drawing", 53rd edition, Charotar Publication, 2014.
2. Basant Agrawal , C.M.Agrawal "Engineering Drawing" , 2nd edition., Tata McGraw Hill,2014.

REFERENCE BOOKS:

1. J. hole, "Engineering Drawing", 2nd edition, Tata McGraw Hill, 2008.
2. K.L. Narayana, "Engineering drawing", 2nd edition, Scitech Publications, 2008.

ACTIVITIES:

- *Draw line diagram of different machineries.*
- *Draw plan and elevations of buildings and engineering products.*
- *Understand, visualize 3-D components/ products and develop drawings.*
- *Draw different curves used in several engineering applications such as bridges, dams etc.*



16EE102 BASICS OF ELECTRICAL AND ELECTRONICS ENGINEERING

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	5

Course Description and Objectives:

This course provides an in-sight into the functioning of basic electrical components like resistor, inductor and capacitor. It deals with the constructional and operational details of both D.C & A.C machines. It also deals with the basic electronic components like P-N Junction Diode, Zener diode, Transistor and their characteristics.

Course Outcomes:

The student will be able to:

- understand the notation and usage of components in electric circuits.
- analyze AC (single and three phase) and DC, AC circuits using different methods and laws.
- operate various electrical machines.
- understand the concepts of semiconductor devices and their operation.

SKILLS:

✓ *Distinguish between linear and nonlinear elements by looking at VI characteristics.*

✓ *Develop a simple loop generator.*

✓ *Design a voltage regulator using Zener diode.*

✓ *Design a half wave rectifier using PN junction diode.*

✓ *Design a full wave rectifier using PN junction diodes.*

UNIT - 1 **L-9**

FUNDAMENTALS OF DC CIRCUITS: Circuit concepts, Concepts of network, Active and passive elements, Voltage and current sources, Concept of linearity and linear network, Unilateral and bilateral elements, R, L and C as linear elements, Ohm's Law, Kirchhoff's Laws - Application to simple series, Parallel circuits, Mesh and nodal analysis of simple resistive circuits (Simple numerical problems).

UNIT - 2 **L-9**

FUNDAMENTALS OF A.C. CIRCUITS: Generation of A.C. voltage - Frequency, Average value, R.M.S. value, Form factor, Peak factor for sinusoidal only, Phasor representation of alternating quantities, Analysis of simple series and parallel A.C. circuits (simple numerical problems).

BALANCED THREE PHASE SYSTEMS: Relation between phase and line quantities of voltages and currents in star and delta connected systems (Elementary treatment only).

UNIT - 3 **L-9**

FUNDAMENTALS OF ELECTROMAGNETISM: Concepts of Magneto motive force, Reluctance, Flux and flux density, Concept of self Inductance and mutual Inductance, Coefficient of coupling (only elementary treatment and Simple numerical problems).

TRANSFORMERS: Principle of operation of single phase transformer, Constructional features, EMF equation (simple numerical problems).

UNIT - 4 **L-9**

DC MACHINES: Constructional details of a D.C. Machine, D.C. Generator, Principle of operation, EMF equation, Types of D.C. generators (simple numerical problems), D.C. Motor, Principle of operation, Torque equation, Types of D.C. motors (simple numerical problems).

A.C MACHINES: Principle of operation of three phase induction motors, Slip ring and squirrel cage motors, Torque equation, Constructional details of synchronous machine.

UNIT - 5 **L-9**

SEMICONDUCTOR DEVICES: Classification of solids based on energy band theory, Intrinsic and Extrinsic semiconductors, P-type and N-type semiconductors, P-N junction diode and its characteristics, Half and Full wave rectifiers, Zener diode and its characteristics, Voltage regulator, Bi polar junction transistor, Operation, Types, Applications.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- apply the ohm's law, KVL and KCL laws to different circuits.
- calculate the power and energy in electric circuits.
- operate and find the transformation ratio of transformer at different loads.
- study and verify the characteristics of semiconductor devices.
- calculate the efficiency of both HWR and FWR.

LIST OF EXPERIMENTS Total hours-30

ACTIVITIES:

- *Decoding the value of resistors.*
- *Design and fabricate a simple loop permanent magnet generator.*
- *Design and fabricate a simple air cored transformer.*
- *Fabricate full and half wave rectifiers using PN junction diodes.*
- *Fabricate a voltage regulator using Zener diode.*

1. Verification of Ohm's law.
2. Verification of Kirchhoff's current law.
3. Verification of Kirchhoff's voltage law.
4. Measurement of Energy in single phase resistive load circuit.
5. Measurement of Power in single phase resistive load circuit.
6. Transformation ratio of a single phase transformer at different loads.
7. Verification of PN junction diode characteristics under both forward and reverse bias.
8. Verification of Zener diode characteristics under both forward and reverse bias.
9. Implementation of Half Wave Rectifier without filter.
10. Implementation of Full Wave Rectifier without filter.

16HS111 ENGINEERING CHEMISTRY LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	45

Course description and Objectives:

This course is aimed at enlightening the importance of theoretical concepts of chemistry and experimental techniques for characterization of materials.

Course Outcomes:

The student will be able to:

- analyse the total hardness present in water samples.
- determine the total alkalinity of water used in industries.
- acquire the knowledge on polymers used as insulators.
- familiarize advanced techniques in chemical analysis using conductometer and pH meter.

LIST OF EXPERIMENTS

1. Determination of Total Alkalinity of water.
2. Estimation of Total hardness of water.
3. Find the percentage of available chlorine in Bleaching powder.
4. Estimation of Fe (II) by Dichrometry method.
5. Preparation of Phenol - Formaldehyde Resin.
6. Synthesis of Urea- Formaldehyde Resin.
7. Estimation of Concentration of acid by pH metry.
8. Determination of Strength of acid by Conductometry.
9. Measurement of Mn^{+7} by Colorimetry.
10. Determination of concentration of a salt by ion exchange method.
11. Find the concentration of Mn^{+7} and Cr^{+6} by UV-Visible Spectrophotometry.
12. Find the rate of corrosion by weight loss method.

TEXT BOOKS:

1. J.Mendham, R.C.Denney, J.D. Bares, M.Thomas and B.Siva Sankar, “Vogel’s Text book of qualitative Chemical Analysis”, Pearson Publications - Volume I, 2009.

16HS109 ENVIRONMENTAL SCIENCE AND TECHNOLOGY

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P
30	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	20	4	-	4	-

Course Description and Objectives:

Environmental Science and Technology offers technological aspects of environmental science and in maintaining environmental integrity in relation to human development. It helps every engineer to plan appropriate strategies for addressing environmental issues and also contribute to the development of innovative technologies for solving such issues. It produces professionals who will ensure sustainable development of the nation in general and environmental in particular.

Course Outcomes:

The student will be able to:

- observe and integrate the diverse information from sources outside the classroom.
- think critically, creatively, resourcefully and strategically, including identifying steps needed to reach goals, manage projects, evaluate progress, and adapt approaches, developing both self reliance, and civic mindedness.
- adapt eco-friendly technologies in order to maintain hygienic conditions.
- understand the human activities that are detrimental to environment.
- collaborate across diverse disciplines to identify and create solutions that conserve and help maintain biodiversity in the long term.
- discuss the issues involved in the generation of renewable energy resources.

SKILLS:

- ✓ *Understand structural relationships, abstract models, symbolic languages and deductive reasoning.*
- ✓ *Gain perspectives to adrress the challenges, improvise and devise solutions.*
- ✓ *Identify solutions to environment and development issues, using planning, analysis, modeling, and new approaches.*
- ✓ *Acquire fieldwork techniques to study, observe and prepare documents, charts, PPTs, Models etc.*
- ✓ *Understand how natural resources should be used judiciously, to protect biodiversity and maintain ecosystem.*

UNIT - 1 **L-6**

NATURAL RESOURCES: Environmental studies - Definition scope and its importance, Need for public awareness; Natural resources - Forest resources, Deforestation, Water resources, Properties and conflicts, Mineral resources, Extraction and impacts, Food resources, Modern agriculture methods, Fertilizer pesticide problems, Water logging, Salinity, Energy resources, Renewable and non-renewable energy resources, Harness technology, Solar energy technologies, Land resources, Land degradation, Soil erosion; Role of an individual in conservation of natural resources.

UNIT - 2 **L-6**

ECOSYSTEMS AND BIODIVERSITY: Ecosystem - Concept, Structure and functions of an ecosystem, Food chains, Food webs, Ecological pyramids, Energy flow, Energy regulation, Succession, Biogeochemical cycles, Aquatic ecosystems; Biodiversity - Introduction, Bio-geographical classification, Values of biodiversity, Biodiversity at global, National and local levels, Hot-spots of biodiversity, Threats to biodiversity, Endangered and endemic species of India, Conservation of biodiversity.

UNIT - 3 **L-6**

WASTE MANAGEMENT AND GREEN TECHNOLOGY: Solid waste management - Causes, Effects and control measures of municipal and Industrial wastes; Pollution - Air, Water, Thermal, Soil and noise pollutions, Role of an individual in prevention of pollution; Remote sensing / GIS - Introduction, definitions, Applications of the remote sensing; Innovative practices - Objectives, Innovative practices in agriculture and forest community, Bio-villages; Green technology for sustainable development; Life cycle assessment and its concept.

UNIT - 4 **L-6**

SOCIAL ISSUES AND EIA: Sustainable development, Water conservation, Cloud seeding, Rainwater harvesting methods watershed management, Global warming, Acid rain, Ozone layer depletion, Environmental legislation - Wildlife protection act, Water act, Forest conservation act, Air act, Environmental protection act; Environmental Impact Asssssment (EIA) - Introduction, Definition of E.I.A and E.I.S, Scope and objectives, Importance of E.I.A in proposed projects / industry / developmental activity.

UNIT - 5 **L-6**

ENVIRONMENTAL SANITATION: Food sanitation - Food and drugs Act, Food preservations, Milk sanitation, Tests for milk, Pasteurization of the milk; Water, Air, Soil and food borne diseases, Maintenance of sanitary and hygienic conditions; Role of youth in the development, Promoting activities, Youth as initiators, Field work/environmental visit - Visit to a local area to document environmental assets river/ forest/ grassland / hill /mountain, Study of local environment, Common plants, Insects, Birds; Study of simple ecosystems - Pond, River, Hill slopes etc., Visit to industries/water treatment plants/effluent treatment plants.

TEXT BOOKS:

1. Anubha Kaushik and CP Kaushik, “Perspectives in Environmental Studies”, 5th edition, 2016
2. Benny Joseph, “Environmental studies”, 2nd edition, McGraw Hill Education, 2015.

REFERENCE BOOKS:

ACTIVITIES:

- *Painting contests on environmental issues and themes.*
- *Models of energy resources, Pollution and Solid Waste Management-3R strategy.*
- *Quiz competition.*
- *Essay writing competition.*
- *Skit, JAM and debate.*
- *Field work and documentation.*
- *Assignments.*

16TF101 TEXTILE FIBERS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5		45	-	-	-

Course Description and Objectives:

This course provides an essential knowledge to study properties and applications of textile fibers. The objective of the course is to introduce stem and leaf fibres such as jute, hemp, flax, banana. It also includes the basic concept of fibre structure and principles of man-made fiber spinning.

Course Outcomes:

The student will be able to:

- define basic terminologies related to textiles.
- classify the textile fibers into different groups.
- understand the process of extraction of the natural fibers.
- understand the principles of spinning of man-made fibers.

SKILLS:

- ✓ *Examine the suitability of any fiber for textile applications.*
- ✓ *Identify a given natural textile fibers.*
- ✓ *Identify a given man made textile fibers.*
- ✓ *Find the application of given fiber based on its properties.*
- ✓ *Identify monomer required and type of polymerization for the given manmade fiber.*

UNIT - 1 **L-8**

INTRODUCTION TO TEXTILES : Textile elements defined Textile fibre, staple fibre, filament; yarn: spun, continuous filament, monofilament and multifilament, flat and textured yarn; single, ply and cabled yarns; thread; fabric: woven, knitted and non-woven with their classifications.

UNIT - 2 **L-8**

FLOW CHART FOR TEXTILE MANUFACTURING PROCESSES FROM FIBRE TO FABRIC : Detailed Classification of textile fibers – Distinction between Natural and Man Made Fibers , Properties expected of an ideal textile fibre: Essential and desirable properties

COTTON: Morphology, Physical & Chemical properties. A Brief note on Latest type of Cottons: Organic & Bt..

UNIT - 3 **L-9**

WOOL: Morphology, Physical and Chemical Properties –Brief study on frictional properties of wool, heat of wetting.

SILK : Types of Silk, Grianage Centers, Introduction to rearing of silk, cocoon, stifling (Methods), Storage, Sorting, cooking, brushing, reeling, degumming and weighting

JUTE AND FLAX : Retting methods, Structure and Properties, applications.

UNIT - 4 **L-10**

BASIC CONCEPTS OF FIBRE STRUCTURE : Definition of orientation, properties and schematic representations of highly, moderately and poorly-oriented fibres, examples of such fibres; definition of crystallinity, schematic representation of

fibre with crystalline and amorphous contents, outline of influence of crystallinity on fibre properties; crystallinity values of some common natural and man-made fibres Principles of fibre forming polymers–glass transition temperature Melting temperature.

PRINCIPLES OF SPINNING : Principles of wet-spinning, dry spinning and melt-spinning of man-made fibres, typical examples of fibres so spun, principle of drawing and its importance, outline of POY and FOY made fibres.

UNIT - 5 **L-10**

REGENERATED FIBRES : Polymer source, spinning method, physical and chemical properties and uses of natural-polymer fibres: Viscose rayon, modal, lyocell, acetate and bamboo fibre

SYNTHETIC FIBRES : Names of raw materials and spinning technique/s used, name of polymer, physical and chemical properties and uses of synthetic fibres: nylon 6, polyester, acrylic and polypropylene.

ACTIVITIES:

- *Choose a fibre and its blend for a shirting, suiting,upholstery and for various such applications.*
- *Identification of types of fiber in blended yarn like in p/c blend.*
- *Design of fabric for apparel use using flex and other stem fiber.*
- *Milling and felting of wool.*
- *Degumming and reeling of silk from silk cocoon.*

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Microscopic test of fibers.
2. Burning test of fibers.
3. Chemical test of fibers.
4. Feel test of fibers.
5. Determination of fibres in blended yarn.
6. Classification of specific manmade fiber out of different manmade fibers.
7. Classification of specific natural fiber out of different natural fibers.
8. Determination of specific cellulosic fiber out of different cellulosic fibers.
9. Determination of specific protein fiber out of different protein e fibers.
10. Identification of fiber using UV spectrophotometer.

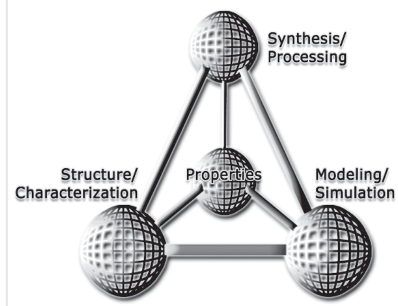
TEXT BOOKS:

1. J. Gordon Cook, "Hand Book of Textile Fibers", Vol 1 & 2, 5th Edition, Wood Head Publishers, London, 2005.
2. Gohl, Vilensky, "Textile Science", 2nd Edition, Mahajan Book Publishers, Ahemedabad, 2003.

REFERENCE BOOKS:

1. S. P. Mishra, "Fibre Science and Technology", New Age International Publishers, New Delhi, 2000.
2. Tammanna & N. Sonwalkar, "Handbook of Silk Technology", Wiley Easterrn Limited, New Delhi, 2002.
3. A. A. Vaidya, "Production of Synthetic Fibers", Prentice Hall of India, New Delhi, 2005.

16CH102 MATERIALS SCIENCE AND TECHNOLOGY



Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
8		60	-	10	-

Course Description and Objectives:

This course will emphasize the structure-property relationships of engineering materials. The objective of this course is to provide knowledge in basic principles of material science and also to study structure of materials at all length scales.

Course Outcomes:

The student will be able to:

- understand crystal structure of various materials and techniques used for structure determination.
- understand the influence of defects on the properties of materials
- understand the fundamentals of equilibrium phase diagrams.
- gain knowledge on various fabrication techniques used for manufacturing common engineering materials.

SKILLS:

- ✓ *Identify the type of material: ceramic, polymer, metal or composite.*
- ✓ *Select materials with suitable properties for a given application.*
- ✓ *Predict the type of fracture/failure in a material.*
- ✓ *Read and draw conclusion from binary phase diagrams.*
- ✓ *Suggest manufacturing methods for metals, ceramics and polymeric materials.*
- ✓ *Determine basic mechanical properties of materials using universal testing machine.*

ACTIVITIES:

- *Testing the type of failures.*
- *"Gee Whiz": Wonder presentations.*
- *Analysis of load test results.*
- *Study of micro structures of materials.*
- *Segregation of the given materials.*
- *Identification of phases in the given phase diagram.*

UNIT - 1 **L-9**

BONDING IN SOLIDS: Inter atomic forces and potential energy, Types of bonds: primary and secondary, Variation in bonding character and resulting properties

CRYSTAL STRUCTURE : Classification of crystal systems – SC, BCC, FCC & HCP crystal structures with examples, Atomic packing factor, coordination number, determination of miller indices of planes & directions of cubic and hexagonal crystals, linear and planar densities, separation between successive planes, Crystal structure determination: Bragg law, powder method.

UNIT - 2 **L-10**

CRYSTAL DEFECTS: Point defects, Dislocations: edge, screw and mixed, burgers vectors, energy of dislocation, motion of dislocation, dislocation density. Grain boundary, stacking faults and twin boundary.

PHASE DIAGRAMS: Gibb's phase rule & terms involved – Reduced phase rule, tie line and lever rules, Two component systems–invariant reactions – Eutectic system & Iron-Carbon system.

UNIT - 3 **L-9**

MATERIALS FABRICATION TECHNIQUES: Fabrication of Metals: forming operations, casting, Fabrication of Ceramics: particulate forming processes, cementation. Forming techniques of Plastics: compression, transfer and injection molding, extrusion, blow molding.

MECHANICAL PROPERTIES: Stress-strain relations of various solids – Elastic, Anelastic, Visco-elastic and plastic deformations in solids, creep and fatigue, fracture: Brittle and Ductile, fracture toughness, ductile to brittle transitions.

UNIT - 4 **L-8**

ELECTRICAL & SEMICONDUCTING PROPERTIES: Ohm's Law, Electrical Conductivity, Electronic and Ionic Conduction, Energy Band Structures in Solids, Classification of solids based on band models, Electron Mobility, Electrical Resistivity of Metals, Intrinsic Semiconduction, Extrinsic Semiconduction, The temperature dependence of Carrier Concentration, Factors That Affect Carrier Mobility.

UNIT - 5 **L-8**

DIELECTRIC AND MAGNETIC PROPERTIES: Dielectric behavior: capacitance, polarization, frequency dependence of dielectric constant, dielectric strength. Types of magnetism, Ferromagnetism-Domain theory-hystersis behavior, ferrimagnetism, soft and hard magnets – application of magnetic materials.

16HS202 PROBABILITY AND STATISTICS

Hours Per Week :

L	T	P	C
4	-	-	4

Total Hours :

L	T	P
60	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	35	4	10	2	-

Course Description and Objectives:

This course deals with descriptive statistics, correlation and regression and their applications, probability, theoritical distributions and testing of hypothesis.

The objective of this course is to enable the student to understand and apply statistical techniques, curve fitting, correlation and regression, probability and also to make the student familiar with discrete, continuous distributions and testing of hypothesis.

Course Outcomes:

The student will be able to:

- distinguish between quantitative and categorical data and represent the data in graphical and tabular forms.
- calculate and interpret measures for the centre and spread of a data set.
- decide how and when to use the normal model.
- calculate and interpret correlation coefficient and regression lines.
- understand the rules of probability and apply them.
- compute probabilities using theoritical distributions.
- test hypothesis for population parameters.

UNIT - 1 **L-9**

STATISTICS: Basic Definitions, Frequencies, Graphical Representation, Histogram, Ogive curves, Measures of Central tendency, Arithmetic mean, Median, Mode, mean deviation, standard deviation, Symmetry and Skewness, Karl Pearson's Coefficient of skewness.

UNIT - 2 **L-9**

CURVE FITTING, CORRELATION & REGRESSION : Least squares method, curve fitting (straight line and parabola only). Covariance, Correlation, Types, Pearson's Coefficient of correlation, Rank correlation, Spearman's rank correlation. Regression, Regression lines.

UNIT - 3 **L-8**

PROBABILITY : Introduction, Definition (Classical and Axiomatic approach), Addition theorem, Conditional probability, Multiplication theorem, Total probability, Bayes theorem.

UNIT - 4 **L-8**

DISTRIBUTIONS: Random variables, Discrete and Continuous variables, Introduction to Distributions.

BINOMIAL DISTRIBUTION : Definition, Mean and Standard deviation, Recurrence relation, Applications, Fitting of binomial distribution.

POISSON DISTRIBUTION : Definition, Mean and Standard deviation, Recurrence relation, Poisson Distribution is an approximation of Binomial distribution, Applications, Fitting of Poisson distribution.

NORMAL DISTRIBUTION : Definition, Normal curve, Mean and Standard deviation, Median, Mode, Normal Distribution applications.

UNIT - 5 **L-12**

SAMPLING METHODS : Population and Sampling, Parameters and Statistics, Types of sampling. Test of hypothesis and test of significance: Null hypothesis, Errors, Level of significance, Confidence Limits, Testing large samples, Sample distribution of proportion, T-distribution for small sample, difference between means of small sample, Chi square test for goodness of fit, Chi square test for test of independence.

16EL102 SOFT SKILLS LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	15	-	-	-	-	-	-

Course Description and Objectives:

The Soft Skills Laboratory course is aimed at training undergraduate students on employability skills. Designed to impart work related skills, the course will enable trainees to develop interpersonal communication, leadership, Preparing Resume, Group Discussion, and Interview Skills. It will give them the required competence and confidence to handle professional tasks.

Course Outcomes:

The Student will be able to:

- formulate mathematical models of physical systems and represent them in block diagrams and signal flow graphs equip with requisite professional and inter-personal skills.
- they will possess the ability to think critically on issues for informed decision making and know how to communicate effectively through choice of appropriate language and speech, while dealing with others at the workplace.
- through identification and introspection on individual strengths and weaknesses.
- students will emerge with improved levels of self-awareness and self-worth, for greater efficacy at workplace.

SKILLS:

✓ *Communicate and understand the difference between soft skills and hard skills,*

✓ *Learn professionalism and Employability skills.*

✓ *Plan Career by drawing their SWOT, Setting the Goal, learn the importance of Time and Stress Management.*

✓ *Learn Vocabulary, Situational English, Group Discussion, Reading Comprehension and Listening Comprehension which are essential for all competitive examinations.*

✓ *Prepare Resume and learn how to face interview.*

✓ *Learn Gender sensitive language, Good manners, emotional intelligence and essential skills.*

ACTIVITIES:

- *Formal and informal communication…*
- *SWOT analysis,*
- *Stephen covey Time Management matrix*
- *Stress Management techniques*
- *Vocabulary flash cards*
- *Situational Dialogues*
- *Group Discussion*
- *Resume preparation*
- *Mock Interview.*
- *Reading comprehension activities*
- *Listening comprehension Activity by watching the American accent video*
- *Emotional intelligence, etiquette quiz*

UNIT - 1 **L-4. P-4**

A) COMMUNICATION:

Need for effective communication - the process of communication, levels of communication, flow of communication, choice of diction and style with reference to setting (formal, semi-formal or informal); communication networks, barriers to communication, miscommunication, noise and ways to overcome the barriers.

B) SOFT SKILLS:

Difference between soft and hard skills, need for soft skills, professionalism, employability skills

C) CAREER PLANNING:

Job vs. career, Goal setting, SWOT analysis, planning and prioritization, four quadrant time management system, self-management, stress-management.

ACTIVITY: Johari Window for SWOT analysis; Setting a SMART goal using the provided grid; Writing a Statement of Purpose (SOP).

UNIT - 2 **L-4. P-4**

A) VOCABULARY BUILDING:

Word etymology, roots, prefixes & suffixes, synonyms & antonyms, collocations, one-word substitutes, analogies, idioms and phrases, contextual guessing of unfamiliar words, task-oriented learning (50 words).

ACTIVITY: Making a flash card (one per day by each student) – vocabulary exercises with hand-outs – Vocabulary quiz (evaluation will be a combination of the 50 words provided by the instructor and the flash cards made by the student (one per day)

B) FUNCTIONAL ENGLISH:

Situational dialogues, Role plays (including small talk), Self introduction, Opening and closing a telephonic conversation, Making an appointment, Making a query, Offering/Passing on information, Communicating with superiors, Expressing agreement/objection, Opening bank account (combination of prepared and impromptu situations given to each student)

C) GROUP DISCUSSION:

Articulation and flow of oral presentation, dynamics of group discussion, intervention, summarizing and conclusion, voice modulation, content generation, Key Word Approach (KWA), Social, Political, Economic, Legal and Technical Approach (SPELT), View Point of Affected Part (VAP), language relevance, fluency and coherence.

ACTIVITY: Viewing a recorded video of GD & Mock sessions on different types of GD topics-controversial, knowledge, case study (including topics on current affairs)

UNIT - 3 **L-4. P-4**

A) RESUME-WRITING:

Structure and presentation, defining career objective, projecting one's strengths and skill-sets, summarizing, formats and styles and covering letter.

ACTIVITY: Appraising some samples of good and bad resumes, preparing the resume, writing an effective covering letter.

B) FACING INTERVIEWS:

Interview process, understanding employer expectations, pre-interview planning, opening strategies, impressive self-introduction, answering strategies, other critical aspects such as body language,

grooming, other types of interviews such as stress-based interviews, tele- interviews, video interviews, frequently asked questions (FAQs) including Behavioural and HR questions and the aspect looked at by corporate during interviews

ACTIVITY: Writing responses and practicing through role plays and mock interviews on the FAQs including feedback.

UNIT - 4 **L-4. P-4**

A) READING COMPREHENSION:

Reading as a skill, techniques for speed reading, understanding the tone, skimming and scanning, appreciating stylistics, impediments for speed reading, eye fixation, sub-vocalization, critical reading, reading based on purpose, reading for information, reading for inference.

ACTIVITY: Reading comprehension exercises with texts drawn from diverse subject areas. (Hand-outs). Newspaper activity with students divided into 4 groups. Each group looks at critical component of communication such as Listening, Speaking, Reading and Writing enabling them to be better communicators as well as be more aware about the current affairs, which help in Group Discussion.

B) LISTENING COMPREHENSION:

Listening as a skill, different types of listening, active and passive listening, top-down approach, bottom-up approach, understanding the non verbal cues of communication; intonation and stress.

ACTIVITY: Narration of a story, Speech excerpts with different accents (Indian, British, American), listening comprehension exercises with audio and video excerpts.

UNIT - 5 **L-4. P-4**

IMPACT OF LANGUAGE ON PERSONALITY:

Gender sensitive language in MNCs, cultural sensitivity, social awareness, emotional intelligence, good manners, self-grooming, positive body language, accepting and handling responsibility, assertiveness, problem solving, negotiating skills, networking and creating a good first impression.

Seven essential skills for a team player; attentive listening, intelligent questioning, gently persuading, respecting other’s views, assisting others, sharing, participating actively.

ACTIVITY: Johari Window, Games and Case studies.

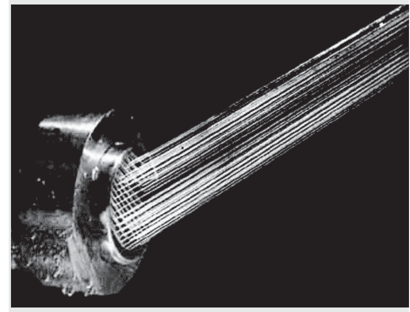
16TF201 TECHNOLOGY OF MANUFACTURED FIBRES



Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	20	-	-	-	-

Course Description and Objectives:

This course offeres the knowledge of different principles of forming man made fibers. It also includes the concepts of micro fibers and texturising of man made fibers. Objective of this course is to enable the student to understand the concepts of manufacturing man made fibers, thier properties and applications.

Course Outcomes:

The student will be able to:

- find the structure property relation of synthetic fibres.
- understand the importance of synthetic fibres in textile industry.
- know the various types of spinning principles.
- understand the texturizing and its importance.
- describe about the various developments in man made fibers.

SKILLS:

✓ *Differentiate and identify various man made fibers.*

✓ *Analyze the structure of different fibers by using x-ray pattern.*

✓ *Analyze the texturisation of man made fibers.*

ACTIVITIES:

- *Collect different types of man made fibers.*
- *Find the different applications in which man made fibers are widely used.*
- *Analyze the fibers structure through SEM, optical microscope, FTIR.*
- *Selection of different routes for manufacturing of man made fibers.*

UNIT - 1 **L-10**

INTRODUCTION TO FIBER STRUCTURE : Micellar theory, Continuous theory, Fringed micelles theory, Fringed fibrils theory, Modified fringed micellar theory; Important operations in the production of synthetic fibres, Principles of fibre forming polymers, Parameters influencing the quality; Degree of order, Degree of localization of order, Length/ width ratio of localized units, Degree of orientation, Degree of polymerization; Methods of investigating fibers - X-Ray diffraction, IR, NMR, Thermal Analysis, Optical microscopy, Electron microscopy, Scanning Electron microscopy.

UNIT - 2 **L-8**

MELT SPINNING : Detailed note on elements of melt spin equipment, Polyester manufacture - Trans esterification, Polycondensation, Side reactions, Properties and Applications; Polyamides - Manufacture of Nylon 6, nylon 66, (manufacture monomers various routes for PET and nylon); Surface modification of polyester cause and effect, Recent developments in polyesters like CDP, EDP, CFDP, APP; Spin finishes - Ideal spin finish, Properties, Application and removal, Constitution of spin finish.

UNIT - 3 **L-8**

SOLUTION SPINNING : Introduction, Process variables for solution spinning, Dry spinning, Wet spinning, Salient features of solution spinning, Rheology of Wet & Dry Spinning, Development of fiber structure and morphology during solution spinning, Comparison, Brief note on dry jet wet spinning; Manufacture of Rayons - Viscose, Acetate and Cuprammonium – Physical and chemical properties, A brief note on recent developments in viscose manufacturing (Lyocell fibre).

UNIT - 4 **L-9**

MANUFACTURING : Properties and applications of of Acrylics, Mode acrylics, PVA, Poly Vinyl Chloride and Polyvinyl alchohol, Polypropylene fibres; Drawing - Condition, Phenomena of necking, Drawing behavior of thermoplastic polymer, Influence of drawing on structure and property; Micro fibres - Detailed study of production, Properties and applications of micro fibres, Problems in processing of micro fibres in weaving.

UNIT - 5 **L-10**

TEXTURISING : Draw backs of flat filament yarns, Definition and concept of texturising, Classification and characteristics of textured yarns, False Twist Texturising - Scientific principle in twist texturising, Methods of production of stretched(single heater) by conventional methods, Draw Texturising concept, Air Jet Texturising and its principle; Brief introduction about Other methods of texturising - BCF Processes and Yarns, Edge crimping, Stuffer box crimping, Knit-de-knit, Gear Crimping, Chemical Texturising.

TEXT BOOKS:

1. V. B. Gupta, “Technology of Manufactured Fibres”, 3rd edition, Chapmen and Hall, New York, 2004.
2. A. A. Vaidya, “Production of Synthetic Fibers”, Prentice Hall of India, New Delhi, 2005.

REFERENCE BOOKS:

1. S. P. Mishra, “Fibre Science and Technology”, New Age International Publishers, New Delhi, 2000.
2. H.V.Srinivasmurthy, “Textile Fibers”, Textile Association of India Publication, 1988.

16TF202 YARN MANUFACTURING

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	10	20	-	-	-	10

Course Description and Objectives:

This course deals with the concepts, production calculations, different types of available machines and various developments in yarn manufacturing process. This course is aimed to impart fundamental knowledge required to understand yarn manufactuing process.

Course Outcomes:

The student will be able to:

- select the different fiber properties required for spinning different counts.
- understand different types of yarn manufacturing machines and their principles.
- calculate production capacities of carding, comber and ring frame.

SKILLS:

✓ *Optimize the factors affecting yarn properties.*

✓ *Identify the various key factors in yarn manufacturing process.*

✓ *Set the parameters for the production of cotton, synthetic and blended yarns.*

✓ *Differentiate the carded, combed and core cover yarns.*

ACTIVITIES:

- *Collect technical specifications of yarn preparatory machines.*
- *Prepare spin plan for carded and combed yarns for a given count.*
- *Prepare flow chart for carded and combed yarn manufacturing process.*
- *Observe spinning parameters by visiting a spinning mill.*

UNIT - 1 **L-10**

GINNING AND BLOW ROOM : Ginning Objectives, pre and post ginning equipments and working principles of Gins, Factors affecting ginning performance, brief note on Pressing and baling of cotton. Need for Mixing and Blending, objectives, Fibres commonly blended (Different types of Blends) Introduction to Opening and Cleaning: Working principle of a typical blow room, Accessories in blow room.

UNIT - 2 **L-9**

CARDING AND DRAW FRAME : Chute feeding, Introduction to Carding - Objectives, Zones, Role of each element, Card settings, High production cards, Latest Developments in carding; Draw Frame - Objects, basic concepts of drawing, Principle of Roller drafting, Different drafting systems, Methods of roller weighing, Coiler mechanism, Study of Modern Draw frame, Auto levelling in carding & Draw frame (open loop and closed loop) Production calculations.

UNIT - 3 **L-8**

COMBER : Introduction to combing, Hooks theory, Combing preparatory requirements, passage of material through comber, Functions and setting of each part, Combing principle, cycle of combing Back ward and Forward combing, Working of modern combers, Production calculations, Combing efficiency.

UNIT - 4 **L-9**

SPEED FRAME : Objects, Need of speed frame, Detailed study of mechanisms (Drafting, Twisting and bobbin building) of speed frame, Constructional details, Driving arrangement, Calculation of draft, Twist & production, Recent Developments.

UNIT - 5 **L-9**

RING FRAME : Objects, Passage of material, Functions of parts, Specifications of R/F, Drafting, Twisting & winding, Brief study of spindles, Ring & travellers, Calculation of draft, Twist & production. Ring data/ ISM(Individual spindle Monitoring), Post spinning operations, Ring doubler, Two for one twister, Brief note on reeling.

TEXT BOOKS:

1. W. Klein, “Series of Short Staple Spinning”, Wood head publishers, 2005.
2. T. K. Pattabhiraman, “Essential Facts of Practical Cotton Spinning”, Mahajan Publisher, Ahmedabad, 2005.

REFERENCE BOOKS:

1. Venkatsubramani, “Spun Yam Technology, Vol-III”, SSM Institute Publications. Komarapalyam, 2003.
2. T.V.Ananthan, “Tablets on Combing, Speed Frame, Ring Frame”, TAI Publications, 2003.
3. A. R. Khare. “Elements of Combing”, Mahajan Book Publishers, Ahmedabad, 2003.

16TF203 FABRIC MANUFACTURING

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	20	-	-	5	10

Course Description and Objectives:

This course offers the basics of fabric manufacturing and their preparatory processes includes winding, warping, sizing and post sizing operations. The objective of this course is to make students familiar with the process of fabric manufacturing.

Course Outcomes:

The student will be able to:

- distinguish the needs of weaving preparatory processes such as winding, warping, sizing and post sizing operations.
- explain the formation of continuous length of fabric in shuttle looms.
- understand the basic concepts in shuttle-less weaving machines.

SKILLS:

- ✓ *Distinguish the weaving preparatory machines.*
- ✓ *Prepare size reciepe for given yarn.*
- ✓ *Optimize weaving process parameters.*
- ✓ *Identify yarn faults in yarn before and after winding.*
- ✓ *Distinguish sized and un-sized yarns.*
- ✓ *Selection of looms based on end product.*

ACTIVITIES:

- *Observing weaving parameters by vising weaving mill.*
- *Collection of technical specifications of winding, warping, sizing machines.*
- *Drawing and denting of warp in hand loom.*
- *Comparison of shuttle-less looms technical specifications.*
- *Preparation of peg plan for given design.*

UNIT - 1 **L-8**

WINDING & WARPING : Introduction to Fabric Manufacture - Need for Weaving preparatory process. Drum and precision Winding, Essentials features of drum winders, Tensioner, Yarn clearers, Splicing, Common package faults, Production calculations.

Warping - Classification, Working of beam and sectional warping machine, Calculations for production, Features of modern warping machines.

UNIT - 2 **L-9**

YARN SIZING - Objects, Types of sizing, Sizing materials, Size reciepes for different yarns, Size paste preparation, Multi-cylinder Sizing Machine, Different zones, Construction of Sow box, Concept of drying - Wet splitting, Brief note on Beam winding, Types of combs, Sizing faults and remedies; Calculations in sizing, Post sizing operations.

UNIT - 3 **L-9**

SHUTTLE WEAVING : Introduction to weaving, Classification of loom motions, Shedding, Picking - Cone under pick, Over pick; Beat-up mechanism, 7 wheel Take-up, Negative and positive Let-off, Auxillary motions - Warp stop motions, Temples, Weft stop motion; Introduction to dobby and jacquard shedding, Loom production calculations.

UNIT - 4 **L-10**

PROJECTILE & RAPIER WEAVING : Limitations of ordinary looms, Classification of shuttle-less weaving machines. Projectile picking motion , picking phases, Torsion rod details, Receiving unit , Selvedge weaves, Sley drive, Multi color weft insertion.

Principle of rapier weft insertion through various mechanisms such as single rapier, Double rapier, rigid and flexible, Rapier heads, Rapier drive, Selvedge formation, Field of application & commercial viability.

UNIT - 5 **L-9**

JET & NARROW WEAVING : Air Jet weft Insertion, Stages of weft insertion, Main nozzles designs, Relay nozzle designs, Quality of Air, Water Jet Weft Insertion - Picking mechanism, Weft insertion elements, Loom settings, Influence of yarn characteristics, Features of water jet looms, Comparison with air jet. Introduction to Multiphase Weaving, Fabric defects & remedies; Introduction to narrow fabric weaving.

TEXT BOOKS:

1. A.T.C Marks, Robinson, “Principles of Weaving”, The Textile Institute, 2011.
2. M. K. Talukdar, D. B. Ajgonkar, “Weaving Machines, Materials & Methods”, Textile Institute, 1998.

REFERENCE BOOKS:

1. S.C Adanur, “Handbook of Weaving”, CRC publications, 2008.
2. A. Ormerod, “Modern Preparation & Weaving Machines”, BWE Publications, 1983.
3. K. T. Aswani, “Plain Weaving Motions”, M/S Mahajan book publishers, Ahmedabad, Gujarat, 2007.

16TF204 FASHION, ART, DESIGN AND ACCESSORIES

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	10	-	10	5	5

Course Description and Objectives:

This course offers introduction to fashion, art and design, consists of basic definition of fashion, classification and its type, types of design, elements of designing, traditional textiles of India and role of garment accessories. The objective of this course is to provide insights into fashion designing and technology.

Course Outcomes:

The student will be able to:

- define and discuss fashion, art and design related terms.
- understand the classification and types of fashion.
- describe different types of traditional textiles of India.
- explain the aesthetic and functional purpose of commonly used garment accessories.
- discuss key factors in the design of typical leather and ornamental fashion accessories.

SKILLS:

✓ *Trace origin of any clothing and costume.*

✓ *Identify the nature of fashion for the leading fashion brands.*

✓ *Give the styling techniques and material requirement for the traditional costume.*

✓ *Identify the different textile techniques of traditional India.*

✓ *Select material for garment accessories based on aesthetic and functional requirements.*

✓ *Select material for leather accessories based on aesthetic and functional requirements.*

ACTIVITIES:

- *Making of mood board for particular theme.*
- *Selection of design and color from mood board.*
- *Design of clothing based on mood board.*
- *Accessories designing using ribbons, braids, laces, appliqués, buttons, zippers, snap fasteners etc.*
- *Showcase of ornamental accessories as per specific theme.*

UNIT - 1 **L-10**

INTRODUCTION TO FASHION, ART AND DESIGN : Definition of fashion, art, design, Costume and clothing, Origin and history ; Importance of clothing, Factors to be considered in the selection of clothing; Evolution of dress from paintings, Cuttings, Sculpture and wood carvings.

Classification and Types of Fashion - Factors effecting fashion, Business of fashion, Theories of fashion; Study of leading fashion designers – French, Italian, American, Indian and English.

UNIT - 2 **L-9**

DEFINITION OF FASHION DESIGNING : Concepts of design, Types of design, Elements of design, Principle of designing, Role of fashion designers.

COSTUMES OF ANCIENT CIVILIZATIONS: History of Indian costumes – Mughal and post-Mughal periods; Traditional costumes of different states of India; Costumes of ancient civilizations - Egypt, Greek, Roman, English, French empires during Renaissance 1500 –1600 AD; Overview of costumes of Pakistan, Sri Lanka, Burma, China, Japan and Africa.

UNIT - 3 **L-9**

TRADITIONAL TEXTILES OF INDIA : History of embroidered, hand-woven, dyed, printed and painted textiles of India; Floor coverings: Carpets and durries; Colored textiles – Bandhani, Patola, Ikkat, Pocchampalli; Woven textiles Brocades, Jamavar, Paithani, Jamdani, Chanderi, Maheshwari, Kanjivaram, Kota, Baluchari, Dacca Muslin, Himrus and Amrus; Printed textiles – Chintz, Sanganeri; Painted textiles – Kalamkari; Shawls of Kashmir.

UNIT - 4 **L-8**

GARMENT ACCESSORIES : Introduction to fashion accessories – classification of various accessories; Selection of materials, Design, Functional and aesthetic performance and their advantages; Ribbons, Braids, Laces, Appliqués, Buttons, Zippers, Snap fasteners, Hooks and eyes, Hook and loop tape; Eyelets, Neck tie, Scarves, Stoles, Umbrella, Socks, Stockings, Veils.

UNIT - 5 **L-9**

LEATHER ACCESSORIES : Selection of materials, Design, Functional and aesthetic performance and their advantages; Various styles of footwear, Belts, Gloves, Hand bags, Hats, Wallets, and other personal leather goods; Concepts of patternmaking techniques and the production process of these accessories.

ORNAMENTAL ACCESSORIES : Selection of materials, Design, Functional and aesthetic performance and their advantages; The various styles: Pendants, Waist bands, Wrist bands, Necklaces, Head bands, Bows, Sunglass, Wrist watches, Rings, Ear rings, Bangles, Bracelets and anklets.

TEXT BOOKS:

1. G.Russel, B.Nicholas, “Traditional Indian Textiles”, Thames and Hudson, London, 1991.
2. J. Peacock, “Fashion Accessories – The Complete 20th Century Source Book”, Thames and Hudson Publication, 2000.

REFERENCE BOOKS:

1. G.S Churye, “Indian Costume”, Prakashan Pvt. Ltd., Bombay, 1995.
2. R. Bhargav, “Design Ideas and Accessories” Jain Publications Pvt. Ltd., 2005.
3. P. Tortora, “Encyclopedia of Fashion Accessories”, Om Books Publication, 2003.
4. Elaine Stone, “Fashion Merchandising – An Introduction”, 5th edition, McGraw-Hill, 1990.

16TF205 PATTERN ENGINEERING

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	10	-	20	-	-

Course Description & Objectives:

This course offers concepts of pattern making for a specific garment. It starts with workroom practices that form the basis for garment cutting, making of basic body slopers with dart manipulation, sleeves and collars. The objective of this course is to impart the knowledge and skill of converting designs, sketching into a product.

Course outcomes:

The student will be able to:

- understand various pattern making tools in the workroom.
- perform the drafting of basic body slopers and dart manipulation.
- understand the pattern drafting for sleeves, collars, yokes and cuffs.
- use these basic the principles and styles of grading for men's and women's garments.

SKILLS:

✓ *Selection of measurements for a given design.*

✓ *Design the bodice blocks for skirt, torso and sleeves.*

✓ *The dart manipulation for the particular fit.*

✓ *Draft standard size block patterns for men, women.*

✓ *Grading of shirt, trousers, jacket, waistcoat.*

ACTIVITIES:

- *Taking measurements using flat pattern methods.*
- *Design darts using slash and spread, pivotal methods for apparel.*
- *Pattern making for plain, puff and bell types of sleeves.*
- *Pattern making for peter pan, cape roller and sailor collars.*
- *Grading of basic bodice.*

UNIT - 1 **L-10**

WORKROOM PRACTICES : Patternmaking tools, Pattern paper, Workroom terms and definitions, Industrial form and pattern production terms; Figure Analysis - Head theory, Seven and a half and eight; Measuring Techniques - Introduction, Measurement charts, Tools required for measuring process, Measuring the form, Pin marking the armhole, Circumference measurement, Horizontal balance line (HBL), Strap measurement, Vertical measurements, Horizontal measurements, Standard measurement chart; Flat pattern methods - Bespoke method and industrial method.

UNIT - 2 **L-8**

MAKING BASIC BODY SLOPERS (PAPER PATTERNS) : Bodice blocks, Skirt blocks, Torso blocks and sleeves; Dart Manipulation - Slash and spread, Pivotal methods, Designing with darts, Tuck darts, Pleats, Flares, Gathers and style lines.

SLEEVES: SET–IN–SLEEVES : Plain, Puff, Bell, Bishop, Circular and leg-o-mutton; Sleeves combined with bodice, Kimono, Dolman and Raglan.

UNIT - 3 **L-9**

COLLARS: Peter pan, Partial roll, Cape collar, Scalloped, Sailor, Square, Full roll convertible, Shawl and Shakespeare collars.

CUFF: Shirt cuff, Self-faced cuff, French cuff and contoured cuff.

UNIT - 4 **L-9**

YOKES : Preparing patterns for yokes - Partial, Yoke without fullness, Yoke with fullness and yoke supporting or releasing fullness.

GARMENT DRAFTS : Basic principles and methodologies used to draft standard size block patterns for men, Women, Namely for shirts, Trousers, Skirts, Blouses, Nightwear, Jackets and special dresses, etc.

UNIT - 5 **L-9**

PRINCIPLES OF GRADING : Master and basic grades - Basic back, Basic front, Basic sleeve, Basic collar, Basic cuff and basic facing; Styles of Grading - Men's size chart, Grading of shirt, Trousers, jacket, Waistcoat, Displacement of bust dart to side seam, Armhole and neck, Women's size chart, Multi-track grading.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Preparation of patterns for making of

1. Baba suit
2. Baby frock
3. Round Neck T- Shirt
4. Romper
5. Salwar and Kameez
6. Blouse
7. Skirt and Top
8. Brassier and Panties
9. Nighty
10. Men's Shorts
11. Men's Formal Shirts
12. Men's Formal Trousers
13. Jeans

TEXT BOOKS:

1. J Helen Armstrong, "Pattern Making for Fashion Designers" 4th edition, Prentice-Hall, New Jersey, 2006
2. C Schaeffer, "The Complete Book of Sewing Shortcuts", Sterling Publishing (NY), 1981.

REFERENCE BOOK:

16TF206 FASHION ILLUSTRATION LAB

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	20	10	-	-

Course Objectives:

The objective of this course is to develop among the students the basic creative and manipulative skills necessary for fashion design through various shading techniques.

Course Outcomes:

The student will be able to:

- sketch the various elements and principles of designing.
- examine the human body structure (anthropametry) to design clothing.
- draw fashion figures and visually communicate apparel design details.
- demonstrate an understanding of the colour theory using various colour schemes.
- illustrate different styles of garment components and reproduce them to fit on to fashion figures.

LIST OF EXPERIMENTS Total hours: 30

Illustration of the following:

1. Lines and strokes using pencil shading techniques; lettering and numbering styles.
2. Elements of design.
3. Principles of design.
4. Different postures of human head, hand, leg and feet.
5. Different hair styles.
6. Sketching of lay figure using head theory.
7. Preparation of Prang's colour wheel.
8. Preparation of different colour schemes.
9. Rendering different fabric textures.
10. Sleeves, cuffs, and necklines.
11. Skirts, pockets, trousers, and skirt tops

16TF207 ACCESSORIES DESIGN AND SURFACE ORNMENTATION LAB

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	30	-	10	10	10	-	5

Course Objectives:

The objective of this course is to Illustrate and construct different styles of various fashion accessories using different materials.

Course Outcomes:

The student will be able to:

- demonstrate the basic embroidery stitches
- explain and embellish the fabric surface using decorative embroidery works, applique work and patch work.
- learn the basics of paint brush strokes and color mixing techniques and demonstrate fabric painting through various techniques.

LIST OF EXPERIMENTS Total hours: 30

1. Designing and production of Earrings, bracelets, necklaces using materials like colored papers, buttons, fabric scraps, coloured beads and stones.
2. Designing and Construction of handbags, purses and gloves.
3. Designing and Construction of headband, bows, cap and waistband
4. Basic Embroidery stitches:

   Running, satin, long and short, chain, stem, herringbone, cross stitch, knotted stitch, fishbone, wheat, couching, buttonhole
5. Special embroidery stitches:

   Bead work, sequin work, zardosi, aari work, badla worK.
6. Decorative surface embellishment:

   Cutwork, drawn thread work, eyelet and mirror work, shadow work, ribbon work and Kundan work.
7. Appliqué work and Patch work.
8. Fabric Painting:

   Colour theory, mixing techniques, basic paint brush strokes
9. Fabric Painting:

   Stencil painting, spray fabric paint, sponges and stamp painting
10. Tie and Dye and Batik Work.
11. Illustration of skirts, pockets, trousers, and skirt tops.

16EL103 PROFESSIONAL COMMUNICATION LABORATORY

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	42	6	12	3	2

Course Description and Objectives:

The Professional Communication Laboratory course is aimed at improving professional communication skills (LSRW – Listening, Speaking, Reading and Writing) of undergraduate students and preparing them for their profession as engineers and managers. This course will help students to understand professional communication and personality as two interlinked spheres of influence, and provide them with exposure to conventions of corporate communication involved in the functioning of the business world.

Course Outcomes:

Students will be able to:

- having gone through the course, students would be equipped to clear industry recognized certification such as BEC Vantage by the University of Cambridge.
- this will equip them to stand out both in the professional setting as well as for further pursuits in the academic world.
- Since this certification looks at LSRW (Listening, Speaking, Reading and Writing) components in great detail, we hope to equip students to confidently and successfully attempt all the 4 critical components.

SKILLS:

- ✓ *Understand and use grammar rules in writing; sentences, paragraphs, paraphrasing,*
- ✓ *Write business emails, memos, letters, reports and proposals*
- ✓ *Comprehend business articles, and documents*
- ✓ *Expressions in Professional context, and acquire presentation skills like one minute talk and pair discussion in professional context*
- ✓ *Familiarize and comprehend British accent by listening to recorded speeches and discussions.*

UNIT - 1 **L-3, P-3**

BUSINESS ENGLISH VOCABULARY: Glossary of most commonly used words (formal and informal usage) **Elements of Technical Writing**: Sentence structure, reducing verbosity, arranging ideas logically, building coherence, paragraph level and document level, topic sentence, cohesive devices, transitional words, paraphrasing and précis-writing. **Mechanics of Writing:** Stylistic elements, the rapporteur, the purpose, the reader's viewpoint (audience), elementary rules of grammar, choice of diction, elementary principles of composition, matters of form, punctuation, conventions of business communication, language and professional tone, weak links in business correspondence, ethical concerns in business writing, code of conduct (not sending illegal, offensive, disparaging personal remarks or comments) in written business communication

UNIT - 2 **L-5, P-5**

BUSINESS CORRESPONDENCE: E-mail: nature and scope, e-mail etiquette, clear call for action, common errors in composing e-mails, office communication such as meeting agenda and minutes of the meeting, notice, circular and memo

Letter-Writing: Formal and informal letters, structure of formal letters, expressions of salutations, different types of letters [such as sales letter, complaint letter, response to the complaint letter (dispute resolution), letter of permission, letter of enquiring, claim letter – letter of apology etc], introductory and concluding paragraphs and clear call for action.

PROFESSIONAL PROPOSAL/REPORT: Differentiating proposals and reports, Drafting formal business proposals, types of reports such as factual reports, feasibility reports and survey reports, parts ofa report (such as title page, declaration, acknowledgements, table of contents, abstract, introduction, findings, conclusion and recommendations, citations, references and appendices)

UNIT - 3 **L-2, P-6**

SPEAKING: Speaking in business context, assertiveness, politeness, making requests, queries and questions, negotiations, asking for information, offering suggestions, conflict resolution, contacting clients, initiating, addressing delegates (in public), features of a good power point presentation (making the PPT), delivering the presentation effectively, telephone etiquettes, delivering seminar/proposal/ report effectively, team meeting etiquettes (face to face and conference call), making effective one minute presentations

UNIT - 4 **L-4, P-10**

READING: Reading and comprehending business documents, learning business register, regularizing the habit of reading business news, suitable vocabulary, skimming and scanning text for effective and speedy reading and dealing with ideas from different sectors of corporate world in different business contexts.

UNIT - 5 **L-2, P-5**

LISTENING: Specific information in business context, listening to telephonic conversations/messages and understanding the correct intended meaning, understanding the questions asked in interviews or in professional settings, summarizing speaker's opinion or suggestion, enable active listening

TEXT BOOKS: BEC

1. Guy Brook Hart (2014): Cambridge English Business Bench Mark: Upper Intermediate, Second Edition: CUP.
2. CUP (2002) Cambridge: BEC VANTAGE: Practice Tests, CUP

ONLINE REFERENCE BOOKS:

1. http://www.cambridgeenglish.org/exams/business-certificates/business vantage/preparation/
2. https://www.youtube.com/watch?v=qxFtn9pGaTI.

ACTIVITIES:

- *Basic grammar practice, Framing paragraphs on topics allocated,*
- *Paraphrasing an article or a video in your own words Finding topic sentences in newspaper articles*
- *Finding out new words from a professional viewpoint Understanding the meaning and its usage*
- *Perusing samples of well prepared proposals and reports*
- *Draft different proposals/ reports on topics assigned.*
- *Watching videos/listening to audios of business presentations*
- *Classroom activities of team and individual presentations*
- *Using PPTs, mock exercises for BEC speaking.*
- *Presenting (speaking) the written components completed in Unit-I.*

16TF208 GARMENT CONSTRUCTION TECHNIQUES

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	10	10	10	-	-

Course Description and Objectives:

This course offers the knowledge required for constructing garments by learning various types of seams, stitches and sewing threads, method of construction of different types of sleeves and collars. The objective of this course is to provide basic knowledge and skill required for construction of garment.

Course Outcomes:

The student will be able to:

- differntiate various types of seams, seam finishes, stitches and sewing threads.
- learn techniques involved in the construction of garment closures.
- perform the construction of garment yokes, fullness and hem etc.

SKILLS:

✓ *Design the stitching methods used for pockets, plackets, waist bands and cuffs.*

✓ *Construct pockets, yokes and collars for a given garment.*

✓ *Select the right accessories for construction of garment.*

✓ *Stitch different types of plackets to acceptable quality levels.*

UNIT - 1 **L-9**

SEAM AND STITCHES : Seams - Definition, Types of seams, Seam quality, Seam performance, Factors to be considered in the selection of seam, Seam finishes, Seam defects; Stitches - Definition, Stitch classes, Stitch parameters, Factors to be considered in the selection of stitches, Stitching defects.

UNIT - 2 **L-9**

SEWING THREAD, SLEEVES AND COLLARS : Sewing thread - Types, Construction, Sewing thread quality, Selection of sewing thread; Types of fabrics - plaid and napped fabrics.

Sleeves and collars - Types of sleeves, plain, puffs, gathered, bell, bishop, circular, leg-o-mutton, Magyar sleeves dolman, kimono; Collars – Classification, full, flat, roll, partial roll, puritan collar, sailor collar, square collar, rippled collar, scalloped collar, mandarin, convertible, tie, shawl reverse and notch collar.

UNIT - 3 **L-10**

YOKES AND FULLNESS : Yokes - Definition, Selection of yoke design, Different styles of yoke, Simple yoke, yokes with or without fullness, midriff yokes, Methods of attaching yokes.

Fullness - Definition types; Darts - single, double, pointed darts, tucks, pin tucks, cross tucks, piped tucks, shell tucks, Pleats - knife pleats, box pleats, invertible box pleats, kick pleats, flare, godets, gathers, shirrings, single or double frills, ruffles; Hemming Techniques - Definition, Factors to be considered in the selection of hems, Types of machine stitched hem, Hand stitched hem; Neckline Finishes - Preparation and uses of True Bias, Facings, and Binding.

UNIT - 4 **L-9**

POCKETS AND PLACKETS : Plackets -Types, two piece plackets, continuous plackets, kurtha plackets, shirt cuff placket.

Pockets - Types, patch pocket, patch with lining / flap, front hip, set-in seam, slash pocket with flap-single lip, double lip. Waistband: one-piece, two-piece and tailor waistband, elastic applied; Cuffs - Types, square shape, round shape.

UNIT - 5 **L-8**

FASTENERS : Introduction and construction techniques of garment closures; Applications of zippers, Types of button and button holes and their applications, Types and applications of hooks and eye snaps; Velcro, Eyelets, Cords.

ACTIVITIES:

- *Draw and construct the yoke, collar and pockets.*
- *Prepare Various stitches used for making the garment.*
- *Collect sewing threads used for various garments.*

LABORATOTY EXPERIMENTS

Course Outcomes:

The student will be able to

- Construct different types of seams, seam finishes, darts, tucks and pleats to acceptable quality levels.
- Construct different neckline finishes such as bias binding, facing and collars to acceptable quality levels.
- Stitch various types of pockets to acceptable quality levels.
- Construct different types of sleeves to acceptable quality levels.

LIST OF EXPERIMENTS Total hours: 30

Preparing samples of

1. basic seams, seam finishes.
2. darts, tucks and pleats.
3. plackets - continuous bound placket, 2 piece placket.
4. plackets - fly opening and zipper.
5. necklines - bias facing, bias binding and shaped facing.
6. collars - peter pan collar, shirt collar.
7. collars - shawl collar, sailor collar.
8. pockets - patch, bound and front hip pocket.
9. sleeves - plain, raglan kimono.
10. sleeves - puff, bell sleeve.

TEXT BOOK:

1. C. B. Shaeffer, “The Complete Book of Sewing Shortcuts”, Sterling Publishing Company, 1981.

REFERENCE BOOKS:

1. C. Gerry, “Garment Technology for Fashion Designers”, Blackwell Science Ltd., 1997.
2. Laing, J Webster, “Stitches and Seams”, Woodhead Publishing Ltd., 1998.

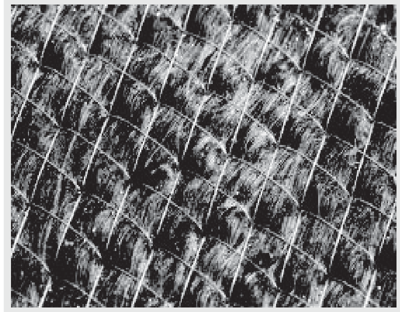
16TF209 TECHNOLOGY OF KNITS AND NON-WOVENS



Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	20	-	-	10	-

Course Description and Objectives:

This course provides an overview on knitting elements followed by warp knitting and weft knitting. Then it introduces manufacturing techniques of different types of nonwoven fabrics. It also includes the application of different types of knitted and nonwoven fabrics. This course is aimed at offering basic concepts required for manufacturing knitted and nonwoven fabrics.

Course Outcomes:

The student will be able to:

- understand the role of knitting machine elements in fabric manufacturing.
- differentiate between pain, rib and interlock types of basic knitted structure.
- understand the role of cam setting and hence the patterning in weft knitting.
- describe loop formation and lapping movements fro warp knitting.
- compare the different techniques of fiber web manufacturing.
- know the bonding of fibre web using different techniques.

SKILLS:

- ✓ *Identify different types of knitted structures and their applications.*
- ✓ *Selection of different types of nonwoven fabrics for specific applications.*
- ✓ *Prepare binder for chemical bonding applications.*
- ✓ *Select needle type and its specifications for needle punched fabric as per application.*
- ✓ *Analyse type of fibre suitable for thermal bonding.*

ACTIVITIES:

- *Identification of face, back side and type of knitted fabric by visual observation.*
- *Analysis of SMS non woven composite fabric for surgical mask.*
- *Identification and analysis of nonwoven fabric used in carry bags.*
- *Designing of needle punched fabric for filtration application.*
- *Selection of knitting machine gauge based on tightness factor.*

UNIT - 1 **L-9**

INTRODUCTION TO KNITTING : Comparison of woven, nonwoven and knitted fabrics, Fundamental terms of knitting technology, Elements of knitting machine, Various zones in knitting machine and their significance. Classification of weft knitting structures and machines,

WEFT KNIT STRUCTURES: Plain or single jersey, rib, interlock and purl, loop and needle diagrams to illustrate basic structures.

A brief note on straight bar and flat knitting machines.

UNIT - 2 **L-9**

PATTERNING IN WEFT KNITTING: Scope and need, Arrangements in cam for knit, miss stitch and tuck stitch, Requirements for hosiery yarn-a brief note on common defects, A brief note on straight bar and flat knitting machines knitting dynamics: A brief note on forces acting on the needle, linear and nonlinear cams, needle breakages.

INTRODUCTION TO WARP KNITTING: elements, a brief note on driving arrangements for guide-bars, needle bars and sinker bars, basic lapping movements in warp knitting, Loop formation in Tricot and Raschel knitting machines.

UNIT - 3 **L-9**

Classification and definition of Nonwoven, Nonwoven manufacturing techniques, Dry laid webs – fibre selection, fibre preparation, web formation, layering,

WET LAID NONWOVEN: Raw materials and fibre preparation, common defects, production process, hydro-former, cylinder mould machine, Roti-former, Special features and applications,

AIR LAID NONWOVEN: Raw materials, production process, Rando-webber, Cicopee web formation method, Applications.

POLYMER-LAID WEB FORMATION: Basic production process of spun-laid technique. Melt blown nonwovens - Melt blown fabric production –Characteristics and properties of melt blown Fabric.

UNIT - 4 **L-9**

MECHANICAL BONDED WEBS: Introduction to needle punching – Passage of material through needle loom – Feeding system, Batt formation, Drafting, Pre-needling and final needling;

compared specification of needle,Texturing needles- Application of needle punching.

STITCH BONDED NONWOVEN: stages of production –Maliwatt and Malivlies process-applications.

HYDRO ENTANGLED NONWOVENS: Principle, Specific energy coefficient– Hydro entanglement process technology: Pre-wetting, Support surface, Dewatering, Nozzles, Injector, Drying - Applications.

UNIT - 5 **L-9**

CHEMICAL BONDED NONWOVEN: Latex binder –Bonding technology – Saturation, Foam bonding, Spray bonding, Print bonding, Powder bonding, Application of chemical bonded nonwoven.

THERMAL BONDED NONWOVENS: Binder, Binding fibres, Binding powder, Binding webs, Methods of thermal bonding – Hot calendaring, Belt calendaring, Oven bonding, Ultrasonic bonding, Radiant heat bonding.

TEXT BOOKS:

1. S. J. Russel, "Handbook of Nonwovens", 1st edition, Wood Head Publishing in Textiles, 2006.
2. D. J. Spencer, "Knitting Technology", 2nd edition, Wood Head Publishing Company, England, 2008.

REFERENCE BOOKS:

1. Turbak, "Nonwoven Process Performance & Testing", 2nd edition, Tappi Press, Woodhead Publishing, Cambridge, 1993.

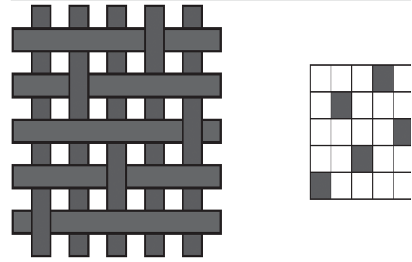
16TF210 FABRIC STRUCTURE AND DESIGN



(a) Flat view (b) Weave design

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	30	-	20	-	20	-	-

Course Description and Objectives:

This course introduces the significance of basic elements of fabric designing, basic weaves with their derivatives and applications. It also includes the concepts of designing of compound weave structures. Objective of this course is to offer basic concepts of representation and drawing of fabric weaves.

Course Outcomes:

The student will be able to:

- draw the design elements viz. drafting, lifting and reed plan for given weave.
- analyze basic design parameters of different fabrics.
- interpret the design elements for a given structure
- understand the manufacturing techniques for a different weave structure
- describe the color and weave effect.

SKILLS:

✓ *Draw the weave notation for given fabric structure.*

✓ *Selection and arrangement of number of heald frame as per drafting plan.*

✓ *Measure and calculate designing parameters viz. thread density, crimp, count.*

✓ *Identify the manufacturing requirements for a given weave structure.*

✓ *Draw the color pattern from warp and weft color plan.*

ACTIVITIES:

- *Analysis and designing of weaves, drafting and lifting plan for shirting fabric, upholstery.*
- *Analysis and designing of weaves, drafting and lifting plan for any compound structured fabric .*
- *Manufacturing of woven fabric from drafting and lifting plan.*
- *Drawing weave notation for any weft knitted fabric.*
- *Manufacturing of warp knitted fabric based on design.*
- *Draw-in and denting operation for basic weaves.*

UNIT - 1 **L-9**

INTRODUCTION TO FABRIC STRUCTURE : Method of weave notation – Elements of fabric structure: design, draft, denting and peg plan and their interrelation - Warp faced,weft faced, equifaced weaves, – Classification of weaves .

PLAIN WEAVE : Modification of plain: as warp rib, weft rib, matt, fancy matte, stitched hopsack, Sateen and satin: Characteristics, Possible moves, Modification of floating weaves.

UNIT - 2 **L-9**

INTRODUCTION TO TWILLS : Characteristics of Twills, Twill angle, Twist and twill interaction, Twill modification: wavy, herringbone, combined, broken, steep, flat, skip twills.

FANCY WEAVES : Honey comb-Huck-A-Back-Mockleno: Basic designs, Distorted thread effects (warp and weft way). Colour and weave effects: Effect produced by simple colour and weave combinations.

UNIT - 3 **L-9**

ADVANCED FABRICS : Extra thread figuring – Bed fords and welts or piques – Backed cloths: reversible and wadded backed cloths.

DOUBLE CLOTHES : Principles of stitching, reversible, wadded, inter changeable double cloths Treble cloths: principle of stitching.

WEFT PILES : Plushes & corduroys, A brief note on Warp plies, Velvets.

UNIT - 4 **L-8**

TERRY PILES : Terry motion, Terry ornamentation, Dobby striped & Check effects in Terry.

GAUZE & LENO : Principle, Sheds formed in Leno, Designs for simple leno.

KNIT STRUCTURE NOTATION : Knit stitch, Float stitch, Tuck stitch, Symbolic (graph paper) representation of stitches, Diagrammatic representation of stitches.

UNIT - 5 **L-10**

DERIVATIVES OF PLAIN KNIT : Le Coste, Cross tuck, Satin, Knitted twill, Ornamentation of rib structure 2X2 rib structure, Half cardigan, Full cardigan, Derivatives of inter lock structures; Ponte-di-Roma, Ottoman rib, Bourrelet, TEXI-pique, Milano rib, Swiss Pique.

REPRESENTATION OF WARP KNIT STRUCTURES : Point paper, Chain-link notation, Single fabrics: Chain stitch, Tricot lap, Extension of 1-and-1 lapping, Full tricot, Lock knit, Reverse lock knit, Satin, Loop raided fabrics, Queen’s cord, Sharkskin.

LABORATOTY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Identification of basic features of fabrics and Need for Analysis.
2. Analysis of different types of warp faced, weft faced and equifaced plain fabrics.
3. Analysis of different types of Twill fabrics.
4. Analysis of different types of Sateen fabrics.
5. Selection of Reed and Pick for different simple fabrics.
6. Preparation of stripes and checks using 2 or more colors with and with out plain weave.
7. Preparing of designs for shirting and Suiting from different blended materials.
8. Preparation of patterns for bed sheet, upholstery, furnishing fabrics.
9. Analysis of data for compound structures.
10. Analysis of extra warp and extra weft and other complex structures.
11. Planning of loom equipment to produce simple and complex fabrics.

16TF211 TEXTILE WET PROCESSING

Hours Per Week :

L	T	P	C
3	-	3	5

Total Hours :

L	T	P
45	-	45

WA/RA	SSH/HSH	CS	SA	S	BS
15	15	-	-	-	10

Course Description and Objectives:

This course introduces the fundamental concepts in dyeing of various fibers and its bonding with different classes of dyes. It also includes methods and different styles of printing. Finally it deals with finishing of textile and need for effluent treatment plant . Objective of this course is to impart fundamental concepts of chemical processing of fabric.

Course Outcomes:

The student will be able to:

- understand grey fabric preparation for processing.
- know the dyeing of fabric using different classes of dyes.
- differentiate different methods and styles of printing.
- understand the importance of finishing and different types of finishes.
- aware of importance of effluent treatment plant.

SKILLS:

✓ *Select the preparatory process for grey fabric preparation.*

✓ *Identify suitable classes of dyes for the selected fibers.*

✓ *Printing of the different fabrics with suitable dyes as well as pigments.*

✓ *Compare the shade of original sample with dyed sample by using Computer Color Matching system.*

✓ *Find usefullness of particular finish for the specific application.*

UNIT - 1 **L-9**

GREY PREPARATION : Singeing, Desizing and its types, Scouring - Purpose and process, batch, semi-continuous and continuous methods of scouring. Bleaching of cotton goods with sodium hypochlorite, hydrogen peroxide and sodium chlorite. Mercerization - objects and principle of mercerization, yarn mercerization, fabric mercerization.

UNIT - 2 **L-9**

DYEING : Fundamentals, Classification of colorants, Difference between dye and pigment, Common terms used in textile coloration, Different kinds of dye-fibre bonds for common fibres, Dyeing of cotton with direct, reactive, vat dyes, Dyeing of wool and silk with acid and basic dyes, Dyeing of polyester with Disperse dyes, Principle of computer-aided color matching.

UNIT - 3 **L-9**

PRINTING : Methods of printing - Principles of block printing, roller printing, flat-bed and rotary-screen printing, and transfer printing techniques. Styles of printing - Principles of direct, discharge and resist styles of printing, printing with reactive dyes, Printing with pigments, study of chest and rotary screen printing machines for knitted goods.

UNIT - 4 **L-8**

FINISHING : Classification of textile finishes - Mechanical finishes: calendaring and its types, mechanical shrinking (Sanforising), Compacting of knitted fabric. Outline of functional and aesthetic finishes - wrinkle-free finishing of cotton fabric (resin finishing), UV-protective finish, antimicrobial finish, flame-retardant finish, water-repellent finish, soil release finish.

UNIT - 5 **L-10**

PROCESS HOUSE EFFLUENT AND ITS TREATMENT : Nature of effluents in chemical processing, Effect of waste water discharge on the environment, Government standards for textile chemical process effluent discharges, Treatment of dye house effluent, operations in an ETP and methods for removal of color in dye house effluent, azo dyes and major banned amines, guidelines for eco-friendly processing.

ACTIVITIES:

- *Interpretaion of of computer colour matching data.*
- Dyeing of fabric with natural dye using different mordants.
- *Identification of various defects within the dyed and printed fabrics.*
- *Collection of different finished samples in regular use.*
- *Analysis of tirupur case study for ETP.*

LABORATORY EXPERIMENTS

Course Outcomes:

Upon completion of this course, the student will be able to

- Perform the grey fabric preparation for processing.
- Perform the dyeing and different classes of dyes used.
- understand different methods of printing, styles of printing.
- understand the importance of computer color matching.

LIST OF EXPERIMENTS Total hours: 45

1. Scouring of cotton using alkali-boiling method.
2. Bleaching of cotton using hydrogen peroxide.
3. Dyeing of cotton with direct dyes & Reactive cold brand dyes.
4. Dyeing of cotton with Hot brand reactive dyes.
5. Dyeing of cotton with vat dyes.
6. Dyeing of silk, wool or nylon fabric with acid dyes.
7. Determination of color fastness to washing, Light and rubbing.
8. Printing of cotton with reactive dyes using blocks and screens.
9. Direct printing of cotton with pigment colors using screens.
10. Discharge and resist styles of printing on cotton.
11. Printing of polyester with disperse dyes.
12. Dyeing of cotton fabric with pigments using padding method and the dyeing of cotton fabric with vat dyes by the pad-jig method.
13. Dyeing of polyester using a lab-scale HTHP machine and dyeing of knitted fabric in a lab-model winch machine.
14. Computer-aided color matching.

TT317 TEXTILE TESTING–I

Course Description & Objectives:

This objective of this course is to understand different testing methods for fibres and yarns.

Course Outcomes:

1. *Students will able to understand basic testing of fibres and yarns.*
2. *The student will also understand the basic property of materials and characterization techniques.*

UNIT I - Introduction to Textile Testing:

Objectives of testing – determination of Sample size for testing & Selection of samples for testing – Sampling errors – Point estimations of mean and variance Interval estimation of mean and variance – Number of tests – Significance test: t test , Z test and ANOVA with application to textile. Random and Biased sample – Length and extent biased samples – zoning technique for raw cotton

UNIT II - Fibre Testing-I

Measurement of Regain and Moisture content – Corrections for regains – Numerical examples. Hygrometers: Hair and Digital hygrometer – Factors affecting the regain – Effect of moisture on fibre properties – Drying oven – Shirley moisture meter.**Fibre Dimensions:** Fibre length measurement – Fibre sorter methods – Analysis of Sorter diagrams – span length –Fibrograph and uniformity index | Fibre fineness –important of fineness- measurement by gravimetric, microscope, vibroscope – air flow methods – Principle – WIRA Fineness meter for cotton– Sheffield Micronaire

UNIT III - Fibre Testing-II

Determination of Maturity of cotton – Maturity ratio – Maturity count – Measurement of maturity of cotton fibres, Terminology related to Tensile properties of Textiles – Measurement principles CRL CRE and CRT –

Measurement of Fibre strength – Pendulum lever principle – Stelometer, strain gauge principle – Instron Tensile Tester. Latest Testing instruments like AFIS, HVI and their use – Measurement principle and different modules with data analysis

UNIT IV - Yarn Testing-I

Yarn Dimensions: Yarn numbering system – Measurement Linear density by skein gauge, wrap reel Beesley's yarn balance –wist factor – Effect of twist on yarn and fabric properties – Measurement of Twist by direct, continuous, tak-up twist and twist to break methods – Measurement of yarn strength by Single yarn test and lea test –CSP and RKM.Importance of yarn friction in textile industry – General mechanism of friction – laws of friction – Measurement of friction by various methods –Yarn-on-Yarn Friction – Bartlett smith and Thompon's inter fibre friction method – Uster Zweigle Friction Tester

UNIT V - Yarn Testing-II

Measurement of hairiness by Shirley yarn hairiness tester, Zweigle G565 and Uster tester 3 hairiness meter – Evenness testing of silvers - rovings and yarns – Analysis of periodic variations in mass per unit length – Index of irregularity – limit irregularity – addition of irregularities – Eveness Tester (Uster evenes teste) - Random occurring faults (Uster classimat) - Spectrogram - variance length curves analysis The causes and effects of irregularity.

TT 319 TECHNOLOGY OF PREPARATORY AND DYEING

Course Description & Objectives:

The main aim of this course is to give the detailed idea about textile wet processing. From the preparatory process to coloration of the textile fibre, yarn and fabrics are discussed in detail. The measurement of colour and whiteness is also covered.

Course Outcomes:

1. *Students will able to understand the importance of wet processing of textile yarn and fabric.*
2. *They will able to find the effect of different process chemistry and machine related to the process.*
3. *They will know the characterization of the processed fabrics.*

UNIT I - Introduction, Singeing & Desizing

Introduction to Wet Processing: Requirements of water for dye house, calculation based on fabric G S M, Wetting, contact angle, detergency, types of surface active agents | **Singeing:** Objects, need, sorts signed, methods, problems | **Desizing:** objects, methods: conventional and enzymatic.

UNIT II - Scouring & Bleaching

Scouring: Objects, scouring loss % and its effect on fabric properties, conventional and modern methods. Scope of quality control aspects in textile wet processing

Bleaching: Need and sorts bleached, objects, methods, combined scouring and bleaching, machines & quality control, Washing machines, recycling of water.

UNIT III - Mercerizing & Dyeing

Mercerization: Need and sorts mercerized, Parameters and their effect on the product changes in cellulose after mercerization, methods of mercerization, Liquid ammonia mercerization - quality control aspects.

Introduction to Dyeing: Chemical constitution colour and its elements, Physical chemistry of dyeing, parameters of dyeing, theories of dyeing, Kinetics of dyeing Classification of dyes.

UNIT IV - Dyeing Process & Effuelent Treatment

Dyeing of Natural & Man Made Fibres: Dyeing of 100 % fibres selection of dyes and dye shade, effect of parameters of dyeing on fabric properties, application of Direct, Reactive, Basic, Acid, metal complex, Dyeing with Disperse, Vat, Sulphur dyes (dyeing procedures only).

Processing of Textile Effluents: Need for effluent treatment, collection, examination, characteristics of effluents arising of cotton, wool, silk and man made fibre fabrics, concepts of BOD and COD, Treatment methods, primary treatment, secondary biological treatments, tertiary treatment methods, recovery and reuse of waste water.

UNIT V - Color Theory

Colour Measurements: Relation between light and dye, dye and eye. Light, colour and electromagnetic spectrum, Theories of colour vision, Colour primaries and colour mixing – Additive and subtractive, Colour specification – Munsell colour order system, Ostawald colour system, CIE system, CIE lab System, Hunter lab, Tristimulus values, Standard observer, Metamerism and Dichroism. Sample preparation for CCM Application to textile processing, Advantages & limitations of CCM, Colour difference, Assessment of whiteness, yellowness and brightness, Recipe formulation

TT 321 FABRIC STRUCTURE AND DESIGN

Course Description & Objectives:

The main aim of this course is to understand and indentify various structure of the fabric with their applications.

Course Outcome:

1. *Students will able know and identify variety of fabrics with its loom equipment planning accordingly.*
2. *Students will also be able to understand various structure of the fabric in detail.*

UNIT I - Introduction To Fabric Structure

Method of weave notation – elements of fabric structure –Fabric Structure & Texture compared- Warp faced,weft faced, equi faced weaves, fabrics, constructions Selection of Reed and its importance-design, draft, denting and peg plan – their inter relation – classification of weaves – modification of plain: as warp rib, weft rib, matt, fancy matte, stitched hopsack – classification of plain clothes.

UNIT II - Twills & Fancy Structures

Characteristics of Twills, twill angle, twist and twill interaction, Twill modification: wavy, herringbone, combined, broken, steep, flat, skip twills, sateen and satin, modification of Floating weaves – fancy weaves: honey comb-Huck-A-Back-Mock-leno: Basic designs, distorted thread effects (warp and weft way).

UNIT III - Fabric Structure & Design

Crepe Weave:Different methods of construction – colour and weave effects: Theories of colour, Effect produced by simple colour and weave combinations– classification of advanced fabrics – extra thread figuring – bed fords and welts or piques – backed cloths: reversible and wadded backed cloths.

UNIT IV - Advance Fabric Structures-I

Double Clothes: Principles of stitching, reversible, wadded, inter changeable double cloths - treble cloths: principle of stitching – weft piles: plushes & corduroys, A brief note on Warp plies, Velvets.

UNIT V - Advance Fabric Structures-II

Terry Piles: Terry motion, Terry ornamentation, Dobby striped & Check effects in Terry-Gauze & Leno: principle, Sheds formed in Leno, Designs for simple leno - Damasks and brocades: twilling jacquard, method of developing a design for Damask (Planning for Loom production).

TT 323 ADVANCED YARN MANUFACTURING

Course Description & Objectives:

This Course Teaches The Students About Fundamental Concepts Of Different New Spinning Techniques And Texturising Methods.

Course Outcomes:

At the completion of this course, the student should be able to

1. Understand the concepts and differentiate the advantages of new spinning processes.
2. Evaluate the different spinning systems w.r.t yarn structures and properties.

UNIT I - Rotor Spinning

Limitations of ring spinning – principles of open end spinning – principles of rotor spinning – opening roller specifications for cotton and synthetics – Tangential and radial feeding – back doubling concept - external and internal suction device – rotor groove geometry – their influence on design parameters and dimensions of rotor – spinning performance doffing tube and false twist effect – take up and package formation – auto piecing systems – rotor yarn properties – calculation of twist, machine constant and production.

UNIT II - Twistless, Self Twist & Airjet

Twist-less spinning – Tekja process – TNO, TWILO. **Self twist spinning** – Repcospinning – developments

Air-jet / Vortex spinning – principle of formation of wild, core wild, wrapper, wrapper wild fibers – machinery details – yarn structure and properties.

UNIT III - Friction, Siro Spinning

FRICTION SPINNING: Introduction – frictional forces – mechanism of friction spinning – DREF-I, II , III, V, 2000 and 3000. Yarn structures, properties and end uses.

Comparison between Ring, rotor, Air-jet and friction yarns

SIRO SPINNING principle – comparison between SIRO yarn and double yarn.

COMPACT SPINNING – methods – yarn structure and properties

UNIT IV - Texturising Part-I

Texturing – Objects – importance – textured filament and spun yarns comparison.

Methods of texturising – false twisting principles – process variables – study of draw texturing machines – raw material POY – quality – creel zone – twisting zone and winding zone – role of draw ratio and D/Y ratio and their selection – properties of draw textured yarns Stuffer box crimping – Edge crimping – knit & de-knit process – gear crimping – friction texturing.

UNIT V - Texturising Part -II

Air texturing – methods and developments – Properties and applications of air textured yarns.

Texturamat and dynafil – M.Thermal stress tester – quality control in texturising – textured yarn defects.

TT325 PHYSICAL PROPERTIES OF TEXTILE FIBRES (ELECTIVE-I)

Course Description & Objectives:

Physics plays a large part in textile technology and study of the structure and physical properties of fibres, yarns, and fabrics forms is called textile physics, which is an essential part of the education of any textile technologist. The present course deals only with the fibre properties, augmented by an introduction to fibre structure.

Course Outcomes:

1. *Students will able to understand the importance of fibres characterization.*
2. *They will know different fibre characterization technique.*
3. *They will able to know the effect of different external effect on structure and property of fibres.*

UNIT I - Fibre Structure

Introduction to fiber structure – Micellar theory, continuous theory, fringed micelles theory, fringed fibrils theory, modified fringed micellar theory – fine structure of natural, fine structure and cross-section of regenerated and synthetic fibres, Importance of studying fine structure, requirements for fibre formation (Definitions of parameters which characterize most important features) – Degree of order, degree of localization of order, length/width ratio of localized units, degree of orientation, Degree of polymerization

UNIT II - Characterization Techniques And Density

Brief introduction of Methods of investigating textiles – X – Ray diffraction, IR, NMR, Thermal Analysis, Optical microscopy, Electron microscopy, Scanning Electron microscopy.

Fibre density – Measurement, Relation between density and order - Equilibrium absorption of water, Relation between regain and RH, Comparison of relation between regain and RH of various textile fibres (influence of temperature)- Heat of sorption – measurement of sorption.

UNIT III - Moisture And Tensile Properties

Diffusion of moisture, penetration into a dry fibre, conditioning of mass of fibres, Retention of liquid water, Swelling – introduction to theories of moisture sorption, effect of hydrophilic groups – Absorption in crystalline and non-crystalline regions, Hysteresis – a molecular explanation. Tensile properties – factors determining the results of tensile experiments, load elongation and stress-strain curves.

UNITIV - Mechanical Conditioning And Static Electricity

Effects of variability – Introduction to elastic recovery – Mechanical conditioning, time effect – Creep, Flexural, Torsional Rigidity – Significance of Dielectric Properties for Textiles-measurements-effect of moisture and temperature - static electricity-significance.

UNIT V - Heat Setting

Heat Setting of Textile Fibres: Introduction to heat Setting, need, objectives, types of setting, mechanism of temporary and permanent set, physics of setting, set between fibres, set with in the fibres, synthetic fibre structure and setting, measuring efficacy of setting. Thermal conductivity- structural changes in fibre on heating.

TT327 PROCESS & QUALITY MANAGEMENT IN TEXTILES (ELECTIVE-I)

Course Description & Objectives:

With increasing the demand of quality and higher production, it is very important to control the process parameters. The course deals with the identification of key variable and their control.

Course Outcomes:

1. *From this course students would be able to learn process control at different departments in textile industry to achieve better quality of fabric.*
2. *To understand the need of PQC*

UNIT I - Process Control In Blow Room, Card & Draw Frame

Introduction to Process Control: Meaning, Applications to whole Textile Production from fibre to fabric – Process Parameters controlling production, quality – Introduction to quality control: Tools available, selection and interpretation.

PQC in Blow Room, Card & Draw Frame: Raw Material Management: Importance, need of instrumental evaluation, traditional methods of cotton selection, importance of cost in raw material, cotton marketing, linear programming for mixing, bale management yarn engineering & raw material. Blow Room: Control of mixing quality – control of yarn realization (Records and Accounting) – Control of waste and Waste extraction study - cleaning in Blow room (Individual and Overall cleaning efficiency of Blow room). Card: Waste extraction at card, Nep study & control, Snap Study card. Draw Frame: Breakage study, Stop motion checking, Use of NILO meter, Drafting rollers pressure checking (Carbon paper technique).

UNIT II - Process Control In Comber, Simplex & Ring Frame

Comber & Comber Preparatory: Significance & importance of good lap for comber, evaluation of comber performance, fractionating efficiency of comber, comber waste analysis, influence of various factors on combing performance-5 minute test, headwise and Overall waste at Comber. Speed Frame: Breakage study at Simplex. Ring Frame: Breakage study, Snap study, & Idle spindle study, Analysis of Snap efficiency and reasons for low snap efficiency. Measurement and analysis of productivity means to improve productivity, control of yarn quality: count, strength and their variability, yarn unevenness and imperfections, yarn faults and package defects, implementation of process control in cotton spinning.

UNIT - III PQC WINDING, WARPING & PIRN WINDING:

Process & Quality Control in Winding Scope, Optimizing of Yarn tensioning and clearing (settings for different kinds of yarns) Producing good package, Snap and breakage study, unwinding tension and optimum guide distance, Breakage and snap study in Auto coner (formats) Approach to control of productivity, Requirements of dye package.

Process & Quality Control in Warping: Scope, breakage study, Effort to minimize the breakage rate, quality of warper beams, breakage study in warping (norms), productivity, warping defects and remedies. Process & Quality Control in Pirn Winding: Scope, GO-NOGO gauge, Minimizing the end breaks, improving the build of the yarn, control of speed, productivity – Pirn quality checking report.

UNIT IV - Pqc In Sizing & Loom Shed

Process & Quality Control in Sizing: Scope, choice of size receipe and measurement of size pick up, control in size preparation, Lappers study, breakage study, control of size pick up, controlling sizing conditions, stretch control in various zones, moisture control, Migratory behavior study (ATIRA technique) quality of sized beams, positive feed to sow box, productivity, Dead loss and its control, hard waste and its control, Testing of Size Ingredients, testing of sized yarn - Selection of reeds and healds, care of reeds, effect of reed parameters on weaving performance.

Approach to Process & Quality Control in Loom Shed: (Non– auto and Auto loom shed) scope, control of speed, breakage and snap study in loom shed, determination of labour allotment (ATIRA procedure) Norms for breakage rate, No. of looms/operative, control of efficiency (concept of calculated and expected efficiency), control of loom stoppages (due to warp and weft break, shuttle change etc.)

UNIT V - Process & Quality Control In Chemical Processing

Scope, functions of control house, grey cloth inspection, Process control measures in Bleaching and mercerizing (method to estimate the concentration of caustic and silica in peroxide bleach, absorbency of bleached cloth, Cuprammonium fluidity, ash content, barium activity no. luster no. fastness of bleaching), Process control in dye house: parameters for process control in different forms of dyeing (yarn and fabric), test method to determine the caustic and Hydros conc. In vat dye liquor, Process control in Printing and Finishing: Scope, Approach to process control, test for the suitability of thickner in the print paste formation, iodine absorption test for the evaluation of degree of resign cross linking, fastness properties of dyed and printed goods to wash, light perspiration and water, Fastness to rubbing, hot press, Optimal brightness test for the uniformity of cross linking, assessment of degree of heat setting in polyester by Iodine absorption method.

TT329 MECHANICS OF TEXTILE MACHINERY (ELECTIVE-I)

Course Description & Objectives:

This course deals with the mechanisms of textile machinery and humidification of the textile plants.

Course Outcomes:

At the completion of this course, the student should be able to

1. *Understand the different Concepts in various services required in Textile manufacturing.*

2. *Understand different gearing mechanisms and calculate the output speeds through various channels*
3. *Understand and design Cams and tappets for different applications*
4. *Understand terminology and concepts in Humidification systems*
5. *Understand terminology and concepts in Compressor systems*

UNIT I - Introduction to mechanics

Introduction – equations of motion – motion in a circle – transmission of motion by wheel gearing – Textile applications from fibre to finished fabric – Balancing of revolving and reciprocating masses. Belt drives – Flat and V-belts comparison – belt slippage, effect of belt thickness – effect of initial tension – effect of centrifugal force – horsepower transmitted – rope and chain drives – brief note on fast and loose pulley , jockey or rider pulley , grooved pulleys etc

.

UNIT II - Mechanisms & its applications in Textiles

Determination of speed ratio in planetary mechanisms – applications in textile industry – stepped pulleys – designing method – applications in textile industry – Mechanics of yarn winding – study on breaks and clutches – Applications of clutch and break in textile production. Feed regulation motion in Scutcher , - designing of cone drums for blow room and speed frame – construction of displacement – velocity and acceleration diagrams – kinetics of shedding – picking power for picking, picking as an elastic mechanism and beat – up: eccentricity of slay , derivation for 'e', displacement, velocity and acceleration of slay .

UNIT III - Cams & Secondary motions

Construction of cams and tappets – heart shaped, 3 leaved – plain, twill tappets – derivation to show that the frictional force 'F' is directly Proportional to the distance of weight from the fulcrum in negative let off motion – Backrest mechanisms – angular velocity of warp beam.

UNIT IV - Humidification

Humidification in Textile Mills: Need for humidification in T extile Mills, Ambient conditions required in various departments of a textile mill, Psychrometry - definition, use of psychrometric charts, various psychrometric processes like cooling, heating, humidification, dehumidification, etc. Aspects of evaporating cooling method & refrigerative cooling method, S tudy of arrangement s & layout of standard humidification methods for spinning, weaving & knitting processes – Return air ducts, Return Air Plenum, Filters, Return Air fans, Dampers, Supply Air Fans, Washers, Eliminators, Supply Air Plenum, Supply Air Duct, Diffusers etc. Study of the construction of each component, Return Air & Supply Air openings in the department, Automatic controls in humidification plants, Study of recent developments in humidification plant used in spinning, weaving, knitting departments.

UNIT V - Pumps, Compressors & Fans used in Textile Mill

Pimps: Classification & characteristics of various types of pumps, Study of types of pumps used in textile mills.

Compressors: Compression methods, intermittent, continuous, Classification of compressors & brief study of construction, working, advantages, limitations of each type, Compressed air requirement in Textile mills, Compressor accessories such as reservoir, dryer, lubrication system, filters, cooling towers, etc.

Fans: - Classification, construction & working of different classes of fans, Centrifugal, Axial flow & Radial flow, Fan capacity , power & efficiency , Fan selection, Pneumatic conveying of materials in textile mills.

TEXT BOOKS:

TT 331 TEXTILE TESTING– I LAB

Course Description & Objectives:

This objective of this course is to understand practical concepts of different testing methods for fibres and yarns.

Course Outcomes:

1. *Students will able to perform basic testing of fibres and yarns.*
2. *The student will observe various fibre and yarn properties practically*

LIST OF EXPERIMENTS

1. Identification of textile fibers under microscope (Demonstration).
2. Determination of fiber maturity by NaOH swelling method and differential dyeing techniques.
3. Determination of fiber length by Bear Sorter and Interpretations by other methods.
4. Determination of fiber fineness by ATIRA fineness tester.
5. Determination of fiber strength by Stelometer.
6. Determination of yarn count by Beesley's yarn balance.
7. Determination of yarn count by Wrap reel.
8. Determination of single and plied yarn twists.
9. Determination of moisture content of cotton material.
10. Determination of Single Yarn Strength.
11. Determination of CSP and CCSP of Yarns
12. Determination of Regain of different fibers.
13. Determination of ginning percentage.
14. Determination of fiber length by Hallo and Butterfly Method.

III Year B.Tech. Textile Technology - I - Semester	L	T	P	To	C
	-	-	3	3	2

TT 333 TECHNOLOGY OF PREPARATORY AND DYEING LAB

Course Description & Objectives:

The main aim of this course is to make coloured fabric from grey fabric. This process includes different preparatory as well as dyeing of different fabric by different dyes. The students will perform experiments of their own to make coloured fabric.

Course Outcomes:

1. *Students will able to understand the importance of wet processing of textile yarn and fabric.*
2. *They will able to find the effect of different process chemistry and machine related to the process.*
3. *They will know the characterization of the processed fabrics.*

LIST OF EXPERIMENTS

1. Grey Fabric Inspection and defect Analysis from Processing point of view.
2. Conventional & Enzymatic Desizing of cotton and effect of desizing fabric properties.
3. Conventional Scouring of cotton and effect on fabric properties.
4. Bleaching and Optical Whitening agents treatment of cotton and effect on fabric properties.
5. Combined desizing, scouring and bleaching of cotton fabric
6. Bleaching and Optical Whitening agents treatment of wool and effect on fabric properties.
7. Mercerisation of cotton and effect on fabric properties.
8. Dyeing of Cotton with direct dyes and effect on fabric properties.
9. Dyeing of Cotton with reactive dyes and effect on fabric properties.
10. Dyeing of silk and Wool with acid dyes and effect on fabric properties.
11. Dyeing of polyester with disperse dyes and effect on fabric properties.
12. Dyeing of acrylic with basic dyes and effect on fabric properties.

III Year B.Tech. Textile Technology - I - Semester

L	T	P	To	C
-	-	3	3	2

TT 335 FABRIC STRUCTURE AND DESIGN LAB

Course Description & Objectives:

The main aim of this course is to understand and indentify various structure of the fabric.

Course Outcomes:

1. *Students will able know and identify variety of fabrics with its loom equipment planning accordingly.*
2. *Students will also be able to identify different structure of the fabric.*

LIST OF EXPERIEMENTS

1. Identification of basic features of fabrics and Need for Analysis.
2. Analysis of different types of warp faced, weft faced and equifaced plain fabrics.
3. Analysis of different types of Twill fabrics.
4. Analysis of different types of Sateen fabrics.
5. Selection of Reed and Pick for different simple fabrics.
6. Application and Identification of ISI standards.
7. Preparation of simple patterns using Pigment and Light theory of color on geometric base.
8. Preparation of complex patterns using Pigment and Light theory of color on all over base.
9. Preparation of stripes and checks using 2 or more colors with and without plain weave.
10. Preparing of designs for shirting and Suiting from different blended materials.
11. Preparation of patterns for bed sheet, upholstery, furnishing fabrics.
12. Preparing of curtain clothes on all over concept with different basis using drop devices.
13. Analysis of data for compound structures.
14. Planning of loom equipment to produce simple and complex fabrics.
15. Analysis of plain, dobby patterns using computer aided textile design.
16. Analysis of extra warp and extra weft and other complex structures.

III Year B.Tech. Textile Technology II - Semester

L	T	P	To	C

TT322 TEXTILE TESTING – II

Course Description & Objectives:

This objective of this course is to understand different basic and advanced testing methods for fabric.

Course Outcomes:

1. *Students will able to understand basic testing of fabric with some special test of technical fabric.*
2. *The student will also understand the basic property of materials and characterization techniques.*

UNIT I - Fabric Diamensions And Strength

Scope of fabric testing – Importance of fabric testing – Standards for tests – classification of fabric properties, Properties of fabrics as Tailor made – Fabric dimensions like length, width, fabric weight, threads/inch (Densimeter) – crimp measurements– Measurement of thickness. **Tensile Testing of and Fabrics:**, classification of Tensile testers and working along with adjustments to suit the material under test – Automation in tensile testers –Methods for testing tensile strength of fabric – Tearing and factor affecting tearing strength– The Elmendorf tearing tester,

UNIT II - Fabric Abrasion And Stifness

Methods for testing burst strength by Hydraulic diaphragm method, Factors affecting abrasion resistance – The Martindale abrasion tester– Pilling resistance of fabrics – ICI pilling box tester –pilling evaluation subjective and objective (by image capturing). Fabric stiffness: Bending, shear and compression properties of fabrics –Methods for testing fabric shearing compression– Measurement of bending by Shirley stiffness tester and hanging loop method

UNIT III - Fabric Handle And Comfort

Fabric drape and handle – Measurement of Drape by drapameter– Crease and wrinkle behavior – Measurement of crease recovery. Air permeability – –

Air, water and water vapour transmission through fabrics – measurement of WVT by cup method and sweating garded hot plate method – Wicking Test: longitudinal and traverse – Wettability of textile fabrics. Water repellency: spray rating– Bundesmann water repellency test –WIRA shower test .

UNIT IV - Thermal Resistance And Fastness Of Fabric

Thermal resistance of fabrics – Togmeter – Fabric Friction tester. Fabric Friction measurement by simple and i nclined plane test– Flammability – Terminology related with flammability – Measurement of flammability by inclined plane method-Assessment of color fastness – Measurement of Fastness to Washing, Light, Perspiration, Rubbing for dyed goods.

UNIT V - Advance Testing

Diamensional stability: Hygral expansion, relaxation shrinkage, swelling shrinkage, Felting shrinkage, Measurement of Dimensional stability- – Fabric low stress mechanical properties, FAST and KES-F. Brief Introduction to special tests for technical textiles: moisture management tester – Wet Barrier Tester–Puncture Test–Cone Drop Test–Tension creep–Radiant Heat Transmission Tester–Thermal insulation tester TIV –Limited Oxygen Index Tester–Instrument for Run test–Surface Resistance Tester.

TT 324 TECHNOLOGY OF PRINTING AND FINISHING

Course Description & Objectives:

Main objective of this course is to study thoroughly the printing and finishing of textile fabric. Different methods and style of printing has been discussed. The after finishing becomes the final product. The evolution and durability of the process is also discussed.

Course Outcomes:

1. *Students will able to understand the importance of printing and finishing (value addition) of textile yarn and fabric.*
2. *They will able to find the effect of different process chemistry and machine related to the process.*
3. *They will know the characterization of the processed fabrics.*

UNIT I - Textile Printing And Process

Introduction of Printing: Differences between printing and dyeing styles of printing Direct, Discharge and Resist styles of printing Methods of printing, Block , roller, screen and transfer methods Defects in printing and their remedies.

Printing Paste: essential ingredients and their functions, Types and properties of thickening agents Rheology of printing paste, methods of measuring it.

Printing Procedure: preparation of fabric for printing, preparation of printing paste, printing, drying after printing, dyestuff fixation final treatment (washing off).

UNIT II - Style Of Printing

Brief discussion on printing recipes direct, discharge and resist styles of printing, Printing of cotton and viscose Rayons, Wool and Natural Silk, Nylon, Polyester and its blends, Arcylics.

UNIT III - Textile Finishing And Easy Care Finish

Introduction to Finishing: Objectives of finishing, drying of textile with emphasis on stenter drying, calendaring, different types, raising and shearing.

Shrinking Process: Mechanism of shrinkage pre shrinking of cotton goods and machines used.

Crease: Mechanism for crease formation. Wash and wear finish, Durable press finish, Brief description of DMU, DMEU, DMDHEU and DMEDHEU, Dimethylol ethyl carbonate, Dimethlolethyl triozone, non formaldehyde anti crease agents.

UNIT IV - Softening And Special Finish

Special Finishes: water proof finishes, water repellent finishes, flame proof, flame retardant finishes, moth proof, mildew finish, softening and silicon finishes. stiffening agents, Soil release finish, Anti static finish, Anti pilling finish.

UNIT V - Finishing Of Wool And Colour Fastness

Finishing of woolen goods, felting of wool, milling, defelting of wool, setting of woolen goods, crabbing, potting, decatising and heat setting of synthetic fibres.

Colour Fastness of Dyed and Printed Goods: General Principle of colour fastness testing, sample preparation, multifibres, grey scale, conditions of viewing and illumination. Colour Fastness to washing, Rubbing, Perspiration, Light, Sublimation, Bleaching with hypochlorite and Peroxide, atmospheric ozone, Dry-cleaning and saliva.

TT326 TECHNICAL TEXTILES

Course Description & Objectives:

Main objective of this course is to study new evolving field of textiles for its technical applications.

Course Outcomes:

1. *Students will able to understand utilization of textiles for functional use.*
2. *They will know in detail the manufacturing, property and application of textile other than apparel*

UNIT I - General Technical Textiles

Classification of textiles according to tailor made, brief note on technical yarns, fabrics, and fabric structures, scope of industrial textiles, influence of man-made fibre, manufacturing techniques of industrial textiles, Industrial sewing threads and their manufacture, Nomenclature, textiles in agriculture, diary and horticultural applications, textiles in cigarettes, Paper machine clothing, structure and manufacture of former, drier and wet felts, Requirements of these felts, Textiles in conveyor belting, power transmission.

UNIT II - Textiles For Defense & Survival

Requirements, parade clothing, Canvas for defence, Combat clothing, Water vapour permeable clothing, Breathable clothing, Camouflage systems, Deceptions, Decoys, Types and methods, Colour and patterns, Camouflage for UV, IR, antiradar and multiple spectral camouflages, cut resistant Conductive Textiles, Protective clothing for extremely cold region, sleeping bags, Ballistic protective armours and accessories, Aerospace Textiles, Fabrics for nuclear, biological and chemical protection.

UNIT III - Medical & Transportation Textiles

Brief study of applications of textiles in medical field : Classification, Sutures, surgical drapes, masks, Hospital textiles, Textiles for Orthopeadcs, Intelligent bio medical textiles, Textiles in Transportaion**:** tyre cord ,cross section of passenger tyre, Manufacture of tyre cords, types of tyres, Textiles in automobiles, Textiles in electrical and parachute applications, hose canvas, duck fabrics, Air bags.

UNIT – IV - Advance Textiles-I

High Performance Fibres: Manufacture, properties and applications of Basalt, ultra high modulus fibres like aramid and carbon. **Textiles in Filtration and Sports:** Textiles in filtration media, methods of filtration, selection of textiles for filtration, Coated fabrics and high performance coated fabrics, fabric structure for coated fabrics, coating materials and methods, Textiles in acoustical applications, Textile materials in sports and recreations: scope,

UNIT V - Advance Textiles-II

Textiles in Construction: Geotextiles, Requirements, Properties, Functions - Applications, biodegradable Geo Textiles, testing of Geo Textiles. Architectural fabrics: Building structure, application of GT in vertical dams, Roofing materials, Awnings and Canopies. **Textiles in Composites:** Textile Reinforced Composites, Knitted fabric reinforcements, High performance pp composites, Hybrid yarns for composites.

TT328 SHUTTLE LESS WEAVING

Course Description & Objectives:

This course deals with the shuttleless weaving machines and their technologies. Now a day's industries are using shuttle less weaving machines which have good features.

Course Outcomes:

1. *At the completion of this course, the student should be able to:*
2. *Understand shuttleless weaving machines such as projectile, rapier, air&water jet weaving and multiphase weaving.*
3. *Understand their technological changes*
4. *Understand how the these machines effect on productivity and quality etc.*

UNIT I - Introduction to Shuttleless weaving

Introduction: Limitations of shuttle loom with respect to weaving process, engineering aspects & environmental aspects, Classification of shuttleless weaving machines based on the weft insertion rate – selection of looms based on the sorts and quality required - conditions required for high speed weft insertion – requirements for shuttles weaving in Winding, Warping, Sizing and Post Sizing operations - Selvedges and their requirements, (Different types of selvedges found on modern looms)- Techno - economic aspects of modern weaving – Common types of shedding motions, let-off motions, take-up motions found on modern looms.

UNIT II - Projectile & Rapier Weaving

Projectile Weaving Machine: Weft insertion stages – tuckin selvedge formation - Projectile picking concept, picking motion, picking phases, Projectile acceleration & retardation, torsion rod details, Projectile preparation for picking, selvedge motion, Receiving unit, MIS, pick finding, Multi colour weft insertion, weft stop, warp stop, whip roller, weft brake etc. Fabric defects & remedies.

Rapier Weaving Machine: Classification of rapiers – Makes of rapiers and classification - Concept of Dewas & Gabler rapier systems – Principles of different single & double rapier weft insertion systems (Drives), their comparison, Study of rapier heads, Rapier motion drive details, Details of rapier tape, head, guiding elements, Gripper openers, cutters, stroke adjustment, Specifications of rapier & head for various applications, Fabric defects & remedies, weft waste during selvedge formation.

UNIT III - Jet Weaving

Air Jet weft Insertion: Introduction & history, Classification of air jet weft insertion - stages of weft insertion - main nozzles designs, relay nozzle designs, configurations, Loom settings, Air supply & energy consumption, Air flow in nozzles & guide channel, performance of yarns in air jet insertion, Influence of yarn characteristics on weft insertion, application of air jet weaving, features of modern air jet weaving machines, Quality of Air.

Water Jet Weft Insertion: Introduction, Design, Requirements, Picking mechanism, weft insertion elements, loom settings, influence of yarn characteristics, features of water jet looms, applications of water jet weft insertion system, Comparison with air jet.

UNIT IV - Multiphase weaving

Introduction to Multiphase Weaving, features of modern multiphase weaving machines e.g. M 8300, Introduction to Circular Weaving &Triaxial Weaving, Properties & applications of tri-axial woven fabrics.

UNIT V - Narrow fabric weaving & Lables

Technology of Narrow Fabric Weaving: Shuttle looms, needle looms, warp feed systems from beams, creel, for elastomeric yarns, shedding, weft insertion systems, take up Applications of narrow fabrics, Manufacture of Labels.

TEXT BOOKS:

	4	0	-	4	4

TT 330 INTELLECTUAL PROPERTY RIGHTS (ELECTIVE - II)

Course Description & Objectives:

This Course deals the fundamentals of IPR, need and how to use different tools of IPR in fashion and textile business. Patents, copyrights, trademarks, trade secrets etc are covered.

Course Outcomes:

1. *Students will able know the various tools of IPR*
2. *Understand the effect of IP*
3. *Various concepts and methods used by IPR Team in industries.*

UNIT I - Patent

Introduction to Intellectual Property Law – The Evolutionary Past - The IPR Tool Kit- Para -Legal Tasks in Intellectual Property Law Patents – introduction, economic impact of patent on system – Patent document – rights of a Patent – patent drafting – Patent duration - patent Registration Process – Post registration Procedures – Patent maintenance.

UNIT II - Copyright

Introduction to Copyrights – – Principles of Copyright Principles -The subjects Matter of Copy right – The Rights Afforded by Copyright Law – Copy right Ownership, Transfer and duration – Right to prepare Derivative works – Rights of Distribution – Rights of Perform the work Publicity Copyright Formalities and Registrations - Limitions - Copyright disputes and International Copyright Law.

UNIT III - Trademark

Introduction to Trade mark – Trade mark Registration Process – Post registration Procedures – Trade mark maintenance - Transfer of Rights - Inter partes Proceeding – Infringement - Dilution Ownership of Trade mark – Likelihood of confusion - Trademarks claims – Trademarks Litigations – International Trade mark Law.

UNIT IV - Trade Secret

Introduction to Trade Secret – Maintaining Trade Secret – Physical Secrurity – Employee Limitation - Employee confidentiality agreement - Trade Secret Law - Unfair Competation – Trade Secret Letigation – Breach of Contract – Applying State Law Geographical Indication – Introduction - Need – Clauses – Case studies.

UNIT V - Licensing & Franchising

IP Transactions - Transaction Opportunities and relevance of IP - Patent Brokering and acquisition - Due diligence LICENSING – Meaning, Types of Licensing, Important factors to consider when preparing a licensing agreement FRANCHISING - Meaning, Types of franchise system, Traditional licensing Vs Franchising, Advantages and disadvantages, Important factors to consider when preparing franchise agreement MERCHANDISING - Merchandising Vs Merchandising rights, Character and personality merchandising.

TT332 PERSONNEL MANAGEMENT & INDUSTRIAL RELATIONS (ELECTIVE - II)

Course Description & Objectives:

Main objective of this course is to understand about industry and individual psychology.

Course Outcomes:

1. *Students will able know the tasks and the effect of personnel management.*
2. *Understand the effect of industrial relations*
3. *Various concepts and methods used by personnel management in industries.*

UNIT I - Introduction

The field of personnel management: challenge of human relations, problem of human relations, scope of personnel management: managerial phases operative phases of personnel work; objectives, responsibility for personnel management, Personnel executive, education of personnel managers.

Perspective of personnel management: Importance of Perspective. Historical Changes. Cultural and Social Background, Technological Changes. The Role of Government, relations of Labor to Management. Concepts of Labor.

UNIT II - Personnel Problem And Policies

Present and Future Prospects: Approaches to Personnel Problems. Obstacles in the Path of Personnel Management, Factors Contributing to Better Relations; A Changing Philosophy.

Personnel Programming: Scope and Importance of Personnel Programming; Objectives: The Importance of Objectives. Classes of Personnel Objectives. Functions: Nature of Functions. Assignment of Responsibility. Personnel Policies: Nature. Example of Policies. Principles of Personnel Management: Nature. Suggested Principles. Application of Principles. Research Needs of Programming.

UNIT III - Industrial Psychology And Motivation

Introduction to Industrial Psychology: Industrial Psychology defined, meaning scope. Engineering Psychology : Tailors Scientific Management as a base for Engg. Psychology, Work culture and Ergonomics, Industrial Fatigue and methods to overcome.

Motivation: Meaning, Types of Motives, Maslow's and Herzberg's theory of Motivation. Morale: Meaning, Measurement, relation with Motivation, Morale Vs Production, Tips for Morale improvement. Attitudes & Job Satisfaction: Meaning of Attitudes and methods to find employee attitude: Meaning of Job Satisfaction, it s relation to productivity, job satisfaction and interpersonal, factors relating to job satisfaction and job dis-satisfaction.

UNIT IV - Counselling

Personnel Counselling: Meaning, need for counseling, Objective of counseling, Extent of counseling, Forms of Counselling, Steps in Counselling, Techniques of counseling.

Psychological Aspects of Labour Relations: Meaning, concept of Group dynamics, Impact of Hawthorne Experiments. Supervision & Leadership: Supervision: Roles and functions of supervisor, Tasks and processes of supervision, Leadership: Defined, Styles of Leadership, Blacke & Moutan's Managerial Grid, impact of leadership on production.

UNIT V - Industrial Relations And Laws

Industrial Relations: Terminology, Human relation, Industrial relation Vs Human relation, steps to improve human relation in industry.

Industrial Unrest: Manifestation of Unrest in organized and un-organised sector. Trade Union: Def, structure of trade union, objectives and functions of trade union, multi unionism and its pros and cons.

Labour laws: Trade union act 1926, Industrial disputes act 1957, Indian factories act 1948, Minimum wages act, Standing Orders etc. I L O: Objectives, Scope, functions, Structure, Contribution to labour world, Disciplinary Action Against a Worker, McGregor's Hot stove rule.

TT334 LEAN AND SIX SIGMA FOR TEXTILES AND APPARELS (ELECTIVE - II)

Course Description & Objectives:

Main objective of this course is to understand lean and six sigma techniques along with various statistical tools for textiles and apparels.

Course Outcomes:

1. *Students will able know the quality and quality control process.*
2. *Lean and six sigma in any process as well as textile industry will also be covered.*
3. *The student will also know the use of statistical advance technique to reduce cost and improve quality.*

UNIT I - Introduction

Introduction: Definitions: quality, quality control, quality planning, quality assurance, quality management, Total Quality Management (TQM) as per

ISO 8402 - Overview on TQM. The TQM axioms-Commitment, Scientific knowledge, Involvement and consequences of total quality.

Tools and Techniques In TQM: Statistical Quality Control – process capability and performance. Seven quality improvement tools. Taguchi method.

UNIT II – Basics Of Six Sigma

The Basics of Six Sigma: The Problem Solving Strategy Y = f(x), Critical to Quality Characteristics (CTQ's) Cost of Poor Quality (COPQ) Pareto Analysis (80:20 rule) steps to six sigma. Quality circles. Benchmarking – types. Quality Function Deployment (QFD). 5 S concept. Applications in Textiles in Apparel industries.

UNIT III – Lean

Essentials of Lean (6s) Strategies, Background, Statistical Theory of Lean (6s) Strategies, Normal and standard normal distribution, Lean Six Sigma and Principles: Elements of Lean Performance Measurements, Mathematical Modeling of Lean Six Sigma Relations. Creation of Six Sigma Infrastructure.

UNIT IV – Use of Six Sigma

Road Map to Lean (6s) Continuous Improvement: Continuous Improvement Engineering, Definition and Measurement: Phase 0 and Phase 1, Evaluation of Existing Process Sigma/Baseline Sigma, Data Analysis, Optimization and Improvement, Evaluation of New Sigma, Process Control.

UNIT V – Evolution of Integrated Lean Six Sigma

Evolution of integrated Lean Six Sigma Origin of implementing Lean Six Sigma, Six Sigma concepts in textile industry, Lean Six Sigma through ISO 9001:2008 standard based QMS in textile industry, L6QMS-2008 model, Case study in Lean Six Sigma for textile industry.

TEXT BOOKS:

1. Logothetics N, "Managing for Total Quality - From Deming to Taguchi and SPC", Prentice all Ltd., New Delhi, 1997.

TT336 TEXTILE TESTING - II LAB

Course Description & Objectives:

This objective of this course is to understand different basic testing methods for fabric.

Course Outcome:

1. *Students will able to perform basic testing of fabric.*
2. *The student will observe various fabric properties practically.*

LIST OF EXPERIMENTS

1. Testing the fabrics for bursting strength.
2. Determination of crease recovery angle of cotton, man-made and silk fabrics.
3. Determination of Drape co-efficient for textile fabrics.
4. Determination of fabric Tensile strength and elongation.
5. Determination of fabric Tear strength.
6. Determination of Ballistic strength of fabrics.
7. Testing of fabrics for pilling.
8. Determination of stiffness parameters of fabrics.
9. Study of dimensional stability of woven fabrics.
10. Determination of Air permeability of woven fabrics.
11. Wash fastness for different dyed and printed fabrics.
12. Determination of abrasion resistance of fabrics.
13. Blend analysis of fabric by chemical methods.

III Year B.Tech. Textile Technology - II - Semester

L	T	P	To	C

TT 338 TECHNOLOGY OF PRINTING AND FINISHING LAB

Course Description & Objectives:

The main aim of this course is to make finished fabric from pre-treated fabric. This process includes different printing as well as finishing of different fabric by different dyes and chemicals. The students will perform experiments of their own to make finished fabric.

Course Outcomes:

1. *Students will able to understand the importance of printing and finishing (value addition) of textile yarn and fabric.*
2. *They will able to find the effect of different process chemistry and machine related to the process.*
3. *They will know the characterization of the processed fabrics.*

LIST OF EXPERIMENTS

1. Printing of cotton with reactive dyes by using screen printing
2. Printing of cotton with pigment colour by using screen printing
3. To print cotton fabric with resist style of printing using reactive dye as background
4. To print cotton fabric with discharge style of printing using reactive dye as background
5. To print polyester with disperse dye
6. To print Acrylic with basic dye
7. To modify the feel of a fabric by treatment with softening and stiffening agent
8. To impart crease recovery property to cotton by DMDHEU based finish and formaldehyde free system
9. Demonstration of dyeing of cotton on Jigger, winch, Padding mangle, Package dyeing, soft flow dyeing machine and garment dyeing machine.
10. Evaluation of light, wash, rubbing and fastness.
11. Demonstration of computer colour matching system.

TT423 APPAREL PRODUCTION TECHNOLOGY

Course Description & Objectives:

This Course Teaches The Students About Fundamental Concepts Of Garment Merchandising that includes the types of merchandings, product development, sampling procedures, procurement techniques, costing and various channels of sourcing.

Course Outcomes:

At the completion of this course, the student should be able to

1. *Understand the structure of garment industries in India & Globally*
2. *Understand Different concepts and terminology of Garment manufacturing process.*
3. *Understand different concepts in Pattern Making, cutting technology, fusing technology etc*
4. *Understand different types of Stitches and seams*
5. *Understand different concepts in inspection and transportation and warehousing.*

UNIT I - Introduction & Cutting

The Garment Industry: Structure of the garment Industry , sectors of Industry , product types and organization, Apparel industry in India, Domestic industry , size of the industry , nature of the industry , its developments in recent years, Export industry: Size and nature of the industry.

Types of Fabric Packages – Types of Fabrics – One Way – Two Way Fabrics – Their effect on spreading TYPES OF SPREADING now, new & nud -– Methods of Fabric spreading – Spreading equipment – Computerized spreaders – Marker making –Marker efficiency – Factors affecting marker efficiency – Marker duplicating methods – Computer aided marker making.

UNIT II - Pattern Making & Cutting

Basic Pattern Making: Measurement Taking – Size chart and Measuring of Sizes, Definition of various garments parts & positions, Anthropometry – Process Of Standardizing The Sizes, Preparation of basic blocks, muslin pattern, commercial pattern, sizes and its understanding, , Spreading parameters, types of spreads, manual and automatic spreading. Introduction to Cutting Machines: Types and functions of cutting machines – straight knife, round knife, band knife, cutting machines – Notches, drills, die cutting machines – Computerized cutting machines –maintenance of cutting machines – common defects in cutting & their remedies.

UNIT III - Sewing Machine

Types of needles – Parts of needles and their function – Needle size - sewing thread – properties of sewing threads – ticket number – fabric sew ability . Seam quality – effect of stitch type on seam quality . Selection of seam and stitch. Federal classification of seam and stitches

Basic parts of sewing machine – Needle – Bobbin case /Bobbin hook, Loopers – Loop spreader – Threading fingers – Throat plate – Take-up devices – Tensioners – Feed dog – Pressure foot for sewing.

Sewing Technology: Feed systems, machinery and equipment, basic sewing machines, like general sewing, over locking, safety stitching, blind stitching, button holes, bar tacking, & button sewing, special sewing machines like three thread overlock with a microprocessor, Sewing problems, slipped stitches, staggered stitches, stitching pucker etc.

UNIT IV - Fusing & Pressing

Fusing Technology: Construction of Fusibles, Fusing process, Fusing machinery, quality control,

Pressing Technology: Classification, components of Pressing, machinery and equipment viz. Hand irons, dry iron, electric steam iron, under pressing, top pressing, scissors press, Carousel machines, Steam dolly, tunnel finishing, controls, handling systems, boiler room.

UNIT V - Trims & Production Technology

sSort note on buttons, zips, underlining, Hooks and ornamental materials, fly, kissing, lap; Button and buttonholes, hooks and eye snaps, Velcro and other accessories.

Garment Finishing and Inspection: Attaching buttons, marking, sewing labels, cleaning, final touch, fitting quality, live models, measurements, viewing the garments, quality standards.

Production Technology: Manual systems, making through, section system, progressive bundle system, straight line system, unit production system, quick response sewing system.

TEXT BOOKS:

IV Year B.Tech. Textile Technology I - Semester	L	T	P	To	C
	4	0	-	4	4

TT425 INDUSTRIAL ENGINEERING FOR TEXTILES & APPARELS

Course Description & Objectives:

This main objective of this course is to understand the set up of manufacturing unit and work practice to get better quality and higher production.

Course Outcomes:

At the completion of this course, the student should be able to

1. *Understand the different Concepts and meaning of industrial engineering*
2. *Understand Different techniques in designing a workstation at bulk production*
3. *Design a production system or work system by using different techniques in industrial engineering*
4. *Understand how to Perform Work study and method study*

UNIT I- Introduction

Introduction to Industrial Engineering: Nomenclature as Production & Operations Management, Need for Textile production, meaning, objectives, scope & its relevance to Textile Industry, Economical size of the firm, factors governing size, small scale industries - reasons for survival and optimum firm. Facilities planning: Product selection process and selection of a process, Project form. capacity planning-Def. measurement of capacity-process of capacity planning. Capacity Utilisation.

UNIT II - Plant Building And Location

Plant Building: Significance, considerations of building design, types of industrial building -Textile examples, Ideal building. Plant lighting: Need, types, factors governing, A brief note on Ventilation, Plant Location:Def., need, Factors governing, theories, selection of actual site, quantitative techniques, types of location like: Rural, sub-urban & Urban, merits &demerits - Examples from Textile field.

UNIT III - Plant Layout And Material Handling

Plant Layout and Material Handling: Def, need, objectives of Scientific layout, Principles of layout, Types of material flow, factors governing the layout , types of layouts, Merits and demerits, textile examples. Quantitative techniques for selection of plant layout.(brief note on QTM, Craft,Corelap) Principles of material handling – meaning &significance, types equipments for Textile production Value Engineering: Value and functions – types. Maintenance Management – Types – maintenance cost.

UNIT IV - Production System And Purchasing

Types of Production Systems: Flow line, batch and job shop – Planning and Control for mass production – characteristics – Design aspects – Problem of mass production – FMS – Batch production – EBQ. Supply Chain Management: concept & tools, make or buy & factors affecting out sourcing

Purchasing: Fundamentals, purchase procedure – types of purchases– purchase organization introduction to material management in production system; product organization role of material management, Inventory and stores management (Brief study of EOQ, ABC analysis).

UNIT V - Safety And Method Study

Organisation for Safety: Safety , significance, Accident s classified,causes of accidents costs of accidents, safe-t-score test, various approaches of accident prevention and recording. Introduction to Work study: step s in method study , tools of record, Time study-step s, elements, allowances, work measurement (Assessment of S M V for Apparel Product) Ergonomics - Noise control - Plant Humidification in Textile mills: working of humidification Units, RH% selection.

TT427 PRACTICAL ASPECTS OF TEXTILE AND APPAREL MANUFACTURING

Course Description & Objectives:

It is very essential for any student to understand various practical aspects of the textile field. This course will be helpful to the students in terms of understanding various important techniques and calculations required.

Course Outcomes:

From this course students would be able to

1. *Understand labor requirement for different departments.*
2. *Calculations for Spin Plan & Weaveplan*
3. *Learn different practical aspects in textile industry.*

UNIT I - Fiber Preparation For Spinning

Ginning : Planning for Ginning plant, space calculations, Labor requirement, Inventory planning and Transportation planning to Spinning Mills

Blow room :Requirements for preparation of lot size of Cotton, Calculation of lot size from Bales, planning of the settings in Blow room machines, Calculation of Individual and Overall Cleaning efficiency of Blow room, Waste calculation , Assessment of Productivity , Planning of Blow room lines with respect to the lot size prepared

Carding : Calculation of Number of Cards, Setting of zones for Cotton, Blends and Synthetics, replacement analysis of spares of Card , Labor allotment , Productivity in Cards

UNIT II - Spinning Preparatory & Spinning

Drawing : Calculation of Number of Draw frame passages, Setting of zones for Cotton, Blends and Synthetics, replacement analysis of spares , Labor allotment , Productivity.

Simplex: Desired Roving Hank by Adjustment of machinery elements, arrangement of cans for feed, Productivity assessment, Labor allotment , replacement of spares.

Ring Frame: Replacement of Cots, Aprons, Travellers, Spacers, planning for allotment of Ring frames with respect to count spun, Bonda waste assessment and control, Hank meter gain, adjustment of desired twist by changing twist change pinion.

Post spinning and Modern spinning : Calculation of space and labor, planning and inventory of spares, Waste estimation and planning for transport, estimation of water, air and electrical energy for all the spinning process.

UNIT III - Weaving Preparatory

Winding : Labor and Drums allotment based on count, Machines allotment for feed stock, Productivity and Waste control , Planning of Inventory of spares

Wapring: Optimum creel utilization, Number of Warper beams estimation and labor allotment, Planning for material transport, Planning of Inventory of Beams of different widths.

Sizing: Space estimation for Creel zone, Decision on Number of Sow box and Storage Becks to be used, Consumables and inventory planning of Sizing ingredients , beam press rollers, Dry splitting rollers, chain drives etc.,

Post Sizing operations: Planning of Inventory for Heald wires, Reeds, Drop wires, Weavers beams, accessories of drawing and denting operations

UNIT IV - Weaving

Loom Shed: Space planning and looms accommodation, Labor allotment , Planning for replacement of spares and Inventory planning and ABC analysis, calculation of water for weaving process , RH calculations , Elimination of wastes in weaving

Grey ware house: Space calculation, planning of labor, planning of transportation of cloth roll beams to wet processing area, spares planning and C class items.

Wet Processing: Calculation of labor for all the operations, Planning for spares and Inventory planning, Space planning, Water requirement and planning for wet processing house, estimation of Effluent for a dye and wet pro.

UNIT V - Apparel Manufacture

Inspection : Man power allocation for Grey fabric checking- 100% checking, Random checking.

Marker making- considerations, constraints for check and stripes- marker utilization Vs human factors- estimation of time for 1.5, 3, 6 and 12 meters marker plan.

Cutting : Man power allocation for cutting table for a given order quantity- cut plan- critical issues in cutting- improvement of productivity

Sewing : Capacity planning for sewing department- skill matrix development – problems with WIP- machinery planning for given order- man power allocation for sewing line -men to machine ratio- material handling- spare parts management- work aid for critical operations- productivity enhancement- line balancing.

Finishing: Plan for finishing department- man power allocation for thread sucking- trimming- checking- ironing- folding- poly bag- cartooning- problems in trimming and ironing

TEXT BOOKS

1. Process and Quality control in Textiles – ATIRA, 1998
2. "Quality Control in Spinning" – SITRA Publication

TT429 GARMENT MERCHANDISING (ELECTIVE - III)

Course Description & Objectives:

This Course Teaches The Students About Fundamental Concepts Of Garment Merchandising that includes the types of merchandings, product development, sampling procedures, procurement techniques, costing and various channels of sourcing.

Course Outcomes:

1. *Understanding the different roles and works fulfilled by merchandiser*
2. *Understanding the fashion merchandising principles*
3. *To learn different concepts in costing, sourcing, sampling.*

UNIT I - Introduction, Types Of Merchandising

Structure of Fashion Industry, Need of Merchandising, Different forms of merchandising -Export merchandising, merchandising in garment production, Marketing merchandisier, Sampling merchandiser, Product development merchandiser, planning merchandiser, Buying house merchandising, Retail Merchandising, , Visual merchandising, etc. Traits of merchandiser.

UNIT II - Product Development

Functions of Production merchandiser: Product development, Sampling, Costing, Planning (T&A Calendar) , Coordination, Sourcing.

Product development: product development stages, different types of samples, costing at sampling stage, Role of Production merchandiser in product development.

Communication: Backbone of merchandising, Modes of Communication. Brief note of virtual prototyping, EDI. Communication Tools off Fashion merchandiser: quality manual, Purchase order, Tech Pack. Color communication tools: Lab dip / yarn dip / knit down, Desk Loom, Print Strike Off, Thread Run, art work etc. techpack contents .

UNIT III - Coordination & Sampling

Coordination: internal coordination and external coordination. Internal Coordination with sampling, PPC, Sourcing, Quality, Pattern making / CAD, cutting, Production, Finishing and Packing, IE, Finance / Accounts. External coordination with sub vendors (printing / Washing / Embroidery), Third Party testing, Fabric and trim Suppliers, Freight forwarder and Buyer.

Sampling: Different types of samples. Brief note on different samples like Design development sample, proto sample, fit sample, AD or photo shoot sample, salesman sample, pre production sample, GPT sample, size set sample, TOP sample, wash sample, shipment sample. Assessment of sample.

UNIT IV - Costing

Costing: Components of cost of garment. Brief note on costing of fabric, trims, CMT, Value added services (print, embroidery, washing, appliqué), Garment testing, quality cost, transportation and logistics cost, profit fixing. Brief note on INCO terms like ex-factory, FOB, CIF and DDP.

UNIT V - Sourcing

Merchandising Sourcing : Material sourcing & buying, Different Sources, Domestic and International Sourcing :Advantages, Disadvantages, Buying Offices, Services offered by a Resident buyer, Buying Cycle, Vendor

Management: Vendor selecton & development Logistics and Transportation, Vendor, Partnership, causes and conflicts between retailer and vendor, process and factors involved in Fabric / trims sourcing. Lead time, logistics, Quality parameters,sourcing costs, MOQ. Types of Supplier: Nominated supplier, Non – Nominate dusppliers – advantages. Brief note on ordering specifications.

TEXT BOOKS:

1. Fashion Buying & Merchandising by Sydney Packard
2. Fashion Merchandising by Elain Stonepage

REFERENCE BOOKS:

1. Supply Chain Management by B.S. Sahay
2. Techniques for Merchandising Buying by M.S. Bohlinger
3. Articles by Vasant R.Kothari, NiFT in Bangladesh Textile Today.
4. Fashion Buying by Elain Stonepage

	4	0	-	4	4

TT 431 RETAILING AND BRANDING MANAGEMENT OF APPARELS (ELECTIVE - III)

Course Description & Objectives:

This Course Teaches The Students About Fundamental Concepts of retailing systems And Brand management techniques.

Course Outcomes:

1. *Understanding the different roles and works fulfilled by Retailers.*
2. *Understanding the different types of retailing systems, stores.*
3. *To learn different concepts in Branding and retailing.*

UNIT I - Basic Concepts Of Retailing

Introduction, retailing as a concept, importance, difference between retailing and wholesaling or other channels of distribution. Functions of retailers, main features of modern retail, concept of value chain in retail, retailing services.

UNIT II - Retailing Types

Types of retailers: Store based retail formats, Multi channel retail Formats, Ownership structure in Retail, Retail Mix, Retail Formats, Current Indian scenario in retail formats.
Store Location: Introduction , importance of location in retail.

UNIT III - Brands & Branding

Merchandising Procurement and store Brands: Introduction, Types of merchandise products, Product Range, Process of merchandise procurement, merchandise assortment plan, Store Brands. Category management : Introduction, Product category, Category management.
Pricing in Retailing: Importance of retail Pricing, Factors Affecting Pricing, Approaches adopted in Pricing of Products, Few guidelines of pricing.

UNIT IV - Visual Merchandising

Store layout, design and Visual Merchandising : Introduction, Store layout and design, Visual Merchandising. Promotional mix in retailing : introduction, need, strategies, elements planning and implementation. Introduction to Inventory management in retail, Supply chain management in retail, Customer Loyalty, CRM.

UNIT V - Brand Management

Branding : Introduction, Brand elements, Brands Vs Products, Online Brands, Branding Challenges and opportunities. Strategic brand management, Brand positioning, establishing Brand awareness, Brand building, Brand Communities, Brand elements Case studies on Raymond, WALMART, NIKE, ZARA etc

TEXT BOOKS:

1. Fundamentals of Retailing By K. V. S. Madaan, Tata McGraw Hill,
2. Strategic Brand Management: Building, Measuring, and Managing Brand Equity By Kevin Lane Keller, M. G. Parameswaran, Isaac Jacob, PEARSON

REFERENCE BOOKS:

1. Brand Management By Ranjeet Verma, University Science Press, New Delhi
2. Luxury Retail Management: How the World's Top Brands Provide Quality Product & Service support By Michel Chevalier, Michel Gutsatz, Wiley Publishers
3. Retailing Management (Special Indian Edition) By LEVY, Eighth edition, Tata McGraw Hill

IV Year B.Tech. Textile Technology I - Semester	L	T	P	To	C
	4	0	-	4	4

TT433 ENERGY AND POLLUTION CONTROL IN TEXTILES (ELECTIVE - III)

Course Description & Objectives:

This objective of course is to make aware the students about the pollution created by the production process. The other objective of the course is to know about the preventive measures of the pollution created by the production process.

Course Outcomes:

1. *Understanding of energy spent in textile.*
2. *Understanding the causes of pollution in textile industry.*
3. The energy and pollution control process will be taught.

UNIT I - Introduction

The nature of textiles: Textiles as engineering materials, Energy**,** Environmental impact of fibre production. Environmental impact of yarn production – Baling Transportation Opening Carding Spinning, Noise and dust. Environmental impact of fabric production – weaving, knitting and nonwovens, Coating and laminating, Film fibrillation.

UNIT II - Environment Responsibility

Toxicology of textile dyes: Introduction and Historical aspects**.**

Environmentally responsible dye application: Introduction, The influence of environment on the dyer's task,

Supercritical fluid textile dyeing technology: Introduction, Environmental compatibility of CO_2, Physicochemical properties of CO_2, Current environmentally sound applications of CO_2

Pollution abatement and waste minimization in textile dyeing: Introduction, Best management practices. Reducing pollution in textile dyeing, Recycling and reuse of dyestuffs and chemicals. Waste minimisation in textile dyeing.

UNIT III - Effluent Treatments

Reuse of spent dye bath –Use of spent dye bath through reconstitution, Use of spent dye bath through decomposition of dyes, Spent dye bath reuse techniques, The effect of residual components.

Chemical treatment of textile dye effluent: Introduction, Measurement of colour removal, Other measures of dye molecule fate. Chemical methods for colour removal and other processes. Biotechnological treatment of textile dye effluent: Introduction, Biotechnology and dye effluent treatment, Microbial processes, Enzymic processes

UNIT IV - Sustainability In Industry

Sustainability in industry: Tools for assessment and practice in industry, International organizations, Textile and apparel organizations, Sustainability for credit rating. Environmental management systems – International management systems: ISO 14000, Textile environmental management systems (EMS).

UNIT V - Disposal Techniques

Disposal, reuse and recycling scenarios, Strategic considerations and practices, The Swiss recycling system, Case studies: recycling PET and polyamide. Protection of, or by, textiles from environmental Damage.

TEXT BOOKS:

1. R M Christie, "Environmental_aspects_of_textile_dyeing", Woodhead Publishing Limited, 2011.
2. Slater, "Environmental impact of textiles: Production, processes and protection" Woodhead Publishing Limited, 2003.

TT435 STRUCTURE AND PROPERTIES OF YARNS & FABRICS (ELECTIVE - IV)

Course Description & Objectives:

This objective of course is to learn about structure property relationship of yarns and fabrics.

Course Outcomes:

1. *Students will able to relate basic parameters with final property and also its calculation.*
2. *They will also know the structure property relationship.*

UNIT I - IDEALISED HELICAL YARN GEOMETRY AND TWIST

Basic geometry of twisted yarn – The idealised helical yarn geometry – yarn count and twist factors – Limits of twists – Real and idealised yarns– Schwarz Constant - Twist contraction: – Contraction & retraction factor.

UNIT II - PACKING OF FIBERS

Packing of fibers – yarn idealised packing – concept of open and close packing – Deviations from ideal forms of packing – specific volume of yarns – Measurement of packing facts – yarn diameter concept as suggested by pierce Hamilton, Grosberg and Dickson.

UNIT III - FIBER MIGRATION AND STRAIN MECHANICS

Fiber migration – ideal migration – Tracer fibre technique –characteristics of migration – Strain mechanics: Strain in yarns – with and without lateral change – determination of twist angles before and after straining (simple numerical problems) – energy stored in fibre – blended yarn mechanics – Hambergers analysis.

UNIT IV - FABRIC GEOMETRY-I

Elements of fabric geometry – pierce cloth geometry – Problems on Pierce geometry model – Concept of Kemp's race track model and Olefin mechanistic model – Derivation of formula of Arial density of fabrics, Problems on fabric weight, cover factor and fabric cover – Pierce & Balls weight factor – Fabric quality index.

UNIT V - FABRIC GEOMETRY-II

Tensile properties of woven fabric – Geometrical changes during extension– the load extension modulus (without considering bending energy) – Geometry of plain knitted fabrics – Empirical dimensionless relation ships, Concept of Runners ratio, Structure ratio – Problems on dimensionless constants, Analysis of fabric shear.

TEXT BOOKS:

1. Hearle, Grosberg and Backer, "Structural Mechanics of Fibers, Yarns and Fabrics", Vol – I, Wiley – Inter-Science, New York, 1987.

TT437 TEXTILE POLYMER SCIENCE (ELECTIVE - IV)

Course Description & Objectives:

This objective of course is to learn about polymerization process. The other objective of this course is to know the properties and use of different polymers.

Course Outcomes:

1. *Students will able to understand the importance of polymer.*
2. *They will able to understand different polymerization technique, process chemistry and machine related to the process.*
3. *They will know the characterization of the polymers.*
4. *They will also learn the application of polymer blend and composites.*

UNIT I - Introduction And Types Of Polymerization

Introduction to polymers, Bonding in Polymers, Functionality, Polymerization mechanism & kinetics, chain-polymerization, Free-radical, anionic & cationic Co-ordination polymerizationm, Step polymerization, Poly-condensation, Mechanism of compensation polymerization, Ziegler natta catalysts, Mechanism of Polly - addition and ring opening polymerization chemical & geometric structures in polymers, growth of polymer industry in India.

UNIT II - Characterization And Molecular Weight

Molecular weights and their determination: Number average, weight average and viscosity average molecular weight, principles and calculation of the molecular weights by end group analysis, cryoscopy, Ebulliently osmometry light / scattering methods and viscometer methods, molecular weight distribution, Gel Permeation chromatography, Polymer Morphology and crystallization, Transition in polymers, Thermodynamics of polymer solutions, solubility parameter and its determination, Flory Huggins theory.

UNIT III - Blend And Special Polymer

Polymer Blends and alloys, Definitions, Phase diagrams, Reasons for blending, Types of blends, Compatibilization, methods of blending, Technoeconomical consideration for blending, Interpenetrating networks, Polymer rheology recent application of polymers, Electro-active polymers & Biomedical applications.

UNIT IV - Polymerization Techniques

Polymerization Techniques (mechanism, merits demerits along with examples of manufacture of polymers), Bulk Polymerization - PET& PBT manufacture, solution polymerization - Poly propylene manufacture, suspension polymerization, PS & PMMA, Emulsion polymerization, SBR; Processing of polymers: Compounding, extrusion, Injection molding, rotational molding, compression molding, blow extension and extrusion blow molding.

UNIT V - Polymer Composites

Polymer composites: Introduction, applications, constituent materials, details of matrices (polymers) Polymer resins, epoxy resins, vinyl ester resins ,silicone resins, structural aspects influencing properties (Intramer, Intro molecular Inter molecular structure) – Reinforcement – glass fibres, general performance, characteristics, fibre production glass compositions, forms of commercial fibres, carbon and carbon firbes: production & properties, Aramid fibres, production & properties, manufacturing techniques of composite materials, hand layup process, bag moulding process, matoned die moulding, filament winding, pultrusion, perpregs and moulding compounds, introduction to polymer nano composites.

TEXT BOOKS:

1. P. Ghosh, "Polymer Science & Technology",Tata McGraw Hill Publishing, New Delhi (2002).
2. B.T. Astron, "Manufacturing of Polymer Composites", Chapman & Hall (1997).

TT439 MAINTENANCE OF TEXTILE MACHINES (ELECTIVE - IV)

Course Description & Objectives:

This course deals with the maintenance of textile machines includes Spinning, Weaving and processing etc. are to be covered.

Course Outcomes:

1. To learn maintenance of various machines in textile industries.
2. To learn significance of machine maintenance with proper schedule.

UNIT I - Introduction to maintenance

Maintenance: Meaning, need concept, importance, objectives of maintenance, Types of Maintenance: Breakdown & planned maintenance sub classification of planned maintenance, Procedure for planning, schedules for preventive maintenance.

House Keeping: Meaning, Need, scope, Types and Equipment available today and cost of maintenance, Type of Hose keeping required from fibre processing to Garment production in Textile & Apparel Industry- Requirements of Export houses with respect to House-keeping – I S O recommendations for House-keeping -Impact on the Psychological aspects of worker and intern effect on Production, Precautions to be taken while spinning too trashy cottons, Dust prone sections in Spinning.

UNIT II - Maintenance of Spinning Preparatory Machines

Machine Schedules, staff, precautions & methods to be followed during maintenance activities, tools & gauges used for maintenance.

UNIT III - Maintenance of Ring frame & other spinning machines

Maintenance of Ring frame & Compact Spinning Mechanisms: Schedules, staff, precautions & methods to be followed, Tools & gauges used, Maintenance of Rotor Spinning Machines, Schedules, Precautions, Methods etc., Study of aprons & cots used in spinning & their maintenance.

UNIT IV - SQC & Lubrication

SQC Synchronization with Maintenance: SQC activities useful for maintenance in various departments of spinning, Basic concept of lubrication, types of lubricants used for textile machines, Lubricant storage handling, precautions, Maintenance of weaving preparatory machines, schedules, critical points of maintenance, precautions to be taken during maintenance operations.

UNIT V - Maintenance of Plain & Auto Loom and Machine audits

Maintenance of Plain & Auto Loom: Schedules, critical points, precautions, auditing of plain & auto loom.

Maintenance of Shuttle-less Weaving Machines: Approach towards maintenance of latest weaving machines, Critical maintenance points of various shuttle-less weaving machines, Recording of maintenance activities & its importance.

Machine Audit: Concept and auditing of all Textile and Apparel machines, Energy conservation Textiles & Apparels.

TEXT BOOK:

1. BTRA, "Maintenance Manuals for Various Spinning & Weaving Machines", 2nd ed., 1990.
2. Machine Maintenance manuals from LMW

TT 441 APPAREL PRODUCTION TECHNOLOGY LAB

Course Description & Objectives:

This Course GIVES hands on experience on the cutting & sewing machine handling and also students will get better understanding of application od different seams and stitches

Course Outcomes:

At the completion of this course, the student should be able to

1. *Understand the different parts in a sewing machine*
2. *To perform different types of seams and stitches*
3. *To perform cutting of fabric*
4. *To perform sewing of fabrics*

LIST OF EXPERIMENTS

1. To understand different parts in sewing machine.
2. Study of straight knife and round knife cutting machine.
3. Study of single needle lockstitch machine and adjustment of major parts.
4. To perform stitching in different shapes used in training of the sewing operators
5. To study different types of Seams.
6. To stitch the fabric with different types of seams.
7. Cutting the fabric with the help of patterns drafted.
8. To perform fusing operation to garment parts like collars and cuffs.
9. To prepare the different parts of the garment with sewing.
10. To assemble the different parts of the garment.
11. To analyse the garments for quality inspection.
12. To analyse the garment defects and suggest the improvements in prepared garments.

IV Year B.Tech. Textile Technology - I - Semester	L	T	P	To	C
	-	-	3	3	2

TT 443 PATTERN MAKING LAB

Course Description & Objectives:

This Course provide practical knowledge / hands on experience in preparing patterns for some of the classic garments like shirt, trouser etc.

Course Outcomes:

At the completion of this course, the student should be able to

1. *Understand the different concepts in pattern making*
2. *To perform pattern making for different types of garments.*
3. *To plan the operation bulletin and calculate the SAM*
4. *To perform cutting of fabric*
5. *To perform sewing of fabrics*

LIST OF EXPERIMENTS

1. Drafting the pattern for five piece basic set consisting of basic block, basic shirt with sleeve.
2. Calculate the marker efficiency of a shirt and minimize the fabric consumption with the help of mini marker.
3. Development of the pattern for a basic block using CAD system.
4. Development of design, pattern and marker plan for men's formal shirt using CAD system.
5. Preparation of a marker plan and calculate the marker efficiency for the men's shirt on CAD system.
6. Preparation of an operation bulletin for a garment and suggest the number of machines required, number of operators required and SAM of the garment.
7. To prepare pattern for a childrens garment
8. To prepare patterns for a mens / womens trouser
9. To prepare patterns for women's top.
10. To prepare production patterns for a mens shirt with signle pocket.

IV Year B.Tech. Textile Technology - I - Semester	**L**	**T**	**P**	**To**	**C**
	-	**-**	**3**	**3**	**2**

TT 445 INDUSTRIAL ENGINEERING LAB

Course Description & Objectives:

This Course provide practical knowledge to improve the production by only work practice with the same resources.

Course Outcomes:

1. *At the completion of this course, the student should be able to Perform work study*
2. *Able to Calculate SAM*
3. *Able to Calculate SMV*

LIST OF EXPERIMENTS

1. To study the terminology and process of work study
2. To perform method study
3. To perform RH LH chart of one sewing operation
4. To perform time study
5. To calculate SMV by Work Study
6. To analyse one operation and to give suggest new method and calculate savings in tine.
7. To study different types of charts used in method study
8. To study different types of charts used in Time Study
9. To study various types of elements and perform a small operation into elements.
10. To study concepts in calculation of SAM

IV Year B.Tech. Textile Technology II - Semester

L	T	P	To	C
4	0	-	4	4

TT414 HIGH PERFORMANCE FIBERS (ELECTIVE - V)

Course Description & Objectives:

This objective of this course is to provide thorough knowledge about high end use fibre. The manufacturing process and properties of those fibres has also to be taught.

Course Outcomes:

Students will able to understand the importance of high performances fibre.

1. *They will able to understand importance of preparation technique, process chemistry and machine related to the process.*
2. *They will know the characterization of those fibres.*
3. *They will also learn the application of high performances fibre.*

UNIT I - Introduction

Introduction to fibres for high performance fibres; Polymerization, spinning and properties of aromatic polyamides, high molecular weight polyester, rigid rod and ladder polymers such as BBL, PBZT, PBO, PBI; Manufacturing of carbon fibres from PAN precursors, viscose and pitch fibres.

UNIT II - Glass Fibres

Glass fibres; Liquid crystal fibres; Gel spinning of polyethylene; Hollow and profile fibres, design of spinnerette for such fibres; Membrane technology; Blended and bicomponent fibres.

UNIT III - Aromatic Polyamides And Carbon Fibres

Production and properties of aromatic polyamides & polyesters, Rigid rod and ladder polymers such as Kevlar, Nomex, BBL, PBZT, PBO, PBI, Manufacturing of carbon fibres from PAN precursors, viscose and pitch fibres.

UNIT IV - Liquid Crystal Fibres

Liquid crystal fibres, High performance polyethylene fibres, Ceramic fibres, Definition of composites, Resins for composites, Fibre architecture- short and long, Interfaces, Composite theory, Fabrication of composite materials, Case studies on composites.

UNIT V - Fibre Architectures

Different fibre architectures used for composites and their characteristics and properties; Influence of fibre architectures on the properties of composites; Unidirectional, planar, 3D and net-shaped performing; Introduction to matrix types and their properties, Polymeric matrices for rigid and flexible composites;

TEXT BOOKS:

1. J. Hearle , "High-Performance Fibres, 1st Edition", Woodhead Publishing, 26 Oct (2001).
2. B.T. Astron, "Manufacturing of Polymer Composites", Chapman & Hall (1997).

REFERENCE BOOKS:

IV Year B.Tech. Textile Technology II - Semester

L	T	P	To	C
4	0	-	4	4

TT 416 FUNCTIONAL AND MEDICAL TEXTILES (ELECTIVE - V)

Course Description & Objectives:

This objective of this course is to provide thorough knowledge about functional clothing of the functional property of the textile materials. Other objective of the course is to provide knowledge about smart and medical textiles.

Course Outcomes:

Students will able to understand the functional & protective clothing.

1. *They will able to understand the smart material and clothing .*
2. *They will know the importance of medical textile and thorough knowledge about medical textile.*
3. *They will also learn the artificial organs.*

UNIT I - Introduction

Introduction to and classification of Functional clothing envelopes: definition and terminology, Principles of Ergonomics and Human factors engineering: their application in design of functional clothing envelopes, Principles and practice of Anthropometrics, Biomechanical considerations in design of envelopes for specific applications, Comfort in 3D assemblies, testing and analysis of existing functional envelopes with a view to study specific design and manufacturing considerations.

UNIT II - Protective Clothing And Sportswear

Protective clothing: Clothing requirements for thermal protection, ballistic protection, UV-protection, protection from electro-magnetic radiation and static hazards, protection against micro-organisms, chemicals and pesticides. Design principles and evaluation of protective clothing;

Sportswear: Clothing requirements for different sports. Development of highly functional fibres, yarns and fabrics for temperature control and moisture management; Stretch, bulky and light weight fabrics.

UNIT III - Smart And Intelligent Textiles

Definition of smart and intelligent textiles; Passive and active functionality; Textile with high protection and comfort properties; Extreme winter clothing with low heat transmission, heat absorbing, heat storing systems; Phase change materials, incorporation of PCMs in fibres and fabrics; Breathable textile; Multifunctional textiles with incorporated electronics for integrated communication, music, health monitoring, defence support functions, wearable computers.

UNIT IV - Medical Textiles

Medical textiles; Healthcare and hygiene products: Surgical Gowns, masks, wipes, Antibacterial Textiles, Super absorbent polymers, Superabsorbent fibres, Safety, Legal and ethical issues involved in the medical textile materials; Plasma modification; Radiation processing; Polymers and Textile-based techniques used for medical applications.

UNIT V - Artifical Body Parts

Cell-Polymer interaction, Non-implantable materials: Wound-dressing, related hydrogel and composite products, Bandages, Gauges, Implantable biomedical devices: Vascular grafts, Sutures, Heart valves, Extra-corporeal materials: Scaffolds for Tissue engineering, Rapid prototyping, Cartilages, Liver, Blood Vessel, Kidney, Urinary bladder, Tendons, Ligaments, Cornea.

TEXT BOOKS:

TT418 COMPUTER APPLICATIONS IN TEXTILES (ELECTIVE - V)

Course Description & Objectives:

This objective of this course is to learn various applications of computes in textile industries.

Course Outcomes:

At the completion of this course, the student should be able to

1. *Understand the different applications of computers in different process of textile and apparel manufacturing.*
2. *Able to understand the need of CAM, CAD in textile manufacturing*

UNIT I - Introduction & CAD

Introduction to Computers: Types, selection, memory devices, Computer technology, programming languages, microcomputers and programmable controllers.

Computer Aided Design: Fundamentals of CAD, Hardware in CAD, Computer Graphics, Computer Aided Process Planning

Computer Integrated Manufacture: Scope and Application to Textiles

Application of Computers in Man Made Fibre Manufacture:

Introduction to computrisation of Textile production and need – Broad applications of computers in Textile production - Selection of monomers in planning of production mix for synthetic fibre manufacture using computes – computers in Melt, Solution and Gel Spinning of man made fibres – Techno-economics of computerization – Role of IT in fibre manufacture.

UNIT II - Applications In Spinning

Application of Computers in Spinning: Selection of cotton and different fibres in yarn manufacture using LPP through computers – applications of user friendly devises in Carding, Comber, Drawframe, Simplex, Ring Frame & Rotor spinning- Modeling of yarn structure thro' computers- Spin plans for different lot size and fir different fibres (100% and Blends)- Data bases for calculation of cost /kg of yarn, raw cotton cost and clean cotton cost - Role of IT in Spinning.

UNIT III - Applications In Weaving And Testing

Application of Computers in Weaving & Testing: Use of computers in weave plan, Development of Woven fabric designs through CAD for Dobby and Jacquard designs, Development of Stripes and checks thro' colour pallet, Use of computer in understanding colour and weave effect, application of computers in understanding the historical ornamentations of India and other countries – Use of computers in Testing instruments like Computarised count, strength, etc., properties measurement – Role of IT in Weaving and Testing

UNIT IV - Applications In Chemical Processing And Garments

Application of Computers in Chemical Processing, Garmenting & Production Management: Computer aided textile printing, texture mapping and garments structure designing CAD, CAD in Garment Industry, CAD in Fashion Design, Internet and Intranet (Brief note), information technology in Hosiery Manufacture -Computer applications in textiles – Inventory control Maintenance – scheduling – production and efficiency – Management reporting power, fuel consumption analysis, Applications of computers in SQC, Financial analysis – Evaluation and monitoring the through computers.

UNIT V - ERP

Introduction of ERP: Evolution of ERP, growth of ERP, Need for system interaction and interface, early ERP packages, various models of ERP, advantages of ERP, Overview of enterprise, integrated management, business modeling ERP for small business, business process for ERP module design, opportunities and problems in ERP selection and implementation, hardware Environment.

TEXT BOOKS:

TT420 TEXTILES IN SPORTS AND AUTOMOBILES (ELETIVE - VI)

Course Description & Objectives:

This objective of this course is to provide thorough knowledge about the manufacturing and properties of textiles used for sports and automobiles.

Course Outcomes:

- *Understanding of trends in sportswear design and material requirement.*
- *Application of coated and elastic textiles in sportswear and designing of breathable fabric.*
- *Selection and design of textiles materials for different automobiles part depending upon end use.*

UNIT I – Introduction to Key trends in Sportswear Design

Introduction, Market overview, Future market trends, the evolution of performance underwear; the rise of all-in-one suits; The evolution of layering: the reorganization of the three-layer system; the soft shell; air: a key raw material, External influences: interactions between fashion and sportswear; wearable technology, Future trends: streamlining or stealth design.

Material requirements for the design performance of sportswear

Developments in sport specific clothing from post war to the present day: the layering system; from walking to mountaineering; point of sale promotional material; synthetic fibres and fabrics.

UNIT II - Laminated And Elastic Textiles

Coated and laminated textiles in sportswear: Introduction, Sports products from coated and laminated fabrics: protective sportswear and comfort; other sports products Base fabrics and fabric preparation.

Elastic textiles: Manufacturing of Elastic textiles for sportswear, Stretch fabrics, Breathable stretch, Breathable waterproof stretch.

UNIT III - Water Resistance And Water Vapour Transfer

Introduction, Water resistance, Water vapor transfer: performance and protection under steady state conditions; performance and protection under windy conditions; performance and protection under rainy conditions; performance and protection under wind driven rainy conditions, The condensation problem in waterproof breathable fabrics for sportswear. Performance of clothing for cold protection. Textile composites in sports products.

UNIT IV - Quality Testing

Quality assurance and testing for Automotive textiles: Quality assurance, Test method details, Product engineering – interior trim, Introduction, Seats, Materials for seat making, seat comfort, Headliners, Door casings, Parcel shelves, other interior trim, complete modular interiors.

UNIT V - Various Applications

Introduction , Seat belts, Airbags, Carpets, Cabin air filters, Battery separators, Bonnet (hood) liners Wheel arch liners, Hood material for convertibles, Tyres, Hoses and belts – general considerations.**Textiles in other road vehicles:** Railway applications, Marine applications, Textiles in aircraft.

TEXT BOOKS:

TT 422 TEXTILES COSTING AND FINANCIAL ANALYSIS (ELECTIVE - VI)

Course Description & Objectives:

This course deals with textile costing and financial analysis i.e. planning and preparation of textile projects.

Course Outcomes:

1. *To prepare project their own if they like to be as an entrepreneur.*
2. *To know, learn how to implement a new project with financial analysis and risk analysis to overcome all and taking the project as successful.*

UNIT I - Introduction

Overview – Capital expenditure, Phase of capital budgeting, Project development cycle, Objectives of investment, decision-making, Risk & return. Definition of Economics – Nature and Scope of Economics, Market & demand analysis – Information required for market & demand analysis – demand forecasting methods – market planning.

UNIT II - Ideas & Technical analysis

Identification of investment opportunities, Generation & screening of project ideas, Project identifications for an existing company, Technical Analysis – Material inputs & utilities – Manufacturing process / technology – Plant capacity – location & site – structures & civil works – Machineries & equipments – Project charts & layouts – Work schedule –Need for tendering alternatives.

UNIT III - Financial analysis

Financial Analysis, Cost of Project, Means of finance, Estimation of Sales & Production, Cost of production, Working capital requirement & financing, Profitability projections, Break-even point, Project cost flow statements, Projected balance sheet – Multi – year projection. Time value of money, Future value of single amount, Future value of an annuity.

UNIT IV - Cost management & appraisal

Cost Management - An overview: Definition of Cost Management – Basic concepts, Traditional Cost Accounting and Cost Management. cost of Equity Capital – Weighted average cost of capital – Marginal cost of capital-Cost of capital for a new company. Appraisal criteria, Urgency, Payback period, Accounting, Debt service coverage ratio, Rate of Return, Net present value, Internal rate of return, Annual capital charge, Investment appraisal in practice.

UNIT V - Risk Analysis

Risk analysis, Types & measurement of project risk, Analytical derivation or simple estimation, Sensitivity Analysis, Selection of a project. Project implementation, forms of project organization, project planning, project control, human aspects of project management, pre-requisites for successful project implementation.

TEXT BOOKS

1. Project, Planning Analysis, Selection Implementation & Review by Prasanna Chandra, Tata McGraw Hill Publishing Co. Ltd.,
2. Industrial Organisation & Engg. Economics T.R. Banga & S.C. Sharma, Khanna Publishers, Delhi.

IV Year B.Tech. Textile Technology II - Semester	L	T	P	To	C
	4	0	-	4	4

TT424 HOME TEXTILES (ELECTIVE - VI)

Course Description & Objectives:

This course deals with textile costing and financial analysis i.e. planning and preparation of textile projects.

Course Outcomes:

1. *To learn about different products and their specifications of home textile products.*
2. *To learn how these products can be manufactured.*

UNIT I - Introduction

Textile for Seating: Upholstery fabrics for domestic applications – scope, fixed upholstery, non-stretch loose covers, stretch covers, Upholstery fabrics for contract use – general, automotive applications, Commercial applications. Window Textiles: Sun filters (Sheers and nets), Semi-sheers, Reflective textiles, curtain fabrics & drapes, Blinds.

UNIT II - Bed Textiles And Towels

Bed Textiles: Sheets & Pillow Cases, Quilted Textile, Blankets & Rugs - Jacquard blankets, Printed blankets, Fire proof blankets, Baby blankets, Bed Spreads, Mattress covers (Ticking).

Towels: Types of towels, Bath robes, Beech Towels, Kitchen Towels, Terry towels, Napkins - Construction, weave, pile height, patterning, production, dyeing, finishing, etc.

UNIT III - Textile Art And Accessories

Fabrics for Wall Covering, Textile Art: Tapestries, Wall hangings, Textiles for screens & Room Dividers. Bathroom Textiles: General shower curtains, Terry Toweling.

Accessories: Scatter Cushions, Floor Cushions, Lampshade fabrics. Table Textiles: Tablecloths – Colour – Woven & Printed type, jacquard types, embroidered types, non-woven types. Table mats – Colour -woven, Printed jacquard, embroidered.

UNIT IV - Floor Coverings

Textile Floor Coverings: Introduction, Pile Fibres, Backing fibres & fabrics, Tufted carpets, Needle felt backings, woven carpet, Woven Carpet Manufacture, Wilton weaving, shedding mechanism, Aximinster, Tufted Carpet Manufacture, Broadloom machinery, Hand tufting, Ancillary equipments Needle felt Manufacture, Needling machinery, textured & patterned needle felts, thermo-bonded products, Unconventional methods for making carpets, Bonding, knitted carpet, stitch bonding, flocking.

UNIT V - Velour

Velour: Types of velvets – Jacquard, Dobby, Plain, Printed – Manufacture & construction, Methods of velour making by cutting and shearing. Kitchen

Textiles: Aprons, Dish cloth, Teacosy, Bread bag, Mittens, Pot Holders, Table Mats, Construction & manufacturing details.

General: Hand / machine embroidered scarves, stoles, shawls, Made-ups used in hospitals, etc., Textiles care labeling & Design aids.

TEXT BOOKS:

16HS103 ENGINEERING MATHEMATICS - I

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

It is aimed to offer various analytical as well as numerical methods to solve first and second order ordinary differential equations; to impart the knowledge of partial differentiation; to acquaint with the various methods to solve first and second order partial differential equations; to make the student familiar with applications of first order ordinary differential equations. To make the student to use different mathematical tools of Matlab related to above concepts.

Course Outcomes:

The student will be able to:

- recognise and solve different types of first order ordinary differential equations.
- find the complementary functions and particular integral of second and higher order ordinary differential equations with constant coefficients.
- apply the knowledge of ordinary differential equations in some instances.
- solve ordinary differential equations, with initial conditions, numerically.
- find the local maxima/minima of given function of two variables.
- eliminate arbitrary constants/functions from given relations to form partial differential equations.
- solve linear and non-linear partial differential equations of standard types.
- classify second order partial differential equations and solve them.

SKILLS:

✓ *Solve given differential equation by suitable method.*

✓ *Compute numerical solutions of differential equation by apt method.*

✓ *Compute maxima/minima of given function.*

✓ *Solve given partial differential equation by appropriate method.*

ACTIVITIES:

- *Estimation of acoustic impedance of a given material.*
- *Differentiate methods to solve given differential equation.*
- *Compute numerical solutions to differential equation and compare the result with Matlab output*
- *Compute maxima/minima of given function.*
- *Differentiate methods to solve given partial differential equation.*

UNIT - I **L- 9**

FIRST ORDER DIFFERENTIAL EQUATIONS : Variable separable, homogeneous differential equations, Linear differential equations, Bernoulli's differential equations, Exact and non-exact differential equations.

UNIT - II **L- 9**

SECOND ORDER DIFFERENTIAL EQUATIONS : Linear differential equations with constant coefficients, Homogeneous differential equations of second and higher order, Methods to find particular integral when RHS is of the form : eax, sinax, cosax and xn.

UNIT - III **L- 9**

APPLICATIONS OF FIRST ORDER DIFFERENTIAL EQUATIONS : Orthogonal trajectories (including polar form), Newton's law of cooling, Law of natural growth and decay.

NUMERICAL METHODS TO SOLVE DIFFERENTIAL EQUATIONS : Taylor series method, Picard's method, Euler's and modified Euler's method, Runge-Kutta method.

UNIT - IV **L- 9**

MAXIMA/MINIMA OF FUNCTIONS OF TWO VARIABLES : Review of partial differentiation: Partial derivatives, Partial derivatives of higher order, Homogeneous function, Euler's theorem, Total differential coefficient. Maxima and Minima of a function of two variables, Conditions for extreme values, Lagrange method of undetermined multipliers.

JACOBIANS : Definition, Properties, Jacobian of implicit functions

UNIT - V **L- 9**

PARTIAL DIFFERENTIAL EQUATIONS : Formation of Partial Differential Equations, Linear (Lagrange) Equations, Method of multipliers, Non-linear partial differential equations (Types), Charpit's method.

Second order linear equations with constant coefficients only, classifications, rules to find complimentary function and particular integral (special cases).

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Basic mathematical operations using Mat Lab
2. Solving simple expressions
3. Limits
4. Continuity
5. Symbolic differentiation
6. Symbolic integration
7. Plotting of curves
8. Plotting of surfaces
9. Maxima & minima of functions of one variable
10. Maxima & minima of functions of two variable
11. Solving first order O D E
12. Euler's Method and RK Method

TEXT BOOKS:

1. H. K. Dass and Er. Rajanish Verma, "Higher Engineering Mathematics", 3rd revised edition, S. Chand & Co., 2014
2. B. S. Grewal, "Higher Engineering Mathematics", Khanna Publishers, 44th edition, 2014
3. Rudra Pratap, "Getting started with MatLab", Oxford University Publication, 2009.

REFERENCE BOOKS:

1. Srimanta Pal and Subodh C. Bhunia, "Engineering Mathematics", Oxford Publications, 2015
2. B. V. Ramana, "Advanced Engineering Mathematics", McGraw Hill Education, 25th reprint, 2015.

16HS102 ENGINEERING PHYSICS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	45	30	10	-	10

Course Description and Objectives:

Technology is the experimental information for the physicist, where the theories can be tested. Recent technical developments have been the results of collaboration of physicists and engineers.

Study of engineering physics is a unique opportunity to learn the fundamental concepts of physics and apply this knowledge to both scientific and engineering problems.

The present course deals with various fields such as Lasers, Optical fibres, Photonics, Nano and funcational materials, make the students to enrich basic knowledge in various fields of physics and aply the same in engineering fields.

Course Outcomes:

The student will be able to :

- understand the applications of ultrasonics and to calculate the velocity of ultrasonic waves in liquids.
- acquire basic knowledge in Non-destructive techniques.
- understand basic concepts of laser and optical fibre which help in designing and developing new devices in emerging fields.
- grasp the basics of quantum mechanics.
- understand the fabrication of solar devices.
- use nano science and technology for innovative and compact design.
- demonstrate synthesis, properties and applications of nanomaterials and functional materials.

SKILLS:

- ✓ *Determine the velocity of ultrasonics in a given liquid using interferometer.*
- ✓ *Study the wavelengths of light sources and lasers.*
- ✓ *Estimate the efficiency of a given solar cell.*
- ✓ *Learn about the type of the optical fibre and their ability to propagate light waves from its numerical aperture.*
- ✓ *Know voltage – current characteristics of a given light emitting diode.*

UNIT - I **L- 9**

ULTRASONICS : Introduction – production of ultrasonic waves – piezoelectric method – Properties of ultrasonic waves – Types of ultrasonic waves – Determination of Velocity of ultrasonic waves in solids and liquids – SONAR - Medical Applications.

NDT: Introduction - Types-visual inspection-liquid penetrate testing – Ultrasonic Testing Systems – X - Ray Radiography.

UNIT - II **L- 9**

LASERS : Characteristics of Laser light – Spontaneous and Stimulated emission of radiation – He-Ne Laser – CO_2 Laser – Semiconductor laser - Applications.

HOLOGRAPHY: Holography and Applications.

FIBER OPTICS : Principle of optical fibre – Acceptance angle – Numerical Aperture – Types of fibres – Dispersion and Attenuation in optical fibres – Optical fibre communication system - Fibre Optic sensors.

UNIT - III **L- 9**

QUANTUM MECHANICS : Introduction- Matter waves - Schroedinger's time independent wave equation - Physical significance of the wave function - Particle in one dimensional potential well – Tunneling phenomenon.

FREE ELECTRON THEORY OF METALS : Introduction – Classical free electron theory – Electrical conductivity of metal – Quantum free electron theory - Fermi - Dirac distribution function and its variation with temperature

PARTICLE ACCELERATORS: Introduction- Cyclotron, Synchrocyclotron, Betatron and applications.

UNIT - IV **L- 9**

SOLAR ENERGY: Solar radiation – Photovoltaic effect – solar cells – Efficiency of solar cell – Solar thermal energy conversion systems.

PHOTONICS: LED – LCD – Photo conducting materials – photo detectors – photonic crystals - non-linear optical behaviour of materials - applications.

UNIT - V **L- 9**

NANO MATERIALS: Introduction – Fabrication of nano materials – Ball milling - Sol-Gel – Physical and Chemical properties of nano materials – Applications.

FUNCTIONAL MATERIALS: Smart materials – shape memory alloys – chromic materials (Thermo, Photo and electro) – Metallic glasses – Advanced ceramics – composites, Fiber reinforced plastics / metals – biomaterials.

TEXT BOOKS:

1. V.Rajendran, *"Engineering Physics"*, 7th edition, TMH Publications, 2014
2. D.K. Bhattacharya and Poonam Tandon, *"Engineering Physics"*, Oxford University Press, 2015/

REFERENCE BOOKS :

1. M.R. Srinivasan, "Engineering Physics", 1st edition, New Age International Publishers, 2008.
2. M.N. Avadhanulu & P.G. Kshirsagar, "Engineering Physics", 1st edition, Chand & Company Ltd, 1992.
3. Sukhatme S.P, "Solar Energy", 2nd edition, TMH publication, 2005.
4. Dr. Arumugam "Materials Science", 3rd edition, Anuradha Publications 2002.

ACTIVITIES:

- *Estimation of acoustic impedance of a given material.*
- *Measurement of distances using ultrasonic range finder.*
- *Study of linear density of yarn/ fibre using Melde's experiment.*
- *Determination of refractive index of a given liquid using laser.*
- *Finding height of a room using laser.*
- *Identifying the type of semi-conductor using Hall effect.*
- *Study of numerical aperture of optical fibres made of different materials.*
- *Design of solar panel to obtain required voltage.*
- *Evaluation of thermal conductivity of materials .*
- *Measuring temperature using thermo couple.*

16HS105 TECHNICAL ENGLISH COMMUNICATION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	15	5	6	4	5

Course Description and Objectives :

To introduce students the specific use of English for the purpose of Technical Communication that would strengthen their skills in the areas of writing and speaking and thereby enable them to function effectively in their professional sphere. The teaching efforts in this course will be directed towards making students develop their technical writing skills in particular and overall language proficiency in general. It will be done by making students peruse good samples of technical writing covering a wide range of contemporary issues relevant to the engineering profession. Students will, also be revisiting, the fundamentals of grammar to get trained on use of standard English.

Course Outcomes:

The student will be able to :

- acquire an understanding of the rules of grammar
- strengthen their reading and listening comprehension skills to follow the academic discourse in the engineering classroom
- have a command of basic vocabulary related to different subject areas
- have a grasp on the mechanics of writing and express their ideas through construction of simple texts
- attain language proficiency to participate in the classroom discussions

SKILLS:

- ✓ *Apply different sub skills like skimming, scanning, reading for information, reading for inference etc to understand different kinds of text*
- ✓ *Apply different sub skills like top down, bottoms up approachs to listening, and understand phonetic and phonological features of the English language to deconstruct long spoken discourses*
- ✓ *Use functional vocabulary relevant to subject areas like environment, tourism, engineering, technology and media to express ideas lucidly*
- ✓ *Use appropriate sentence structure, cohesive devices and diction to construct simple text in writing and regular correspondence like e-mails, letters etc.*
- ✓ *Capture and understand key points during class room discourses through applying sub skills of writing like note-making, paraphrasing and summarizing.*

UNIT - I **L-9**

- Text : **Environmental Consciousness**
  (Climate Change – Green Cover – Pollution - Renewable vs. Non renewable energy sources (from Energy Unit)
- Grammar : Articles – Prepositions – Sentence Types and Construction
- Vocabulary : Root – Prefixes - Suffixes
- Composition : Paragraph Writing (Descriptive and Narrative)
- Laboratory Practice : Introduction to Phonetics
  (Organs of Speech; Consonants, Vowels & Diphthongs; Syllable, Stress and Intonation)

UNIT - II **L-9**

- Text : **Emerging Technologies**
  (Solar Power – Cloud Computing – Nanotechnology- Wind energy (to be covered from Energy unit))
- Grammar : Time and Tense (Present-Past-Future; Helping Verbs; Modals)
- Vocabulary : Synonyms – Antonyms
- Composition : Letter Writing (Informal)
- Laboratory Practice : Grammar Practice (Speaking of past, present and future)

UNIT - III **L-9**

- Text : **Travel and Tourism**
  (Advantages and Disadvantages of Travel-Tourism – Atithi Devo bhava – Tourism in India)
- Grammar : Subject-Verb Agreement - Sentence Construction
- Vocabulary : Idioms & Phrases
- Composition : Letter Writing (Formal)
- Laboratory Practice : Situational Conversations – Role-Plays
  (Introducing; Greeting; Enquiring; Informing; Requesting; Inviting)

UNIT - IV **L-9**

- Text : **Engineering Ethics**
  (Challenger Disaster – Biotechnology – Genetic Engineering – Protection from Natural Calamities- How pertinent is the nuclear option? An Environment of Energy (from Energy unit))
  Avoiding sexist language (Gender Sensitization)
- Grammar : Sentence Transformation (Degrees, Voice, Speech & Synthesis)
- Vocabulary : Phrasal Verbs

  Composition : Note-making – Text - Nandan Nilekani's In search of our energy solutions (from Energy Unit)
  Summarizing, Text on "Flight from conversation" (New York Times)
- Laboratory Practice : Situational Conversations – Role-Plays (Emotions; Directions; Descriptions; Agreements; Refusals; Suggestions)

ACTIVITIES:

- *Doing phonetic transcription of selected words from the list provided using talking dictionaries of AHD & CALD.*
- *Completing graded grammar exercises in Rosetta Stone.*
- *Completing graded listening and reading comprehension exercises in Rosetta Stone.*
- *Watching TED videos and making notes.*
- *Watching TED videos to paraphrase and summarize.*
- *Ad- making.*
- *Preparing brochure.*
- *Dialogue writing followed by role play.*
- *Poster designing.*
- *Team presentation with PPTs and Group Discussion..*

UNIT - V **L-9**

- Text : **Media Matters**
  (History of Media – Language and Media – Milestones in Media – Manipulation by Media – Thousands march against nuclear power in Tokyo (from Energy Unit) - Entertainment Media – Interviews)
- Grammar : Common Errors
- Vocabulary : One-word Substitutes
- Composition : E-mail – Short Message Service (SMS) - Writing Advertisements, Reporting, Social Media: Blogging, Facebook, Twitter (acceptable & non acceptable content)
- Laboratory Practice : Group Discussions – (Topics from Energy unit) – Dumping of nuclear wastes, Exploration of eco-friendly energy options- lifting of subsidies on Petrol, Diesel, LPG etc)

16CS101 BASICS OF COMPUTER AND INTERNET

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course provides students with a working knowledge of the terminology, processes, and components associated with Computers and Internet. Students will get exposure to Building blocks of Computers, Operating Systems, Application software, Networking, Internet, World Wide Web, Security, Maintenance, Information Systems, and the application development processes.

Course Outcomes:

The student will be able to :

- understand the terms and concepts of Computer Science and Information Technology (hardware, software, networking, security, Internet/Web, and Technologies).
- use the products and services of computers.
- use Internet/Web services as a resource for developing shared applications.
- install different operating systems and application software

SKILLS:

- ✓ *Assemble and disassemble the personal computer system*
- ✓ *Install different desktop operating systems*
- ✓ *Use the basic text processing, simple data analysis and data presentation tools*
- ✓ *Configure network parameters*
- ✓ *Secure the personal computer and information from various external threats.*

ACTIVITIES:

- *Prepare a report on various generations of computers and its peripherals.*
- *Disassembling and assembling of a personal computer system.*
- *Install the Linux operating system and other software required in a personal computer system.*
- *Connect the system to an Ethernet and configure the same.*
- *Prepare an MS Word Document.*
- *Prepare a spread sheet with various mathematical operations, charts and sorting etc.*
- *Make a report on power point presentation for the given topic.*

UNIT - I **L- 10**

COMPUTING SYSTEMS : Introduction to computer, computers for individuals, importance of computers, parts of computer system, memory devices, input and out devices, types of monitors, types of printers, number systems, bits and bytes, text codes and types of processors.

UNIT - II **L- 10**

OPERATING SYSTEMS : Types of operating systems, user interfaces, PC operating systems, network operating systems, types of software, programming languages, compiler and interpreter, program control flow and algorithm.

UNIT - III **L- 08**

NETWORKS & DATABASES : Networking basics, uses of network, types of networks, network hardware, introduction to data bases and database management systems.

UNIT - IV **L- 8**

INTERNET AND WWW : Internet's services, world wide web, browser setups, using search engine, email and other internet applications.

UNIT - V **L- 9**

CYBER SECURITY : The need of computer security, basic security concepts, threats of users, online spying tools, threats to data, cybercrime, protective measures.

LABORATORY EXPERIMENTS

Course Outcomes:

Upon successful completion of this course, the student will be able to:

- know the usage of the computer systems.
- setup the IDEs for the computer programming languages.
- get exposure on office automation tools like Microsoft Word, Excel, and power point.
- identify the different computer system and data threats and also protect them by installing antivirus software.

LIST OF EXPERIMENTS Total hours: 30

1. Demonstrate the Personal Computer Peripherals and get a report on each peripheral.
2. Demonstrate the Personal computer assembling procedure and do the same.
3. Install wide varieties of free and open source operating systems.
4. Demonstrate Network Interface Card (NIC) configuration and any internet browsers options setup.
5. Demonstrate the Java Development Kit (JDK) installation and environmental variable (PATH) setup.
6. Demonstrate the following experiments using Office automation tools
   a. Text formatting and table.
   b. Mathematical equations.
   c. Watermarking using Analysis tool.
   d. Calculate student mark details.
   e. Create four types of charts.
   f. Import external data, sort & filter using Power Point tool.
   g. Create text and images with effects.
   h. Create animation and sound effects.
7. Demonstrate the installation of anti-virus software to detect different types of virus programs.

TEXT BOOK :

1. Peter Norton, *"Introduction to Computers"*, 7th edition, Tata-McGrawHill, 2010

REFERENCE BOOKS:

1. ITL Education Solution Limited, *"Introduction to Computer Science"*, 2nd edition, Pearson Education, 2011.
2. Eric Maiwald, "*Fundamentals of Network Security"*, 3rd edition, Tata-McGrawHill, 2004.

16CS102 COMPUTER PROGRAMMING

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
48	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	5

Course Description and Objectives:

This course is aimed at offering fundamental concepts of programming language to the students. It starts with the basics of C-programming and deals with the structure and various attributes required for writing a 'C' program. It also introduces various operators and control statements used in programming. Then it switches to functions and arrays. It goes on with strings, pointers, files & the user defined data types. As a first-level course in computer science, it forms the basis to understand usage of various attributes in writing a program.

Course Outcomes:

The student will be able to :

- understand the basic terminology used in computer programming to write, compile & debug programs in 'C' language.
- use different data types to design programs involving decisions, loops and functions.
- understand the allocation and Usage of dynamic memory.
- understand the usage of files & structures.

SKILLS:

- ✓ *Identify suitable data types for an application.*
- ✓ *Apply control statements for decision making problems.*
- ✓ *Use multidimension array for matrix application.*
- ✓ *Design a program to calculate average of a class.*
- ✓ *Analyze the difference between static & dynamic memory allocation.*

UNIT - I **L- 10**

INTRODUCTION TO C PROGRAMMING : structure of C program: comments, processor statement, function header statement, variable declaration statement and executable statement; C character set: constants, identifiers, operators, punctuations, keywords, modifiers, identifiers, variables, c scopes, basic data types, type qualifiers, storage classes, reading and writing characters, formatted I/O.

UNIT - II **L- 10**

OPERATORS AND CONTROL STATEMENTS : Operators: assignment, arithmetic, relational, logical, bitwise, ternary, address, indirection, size of, dot, arrow, and parentheses operators; expressions precedence of operators, associative rules; control statements: category of statements, selection, iteration, jump, label, expression and block.

UNIT - III **L- 10**

FUNCTIONS AND ARRAYS : Function: declaration, prototype, definition, calling by value and call by address, standard library functions and recursive functions; Array: declaration, initialization, reading, writing, accessing and passing as a parameter to functions, 2D-arrays, multidimensional arrays.

UNIT - IV **L- 9**

STRINGS AND POINTERS : Strings: declaration, string library functions, array of strings, command line arguments; pointers: declaration, initializing pointers, multiple indirection, relationship between arrays and pointers; scaling up: array of arrays, array of pointers, pointer to a pointer, pointer to an array; pointer to functions, dynamic memory allocation functions.

UNIT - V **L- 9**

STRUCTURES AND FILES : Structures: Declaration, initialization and accessing, array of structures and passing structures to functions, structure pointers, arrays and structures within structures, unions, bit-fields, types and enumerations; Files: I/O and processing operations on text and binary files; pre-processor directives.

ACTIVITIES:

- *Implement matrix operations.*
- *Implement malloc and calloc functions.*
- *Copy the content of one file into the other.*
- *Implement string manipulations functions.*

LABORATORY EXPERIMENTS

Course Outcomes:

Upon successful completion of this course, the student will be able to:

- write, compile and debug programs in C language.
- formulate problems and implement algorithms in C.
- choose programming components that efficiently solve computing problems in real-world.

LIST OF EXPERIMENTS

Total hours: 30

1. Compute the factors of a number.
2. Compute the average of ‘n’ numbers.
3. Find whether a number is palindrome or not.
4. Find whether a number is a power of 2 or not.
5. Compute the factorial of a number.
6. Implement any kind of operation (+,-,*,/,%) using a switch case.
7. Swap two values useing call by value and call by reference.
8. Using structure of arrays.
9. Find the reversal of a number.
10. Find the frequency of each number in the array.

11. Which takes 0's & 1's as input and the array should consist of all 0's first and then 1's.
12. Copy the first 10 words of a file into the other file.
13. Count the number of words in a file.
14. Create a structure which stores the student's information in a class.
15. Reverse the contents of the array.
16. Implement pointer of pointers.
17. Give n^{th} term of the Fibonacci number.
18. Find the factorial of a number using recursion.
19. Find the number of vowels in a file.
20. Access the structure and union members.

45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course enables the students to understand the basics of civil, mechanical, electrical and electronics systems and components used in day-to-day life. It deals with construction materials, power generation principles and working of a few commonly used household appliances. Besides, the student will be able to identify/appreciate various concepts, service and maintainance of engineering products.

Course Outcomes:

The student will be able to:

- gain knowledge and hands-on experience on various engineering products
- install, operate, maintain and troubleshoot basic mechanical, electrical and electronic appliances.
- understand the concept of conservation of energy
- gain awareness on choosing appropriate construction materials

SKILLS:

- ✓ *Identify UPS requirements for a given load*
- ✓ *Provide a Lighting scheme for specific working environment.*
- ✓ *Design a composition of Heating element for a particular application.*
- ✓ *Trouble shoot issues relating to Immersion Heater and Induction Heater.*
- ✓ *Provide an earthing for Domestic Outlet*
- ✓ *Select, Configure and maintain a few engineering appliances. Such as TV, Radio, Telephone, Mobile phone, Wifi Router, Micro oven, PA system etc.*

ACTIVITIES:

- *Trouble shooting of immersion heater and induction heaters.*
- *Disassembling and Assembling of Domestic Appliances such as Mixer Grinder, Fan etc.,*
- *Providing Earthing for Domestic Outlet*
- *Designing Electric Wiring system for a prototype house*
- *Designing UPS for a defined load*
- *Practice assembly of a FM radio*
- *Configure a Wifi Router for required number of users*

UNIT - I **L- 9**

WORKING PRINCIPLE OF AC, REFRIGERATOR, PUMPS, IC ENGINES AND SCREW JACK: Working principle of Air-conditioner and Refrigerator- components, assembly and disassembly, Working principle of Centrifugal and Reciprocating pumps: Types, parts and applications, working principle of Screw jack and its components. Working principle of IC engines- 2 stroke and 4 stroke.

UNIT - II **L- 10**

BRICKS : General, Qualities and Classification of bricks, Tests for bricks, Size and Weight of bricks.

Timber: Definition, Qualities of good timber, Decay of timber and Advantages of timber in construction.

CEMENTS : Types and composition of Cement, Setting of cement, Tests for physical properties of cement, Different grades of cement.

AGGREGATES : Classification of aggregates, Source, Size and Shape of aggregates, Tests for aggregates

STEEL: Types of steel, Physical properties and Mechanical properties of steel.

Simple layout design, paints, tiles,fittings, ventilation, furniture and green house aspects.

UNIT - III **L- 08**

ELECTRIC ENERGY SYSTEMS : Overview of Power System Structure – Conventional and Non Conventional Generations - Types of Turbines, Generators, Substations, Towers – Earthing procedure – Protection schemes – Single Phase and Three Phase Systems

Methods of Electrical Wiring Systems - Wiring procedure and calculations – Wiring methods.

Un-Interruptible Power Supply (UPS) – Components in UPS – its functionality – Calculation of ratings for UPS components to a specific load.

UNIT - IV **L-10**

LIGHT : Light Energy – Evolution of Light sources – Working of Incandescent, Fluorescent, MV, SV and LED Lamps – Comparison and Applications.

HEAT : Heat Energy – Modes of Heat Transfer – Resistance and Induction Heating – Comparison and Applications.

MOTOR : Electric Motors – Classification – Construction and Working principles of motors used in Domestic Applications - Mixer Grinder, Ceiling and Exhaust Fan, Hair Dryer, Washing Machine, Water Pump, Air Coolers, Vacum Cleaner, Computer Cooling Motor, Electric Bike.

UNIT - V **L- 8**

HOUSE HOLD ELECTRONIC APPLIANCES: Working principles of Television, Radio, Remote Control, Telephone, Microwave Oven, Cell phone, PA system, Induction Stove, WiFi Router and DTH.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Demonstration of Modelling / functioning / disassembly / assembly / fault rectification / understanding of the following.

1. Air-conditioners and Refrigerators
2. 2 stroke and 4 stroke engines
3. Reciprocating pumps
4. Power screw jack
5. Size and Water absorption capacity of Bricks.
6. Initial and final setting time of cement.
7. Toughness value of coarse aggregates.
8. Bulking of sand.
9. Fan and Immersion heater
10. Solar panel connections to different loads with Battery and without battery
11. Television
12. Radio
13. Remote Control
14. Telephone
15. Fax Machine
16. Mobile phone
17. PA system

16HS104 ENGLISH PROFICIENCY AND COMMUNICATION SKILLS

Hours Per Week :

L	T	P	C
0	-	2	1

Total Hours :

L	T	P
0	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To equip the students with Functional English by exposing them to a wide range of language use in different contexts and thereby encourage them to use the language comfortably in real life situations. Students will strengthen their comprehension skills of listening and reading by acquiring adequate vocabulary through perusing authentic materials gathered from news papers, journals and other mass communication media.

Course Outcomes:

The student will be able to :

- use functional English to speak and express themselves in different social contexts
- write simple letters, narratives, factual reports and descriptive passages for both academic and non-academic purposes in English.
- gain proficiency to undergo Preliminary English Test (PET), an Intermediate Level English Certification Test administered by Cambridge English Language Assessment, UK.

SKILLS:

- ✓ *ability to use appropriate words in right order for effective sentence formation, and writing short texts*
- ✓ *ability to read and extract information from different texts & draw inferences by understanding elements like tone and transitional words*
- ✓ *ability to understand short and long spoken discourses through analysis of elements like stress and intonation*
- ✓ *ability to articulate clearly thoughts and ideas on simple every day topics*

UNIT - I **L- 10**

Functions : Introducing Self/others; Expressing needs/feelings/opinions (SWOT Analysis)

Skill Focus:

Reading – Understanding factual information

Writing – Word order and sentence formation

Listening – Decoding for meaning following elements of stress, intonation and accent

Speaking – Articulating syllables clearly, speaking fluently with correct pronunciation

Vocabulary – Discerning to use right word for the given context

Grammar – Spellings, use of nouns, adjectives, verbs, prepositions in the sentence structure

Practice: Objective PET Units 1 - 6

UNIT - II **L- 10**

Functions : Defining; Describing People, Places, Things, Process.

Skill Focus:

Reading – Inferences from sentences and short messages – True or False

Writing – Rewording – Sentence transformation - Convincing

Listening – Understanding the short messages and conversations

Speaking – Role-plays, short conversations

Vocabulary / Grammar – Use of adjectives/adverbs, Comparatives and Superlatives

Practice : Objective PET Units 7 – 12

UNIT - III **L- 12**

Functions : Describing Spatial and Temporal Relations; Giving Directions/Instructions

Skill Focus:

Reading – Reading between the lines – Inferences – True/False

Writing – Developing hints - Writing short messages/paragraphs

Listening – Searching for factual information - Gap filling

Speaking – Snap talks, JAM, Elocution

Vocabulary / Grammar – Prepositions; Phrasal Verbs; PET word list

Practice: Objective PET Units 13 - 18

UNIT - IV **L- 9**

Functions : Narrating; Predicting; Negotiating; Planning

Skill Focus:

Reading – Reading for evaluation and appreciation - Comprehension

Writing – Letters – e-mails – 7 C's

Listening – Following long conversations / interviews

Speaking – Discussions – Debate - Descriptions

Vocabulary / Grammar – Modals – Conditionals - verb forms (Time and Tense)

Practice: Objective PET Units 19 – 24

ACTIVITIES:

- *SWOT Analysis*
- *Snap talks*
- *Spell Bee*
- *Short conversations*
- *Role play*
- *Quiz*
- *Elocution*
- *JAM*
- *Group Discussion Debate*
- *Team presentations*

UNIT - V **L- 9**

Functions: Requesting; Denying; Suggesting; persuading

Skill Focus:

Reading – Understanding factual information

Writing – Short Stories, Explanatory Paragraphs

Listening – Inferences from long speeches/conversations

Speaking – Announcements - Presentations

Vocabulary / Grammar – Punctuation – Cloze tests

Practice: Objective PET Units 25 – 30

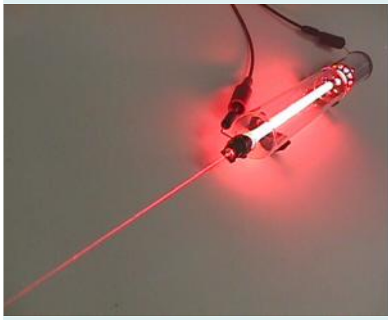
TEXT BOOK:

1. Louise Hashemi and Barbara Thomas, *"Objective PET"*, Student's Book with Answers, 2nd edition, Cambridge University Press, 2015.

REFERENCE BOOKS :

1. Cambridge Preliminary English Test Without Answers 8
2. Annette Capel and Rosemary Nixon, *"Introduction to PET"*, Oxford University Press,

16HS110 ENGINEERING PHYSICS LABORATORY



Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course Outcomes:

Upon successful completion of this course, the student will be able to:

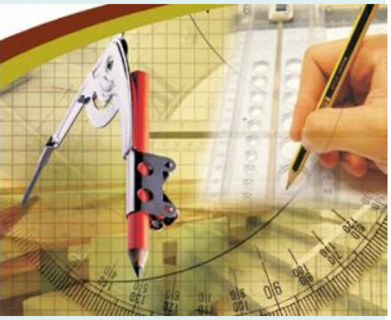
- realize the concept of resonance by conducting the experiments of AC sonometer and Melde's experiment.
- acquire the knowledge on magnetic field theory, thermal conductivity by conducting experiments of field along the axis of a circular coil and thermal conductivity of bad conductor
- understand the concepts of light by conducting the experiments of determination of wave length, numerical aperture of an optical fibre and also from V–I characteristics of Solar cell and LED.

LIST OF EXPERIMENTS

1. Determination of Velocity of ultrasonic waves in liquids.
2. Melde's Experiment - Transverse and Longitudinal modes.
3. Determination of wave length – Helium - Neon laser
4. Determination of Planck's constant
5. Determination of Frequency of Alternating current
6. Field along the axis of a circular coil – Stewart and Gee's apparatus.
7. Band gap of semiconductor
8. Hall coefficient
9. Thermal conductivity of bad conductor - Lee's method
10. Optical Fibre – Determination of numerical aperture
11. Solar Cell – efficiency
12. Study of V – I characteristics of LED.
13. Seebeck effect

REFERENCE BOOKS :

1. Jayaraman, "Engineering Physics Laboratory manual", 1st edition, Pearson Education, 2014.
2. Engineering Physics laboratory Manual – Department of Physics, VFSTR University, 2016.



16HS108 ENGINEERING MATHEMATICS – II

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

It is aimed to offer different methods for finding rank of a matrix, solving linear equations using matrices, to computer Eigen values and Eigen vectors, to verify C.H.T. and apply it to find power of a matrix. Also, to make the students familiarize with double and triple integrals, to make the student acquainted with the concepts of vector differentiation and integration, to make the student to use different mathematical tools of Mat lab related to above concepts.

Course Outcomes:

The student will be able to :

- carry out the basic operations of matrix algebra
- use row operations to reduce a matrix to echelon form, normal form
- determine consistency of a system linear equations
- compute eigen values and eigen vectors
- evaluate double integrals and triple integrals
- evaluate double integrals in polar coordinates
- utilize Cartesian and polar coordinates to find area
- understand the concept of gradient, divergance and curl.
- apply vector integral theorems in finding surface and volume integrals

SKILLS:

- ✓ *Appreciate various methods to find the rank of a matrix.*
- ✓ *Solve given system of linear equations.*
- ✓ *Compute Eigen values and Eigen vectors of a matrix.*
- ✓ *Compute the power of a matrix by suitable method.*
- ✓ *Evaluate Multiple integrals*
- ✓ *Evaluate surface and volume integrals through vector integral theorems.*

UNIT - I **L-9**

Rank Of Matrix and Linear Equations: Rank of a matrix, Normal form, Triangular form, Echelon from; Consistency of system of linear equations, Gauss-Jordan method, Gauss elimination method, Gauss-Siedal method.

UNIT - II **L- 9**

Eigen Values and Eigen Vectors: Eigen values, Eigen vectors, properties (without proofs), Cayley-Hamilton theorem (without proof), power of a matrix, diagonalisation of a matrix.

UNIT - III **L- 9**

Multiple Integrals: Double integrals, Evaluation, Evaluation in Polar coordinates, Change of order of integration, Change of variables, Applications to Area in Cartesian coordinates and polar coordinates; Triple integrals, Fundamentals, Evaluation of triple integrals.

UNIT - IV **L- 9**

Vector Differentiation: Vector Function, Differentiation, Scalar and Vector point function, Gradient, Normal, Divergence, Directional Derivate, Curl, Vector identities.

UNIT - V **L- 9**

Vector Integration: Line Integral, Surface Integral, Volume integral, Green's theorem, Stoke's theorem, Gauss theorem of divergence (without proofs).

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Matrix Algebra
2. Rank of a matrix
3. System of equations (Direct method)
4. System of equations (Cramer's Rule)
5. System of equations (matrix inversion method)
6. Eigen values and Eigen vectors of a matrix
7. Powers of matrix & Cayley-Hamilton Theorem
8. Vector algebra
9. Gradient
10. Divergence
11. Curl
12. Multiple Integrals (Area etc.)
13. Interpolation

TEXT BOOKS :

1. H. K. Dass and Er. Rajanish Verma, *"Higher Engineering Mathematics"*, 3rd edition, S. Chand & Co., 2014
2. B. S. Grewal, *"Higher Engineering Mathematics"*, Khanna Publishers, 44th edition, 2014.
3. Rudra Pratap, *"Getting started with Matlab"*, Oxford University Press, 2009

REFERENCE BOOKS :

1. Srimanta Pal and Subodh C. Bhunia, *"Engineering Mathematics"*, Oxford Publications, 2015
2. B. V. Ramana, *"Advanced Engineering Mathematics"*, 25th reprint, McGraw Hill Education, 2015.

4. Erwin Kreyszig, *"Advanced Engineering Mathematics"*, 8th edition, John Wiley & Sons (Asia) Pvt. Ltd., 2001.

ACTIVITIES:

- *Differentiate the methods to find the rank of a matrix.*
- *Solve given system of linear equations and compare with Matlab output.*
- *Compute Eigen values and Eigen vectors of a matrix and compare with Matlab output.*
- *Compute the power of a matrix by suitable method.*
- *Evaluate multiple integrals and compare with Matlab output.*
- *Evaluate surface and volume integrals through vector integral theorems.*

16HS107 ENGINEERING CHEMISTRY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	-	10	-	-

Course Description and Objectives:

This course aims to develop fundamental knowledge on new engineering materials and their significance in science and engineering applications. In addition, characterization of materials using basic and advanced experimental techniques is also offered. Besides, analysis of water sample and treatment method for domestic, commercial and industrial applications are also covered.

Course Outcomes:

The student will be able to :

- understand the limitations of using hard water for domestic and industrial purposes.
- choose and apply suitable methods to soften the hard water for industrial and domestic applications.
- understand electrochemistry and its importance for applications such as fuel cells, modern lithium ion batteries etc.
- understand the types of corrosion and their implications followed by their control and prevention methods.
- familiarize the preparation, properties and applications of various polymers.

SKILLS:

- ✓ *Analyse the total hardness of water sample*
- ✓ *Understand the basic principles involved in various batteries.*
- ✓ *Understand the mechanisms of corrosion and various controlling methods.*
- ✓ *Synthesize various polymers.*
- ✓ *Identify the functional groups present in chemical compounds using Infrared and Ultraviolet instruments.*

UNIT - I **L- 9**

WATER TECHNOLOGY : Introduction, WHO, BIS standards of water, Hardness of water - Determination of hardness by EDTA (Numerical Problems), Disadvantages of hard water-Scales and Sludges - Caustic embrittlement - Boiler Corrosion - Priming and Foaming; Softening Methods - Zeolite process, Ion Exchange process; Desalination of Brackish water-Reverse Osmosis, Electrodialysis.

UNIT - II **L- 9**

ELECTRO CHEMISTRY: Electrode Potential, Electrochemical Series, Nernst Equation, Reference Electrodes - Calomel and Standard Hydrogen Electrode, Ion Selective Electrode, Glass Electrode; Determination of pH by pH meter, Primary cell, Secondary cell - Lead-acid storage cell, Lithium ion battery; Fuel cell - Hydrogen Oxygen, Methanol Oxygen.

UNIT - III **L- 9**

SCIENCE OF CORROSION : Introduction, Dry corrosion, Wet corrosion - Mechanisms of wet corrosion; Bimetallic corrosion - Concentration cell corrosion; Factors influencing the rate of corrosion, Corrosion control methods - Cathodic protection, Electroplating, Electrolessplating, Corrosion inhibitors.

UNIT - IV **L- 9**

POLYMERS: Introduction, Types of Polymerization - Preparation, Properties and applications of Polyethylene, PVC, Teflon, Bakelite, Urea Formaldehyde, Silicones, Rubber – Vulcanization; Synthetic Rubbers - Buna-S, Buna-N, Neoprene; Introduction to Conducting polymers - Poly thiophene.

UNIT - V **L- 9**

INSTRUMENTAL TECHNIQUES: Interaction of radiation with matter, UV - Visible Spectroscopy-Beer - Lambert's law - Qualitative and Quantitative Analysis; Block diagram of UV- Visible Spectrophotometer ; IR Spectroscopy - Types of Vibrations - Block diagram of IR Spectrophotometer.

TEXT BOOKS :

1. P.C Jain and Monica Jain, *"Engineering Chemistry"*, 17th edition, Dhanpat Rai Publications, 2010.
2. Shashi Chavala, "*A Text book of Engineering Chemistry Engineering Materials and Applications"*, 3rd edition, Dhanpat Rai Publications, 2015.

REFERENCE BOOKS:

1. K.S. Maheswaramma and Mridula chugh, *"Engineering Chemistry"*, 1st edition, Pearson publication, 2015
2. M.R. Senapati, *"Advanced Engineering Chemistry"* 2nd edition, Lakshmi Publications, 2006.
3. H. W. Wilard and Demerit, *"Instrumental methods of Analysis"*, 7th edition, CBS Publications,1986.
4. Gurudeep Raj and Chatwal Anand, *"Instrumental Methods of Analysis"*, 5th edition, Himalaya Publications, 2007.
5. J.D. Bares, M.Thomas, B. Siva Sankar,J.Mendham, R.C Denney, *"Vogel's Text book of qualitative Chemical Analysis"*, 6th edition, Pearson Publications, 2009
6. Dr.Sunita Rattan, *"Experiments in Applied Chemistry"* by S.K. Kataria & Sons publications, 2008.

ACTIVITIES:

- *Collect water samples from different villages near VFSTR University and determine the total hardness, and total alkalinity.*
- *Present the water analysis report to the villagers and suggest proper measures to be taken.*
- *Measure the rate of corrosion of iron objects by weight loss method.*
- *Identify some of the functional groups like carboxylicacid, aldehyde and ketones by I.R. Spectroscopy.*
- *Collect water sample from different villages and estimate the fluoride present in the raw water and suggest some steps for the removal of fluoride.*

16ME101 ENGINEERING GRAPHICS

Hours Per Week :

L	T	P	C
1	-	3	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
15		45	6	15	-	5	-	-

Course Description and Objectives:

The main aim of this course is to familiarize the students with the conventional concepts of engineering drawing and computer aided applications in various fields. Engineering graphics is an "International language of Engineers". It is the most effective method of communicating technical ideas in a 2D and 3D format.

Course Outcomes:

The student will be able to :

- sketch engineering objects in the freehand mode
- create geometric construction with hand tools.
- create dimensions of objects.
- prepare plan and elevation of any pictorial view.
- draw freehand lettering.
- make isometric sketches using graphics.
- draw orthographic multi-view sketches using graphics.

SKILLS:

- ✓ *draw free hand sketches, layouts, circuit diagrams, plan and elevations*
- ✓ *draw geometrical objects like polygons, solids of different types*
- ✓ *visualize the objects in real time situations*
- ✓ *develop 3D views (isometric views)*

UNIT – I **L-3, P-10**

INTRODUCTION TO ENGINEERING DRAWING: Introduction to Engineering Drawing: Types of lines, lettering, dimensioning Construction of polygon and Conics. (Ellipse, Parabola and Hyperbola by general method), ellipse by oblong method.

UNIT-II **L-3, P-8**

ORTHOGRAPHIC PROJECTIONS: Principle of projection-Planes of projections; Projections of points; Projection of straight lines; Inclined to one plane and both the planes; Projections of planes; Simple planes, Planes inclined to one reference planes.

UNIT – III **L-3, P-8**

PROJECTIONS OF SOLIDS: Projections of prisms, pyramids, cylinders, cones, solid axis inclined to one plane.

UNIT – IV **L-3, P-10**

AUTOCAD: Introduction to AutoCAD

ISOMETRIC VIEWS: - Isometric drawing of simple objects- isometric view of prisms; pyramids; cone and cylinder – simple orthographic views into isometric views through AutoCAD.

UNIT – V **L-3, P-9**

ORTHOGRAPHIC VIEWS: - Conversion of pictorial views into orthographic views through AutoCAD.

TEXT BOOKS :

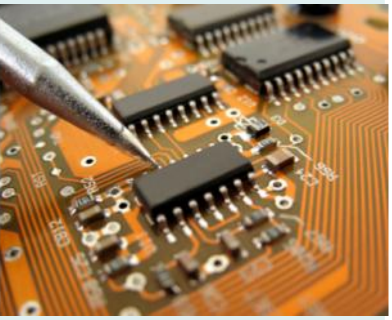
1. N.D.Bhatt, “Engineering Drawing”, 53rd edition., Charotar Publication, 2014.
2. Basant Agrawal , C.M.Agrawal “Engineering Drawing” , 2nd edition., Tata McGraw Hill,2014.

REFERENCE BOOKS :

1. J. hole, *“Engineering Drawing”*, 2nd edition, Tata McGraw Hill, 2008.
2. K.L. Narayana, *“Engineering drawing”*, 2nd edition, Scitech Publications, 2008.

ACTIVITIES:

- *Draw line diagram of different machineries.*
- *Draw plan and elevations of buildings and engineering products.*
- *Understand, visualize 3-D components/ products and develop drawings.*
- *Draw different curves used in several engineering applications such as bridges, dams etc.*



16EE102 BASICS OF ELECTRICAL AND ELECTRONICS ENGINEERING

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	5

Course Description and Objectives:

This course provides an in-sight into the functioning of basic electrical components like resistor, inductor and capacitor. It deals with the constructional and operational details of both D.C & A.C machines. It also deals with the basic electronic components like P-N Junction Diode, Zener diode, Transistor and their characteristics.

Course Outcomes:

The student will be able to:

- understand the notation and usage of components in electric circuits
- analyze AC (single and three phase) and DC. AC circuits using different methods and laws
- operate various electrical machines.
- understand the concepts of Semiconductor devices and their operation

SKILLS:

- ✓ *Distinguish between linear and nonlinear elements by looking at VI characteristics.*
- ✓ *Develop a simple loop generator.*
- ✓ *Design a voltage regulator using Zener diode.*
- ✓ *Design a half wave rectifier using PN junction diode.*
- ✓ *Design a full wave rectifier using PN junction diodes.*

UNIT – I **L-9**

FUNDAMENTALS OF DC CIRCUITS: Circuit Concepts: Concepts of network, Active and passive elements, voltage and current sources, concept of linearity and linear network, unilateral and bilateral elements, R, L and C as linear elements; Ohm's Law; Kirchhoff's Laws: application to simple series, parallel circuits, mesh and nodal analysis of simple resistive circuits.(Simple numerical problems).

UNIT – II **L-9**

FUNDAMENTALS OF A.C. CIRCUITS: Generation of A.C. voltage - frequency, average value, R.M.S. value, form factor, peak factor for sinusoidal only; phasor representation of alternating quantities; Analysis of simple series and parallel A.C. circuits (simple numerical problems).

BALANCED THREE PHASE SYSTEMS: Relation between phase and line quantities of voltages and currents in star and delta connected systems (Elementary treatment only).

UNIT – III **L-9**

FUNDAMENTALS OF ELECTROMAGNETISM: Concepts of Magneto motive force, reluctance, flux and flux density, concept of self Inductance and mutual Inductance, Coefficient of coupling (only elementary treatment and Simple numerical problems).

TRANSFORMERS: Principle of operation of single phase transformer, constructional features, EMF equation (simple numerical problems).

UNIT – IV **L-9**

DC MACHINES: Constructional details of a D.C. Machine; D.C. Generator; Principle of operation; EMF equation; types of D.C. generators (simple numerical problems).

D.C. Motor: Principle of operation, Torque equation, types of D.C. motors (simple numerical problems)

A.C MACHINES: Principle of operation of three phase induction motors, slip ring and squirrel cage motors, Torque equation, Constructional details of synchronous machine.

UNIT – V **L-9**

SEMICONDUCTOR DEVICES: Classification of solids based on energy band theory; Intrinsic and Extrinsic semiconductors, P-type and N-type semiconductors, P-N junction diode and its characteristics, Half and Full wave rectifiers, Zener diode and its characteristics, Voltage regulator, Bi polar junction transistor, Operation, Types, Applications.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- Apply the ohm's law, KVL and KCL laws to different circuits.
- Calculate the power and energy in electric circuits.
- Operate and find the transformation ratio of transformer at different loads.
- Study and verify the characteristics of semiconductor devices.
- Calculate the efficiency of both HWR and FWR.

LIST OF EXPERIMENTS Total hours: 30

1. Verification of Ohm's law.
2. Verification of Kirchhoff's current law.
3. Verification of Kirchhoff's voltage law.
4. Measurement of Energy in single phase resistive load circuit.

ACTIVITIES:

- *Decoding the value of resistors.*
- *Design and fabricate a simple loop permanent magnet generator.*
- *Design and fabricate a simple air cored transformer.*
- *Fabricate full and half wave rectifiers using PN junction diodes.*
- *Fabricate a voltage regulator using Zener diode.*

5. Measurement of Power in single phase resistive load circuit.
6. Transformation ratio of a single phase transformer at different loads.
7. Verification of PN junction diode characteristics under both forward and reverse bias.
8. Verification of Zener diode characteristics under both forward and reverse bias.
9. Implementation of Half Wave Rectifier without filter.
10. Implementation of Full Wave Rectifier without filter.

TEXT BOOKS:

1. V.K.Mehta, “Principles of Electrical Engineering and Electronics”, 3rd edition, S. Chand Publications, New Delhi, 2010.
2. D.P Kothari, “Basic Electrical and Electronics Engineering”, 1st edition., TMH, New Delhi, 2014.

REFERENCE BOOKS:

16HS111 ENGINEERING CHEMISTRY LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course description and Objectives:

This course is aimed at enlightening the importance of theoretical concepts of chemistry and experimental techniques for characterization of materials.

Course Outcomes:

The student will be able to :

- analyse the total hardness present in water samples.
- determine the total alkalinity of water used in industries.
- acquire the knowledge on polymers used as insulators.
- familiarize advanced techniques in chemical analysis using conductometer and pH meter.

LIST OF EXPERIMENTS

1. Determination of Total Alkalinity of water
2. Estimation of Total hardness of water
3. Find the percentage of available chlorine in Bleaching powder
4. Estimation of Fe (II) by Dichrometry method
5. Preparation of Phenol - Formaldehyde Resin
6. Synthesis of Urea- Formaldehyde Resin
7. Estimation of Concentration of acid by pH metry.
8. Determination of Strength of acid by Conductometry
9. Measurement of Mn^{+7} by Colorimetry.
10. Determination of concentration of a salt by ion exchange method.
11. Find the concentration of Mn^{+7} and Cr^{+6} by UV-Visible Spectrophotometry.
12. Find the rate of corrosion by weight loss method.

TEXT BOOKS :

1. J.Mendham, R.C.Denney, J.D. Bares, M.Thomas & B.Siva Sankar, “Vogel’s Text book of qualitative Chemical Analysis”, Pearson Publications - Volume I 2009
2. Dr.Sunita Rattan “Experiments in Applied Chemistry”, S.K. Kataria & Sons Publications, 2008.

16HS109 ENVIRONMENTAL SCIENCE AND TECHNOLOGY

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
30	-	-	10	20	4	-	4	-

Course Description and Objectives:

Environmental Science and Technology offers technological aspects of environmental science and in maintaining environmental integrity in relation to human development. It helps every engineer to plan appropriate strategies for addressing environmental issues and also contribute to the development of innovative technologies for solving such issues. It produces professionals who will ensure sustainable development of the nation in general and environmental in particular.

Course Outcomes:

The student will be able to :

- observe and integrate the diverse information from sources outside the classroom
- think critically, creatively, resourcefully and strategically, including identifying steps needed to reach goals, manage projects, evaluate progress, and adapt approaches, developing both self reliance, and civic mindedness
- adapt eco-friendly technologies in order to maintain hygienic conditions
- understand the human activities that are detrimental to environment
- collaborate across diverse disciplines to identify and create solutions that conserve and help maintain biodiversity in the long term
- discuss the issues involved in the generation of renewable energy resources.

SKILLS:

- ✓ *Understand structural relationships, abstract models, symbolic languages and deductive reasoning*
- ✓ *Gain perspectives to adrress the challenges, improvise and devise solutions*
- ✓ *Identify solutions to environment and development issues, using planning, analysis, modeling, and new approaches*
- ✓ *Acquire fieldwork techniques to study, observe and prepare documents, charts, PPTs, Models etc.*
- ✓ *Understand how natural resources should be used judiciously, to protect biodiversity and maintain ecosystem*

UNIT- I **L-6**

NATURAL RESOURCES

Environmental Studies: Definition Scope and its importance, Need for Public Awareness, Natural Resources, Forest Resources - deforestation ; Water resources - Properties and conflicts, Mineral resources - extraction and impacts, Food resources - Modern agriculture methods, fertilizer-pesticide problems, water logging, salinity, Energy resources - renewable and non-renewable energy resources, Harness technology, Solar energy technologies, Land resources - land degradation, soil erosion; Role of an individual in conservation of natural resources.

UNIT- II **L-6**

ECOSYSTEMS AND BIODIVERSITY

Ecosystem : Concept, Structure and functions of an ecosystem, Food chains, Food webs, Ecological pyramids, Energy flow, Energy regulation, Succession, Biogeochemical cycles, Aquatic ecosystems.

Biodiversity : Introduction, Bio-geographical classification, Values of biodiversity, Biodiversity at global, National and local levels, Hot-spots of biodiversity, Threats to biodiversity, Endangered and endemic species of India, Conservation of biodiversity.

UNIT- III **L -6**

WASTE MANAGEMENT AND GREEN TECHNOLOGY

Solid waste Management: Causes, effects and control measures of Municipal and Industrial wastes; Pollution - Air, Water, Thermal, Soil and Noise Pollutions; Role of an individual in prevention of pollution; Remote sensing / GIS - Introduction, definitions, applications of the remote sensing, Innovative practices-objectives, innovative practices in agriculture and forestry-community, Bio-villages.

Green technology for Sustainable development, Life cycle assessment and its Concept.

UNIT- IV **L -6**

SOCIAL ISSUES AND EIA

Sustainable development, Water conservation, Cloud Seeding, Rainwater Harvesting Methods Watershed management, Global warming, Acid rain, Ozone layer depletion, Environmental Legislation: Wildlife Protection Act - Water Act - Forest Conservation Act - Air Act. – Environmental Protection Act. Environmental Impact Assssment (EIA) - Introduction, definition of E.I.A and E.I.S, Scope and objectives, Importance of E.I.A in proposed Projects / Industry / Developmental activity.

UNIT- V **L-6**

ENVIRONMENTAL SANITATION

Food sanitation **-** food and drugs Act, Food preservations, Milk sanitation, tests for milk, pasteurization of the milk; Water , Air, Soil and food borne diseases, Maintenance of sanitary and hygienic conditions, Role of youth in the development, Promoting activities -Youth as initiators and activities.

Field work/Environmental Visit - Visit to a local area to document environmental assets river/ forest/ grassland / hill /mountain, Study of local environment - common plants, insects, birds; Study of simple ecosystems - pond, river, hill slopes etc., Visit to industries/water treatment plants/effluent treatment plants.

1. Anubha Kaushik- CP Kaushik, “Perspectives in Environmental Studies”, 5th edition, 2016
2. Benny Joseph, “Environmental studies”, 2nd edition, Mc Graw Hill Education, 2015.

ACTIVITIES:

- *Painting contests on environmental issues and themes.*
- *Models of energy resources, Pollution and Solid Waste Management-3R strategy*
- *Quiz competition.*
- *Essay writing competition.*
- *Skit, JAM and debate.*
- *Field work and documentation.*
- *Assignments.*

16ME102 ENGINEERING MECHANICS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	30	-	5	-	5

Course Description and Objectives:

Engineering Mechanics is the application of mechanics to solve problems involving common engineering elements. The goal of this course is to expose students to problems in mechanics as applied to plausibly real-world scenarios.

Problems of particular types are explored in detail in the hopes that students will gain an inductive understanding of the underlying principles at work, students should then be able to recognize problems of this sort in the real-world situations and respond accordingly. The course uses the Laws of Mechanics to predict forces in and motions of machines and structures. The course is the key prerequisite course to sequences of courses dealing with mechanics of machines, stress analysis and design of mechanical systems.

Course Outcomes:

Upon completion of this course, the student will be able to:

- use scalar and vector analytical techniques for analyzing forces in statically determinate structures.
- apply basic knowledge of mathematics and physics to solve real-world problems.

SKILLS:

- ✓ knowledge on classical mechanics, scalar, vector quantity, force, system of force, resultant force, moment of a force, force-couple
- ✓ comprehensive, theory based understanding of the underpinning natural and physical sciences and the engineering fundamentals applicable to the engineering discipline
- ✓ knowledge on equilibrium condition
- ✓ in-depth understanding of specialist bodies of knowledge within the engineering discipline.
- ✓ application of established engineering methods to complex engineering problem solving.
- ✓ application of systematic engineering synthesis and design processes.
- ✓ idea about the centre of gravity and moment of inertia of a body.

UNIT-1 **L-10; T-3**

GENERAL PRINCIPLES: Introduction to engineering mechanics; idealization in mechanic's basic concepts; vectors and scalar quantity; laws of mechanics.

Force system and resultant: Concept of force; representation of force; system of forces; resolution of forces using rectangular components.

Moments and couples: Introduction; moment of force; varignon's theorem; resultant of parallel forces; couple and moment of couple; characteristic of couple.

UNIT -2 **L-8; T-3**

EQUILIBRIUM OF BODIES: Conditions of equilibrium for a coplanar force system and coplanar non parallel non concurrent force system; principle of equilibrium (two ; three ; force principle) ; Lami's theorem

Truss: Introduction; classification of truss; fundamental of truss; analysis of truss (method of joints and method of section)

UNIT-3 **L-10; T-3**

FRICTION: Introduction ; classification of friction ; coefficient of friction ; laws of friction ; angle of friction ; angle of repose ; cone of friction ; ladder friction ; wedge friction

UNIT-4 **L-10; T-3**

CENTROID: Introduction; centroid of lines; centroid of surfaces; determine of centroid of simple figures; centroid of composite figures; centroid of a parabolic spandrel

Center of Gravity: Introduction; center of gravity; location of center of gravity - right circular cone and solid hemisphere; center of mass; theorem of Pappus.

UNIT-5 **L-10; T-3**

MOMENT OF INERTIA: Moment of inertia of plane areas ; polar moment of an area ; radius of gyration of area; parallel axis theorem ;perpendicular axis theorem; moment of inertia of composite areas. Mass moment of inertia; introduction; radius of gyration of mass; mass moment of inertia of rod; rectangular plate ; right circular cylinder ; circular ring ; circular plate.

16ME103 WORKSHOP PRACTICE

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	45

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	20	-	-

Course Description and Objectives

This course is aimed to impart knowledge and provide hands-on experience in Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring. In addition it also provides knowledge on various manufacturing processes such as Foundary, Welding, Machine Shops and CNC Machines.

Course Outcomes

The student will be able to :

- identify various tools connected to the trades such as Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring.
- fabrication of wooden joints and understand joining of metals.
- make metal joints and sheet metal work
- make metal tools like knives, needles, swords, arrows etc.

SKILLS:

- ✓ *Prepare wooden and metal furniture*
- ✓ *Electrical wiring and power supply in residences.*
- ✓ *Make funnels, trays, locker, steel almirahs etc*
- ✓ *Fabrication of various agriculture tools, hooks, axes, axels, rims etc.*
- ✓ *CNC machines and various machining operations and processes*

ACTIVITIES:

- *To make wooden joints like Mortise and Tenon joint, T-lap Joint which are used to prepare a wooden furniture.*
- *To prepare metal joints and metal sheet products like V-Joint and trays by using mild steel flats and Galvonised iron sheets.*
- *Trials on electrical circuit connections.*

EXERCISES IN THE FOLLOWING TRADES :

1. Carpentry
2. Fitting
3. Tin Smithy and Black smithy
4. House wiring
5. Foundry and Welding (Demonstration)
6. Machine shop and CNC (Demonstration)

Note: In each trade, the student has to perform at least two jobs.

TEXT BOOKS :

1. S.K. Hazra Choudhury, “Elements of workshop Technology”, 11th edition, Media Promoters, 1997.
2. Gopal, T.V., Kumar, T., and Murali, G., “A first course on workshop practice: Theory, Practice and Work Book”, Suma Publications, Chennai, 2005.
3. Venkatachalapathy, V. S., “First year Engineering Workshop Practice”, Ramalinga Publications, Madurai, 1999.

II

YEAR

AGRICULTURE ENGINEERING

B.Tech.

I SEMESTER

16AG201	Engineering Properties of Biological Materials & food Quality
16AG202	Farm Power and Renewable EnergySources
HS16202	Probability & Statistics
16CE202	Fluid Mechanics
16AG203	Principles of Thermodynamics
16AG204	Soil Mechanics
16EL102	Soft Skills Lab

II SEMESTER

16AG205	Crop Production Technology
16AG206	Strength of Materials
16AG207	Surveying & Levelling
16AG208	Theory of Machines
16AG425	Principles of Heat and Mass Transfer
16HS203	Professional Communication Lab

COURSE CONTENTS

I SEM & II SEM

16AG201 ENGINEERING PROPERTIES OF BIOLOGICAL MATERIALS AND FOOD QUALITY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	4	4	5	-

Course Description and Objectives:

This course describes the properties of different food materials and quality standards. The objective of the course is to familiarize the students about the basic properties of food materials for better preservation and use.

Course Outcomes:

After completion of this course students will be able to:

- learn the basic properties of food materials
- apply the properties on industrial scale
- have basic knowledge about food laws
- use the food laws in different food industries.

SKILLS:

✓ *Measure engineering properties of food for the application of various designs in food industry.*

✓ *Analyze the food product available in the market based upon its quality standards.*

ACTIVITIES:

- o *Hazard analysis of pilot scale food manufacturing.*
- o *Quality assessment of various food products by considering existing laws and quality parameter analysis.*
- o *Estimation of engineering properties of different regional crops.*

UNIT - 1 **L-09**

PHYSICAL AND THERMAL PROPERTIES: Importance of engineering properties of biological materials, Study of different physical and thermal characteristics of important biological materials like shape, size, volume, density, roundness, sphericity, surface area, specific heat, thermal conductivity, thermal diffusivity, etc.

UNIT - 2 **L-09**

RHEOLOGICAL AND AERODYNAMIC PROPERTIES: Measurement of colour, flavour, consistency, viscosity, texture and their relationship with food quality and composition. Rheological characteristics like stress, strain time effects, rheological models and their equations. Aerodynamic characteristics and frictional properties.

UNIT - 3 **L-09**

APPLICATIONS OF ENGINEERING PROPERTIES: Application of engineering properties in handling processing machines and storage structures. Concept, objectives and need of quality, quality control, methods of quality control, sampling.

UNIT - 4 **L-09**

QUALITY CONTROL AND ASSURANCE: Purpose, sampling techniques, requirements and sampling procedures for liquid, powdered and granular materials, sensory quality control, panel selection methods. Interpretation of sensory results in statistical quality control, TQM and TQC, Consumer preferences and acceptance.

UNIT - 5 **L-09**

FOOD LAWS: Food Laws and Regulations in India. Food grades and standards like BIS, AGMARK, PFA, FPO, CAC (Codex Alimantarious Commission), Sanitation in food industry, GMP, HACCP (Hazard analysis and critical control point) and ISO 9000 Series.

TEXT BOOKS:

16AG202 FARM POWER AND RENEWABLE ENERGY SOURCES

Hours Per Week :

L	T	P	C
2	-	2	3

Total Hours :

L	T	P
30	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	-

Course Description and Objectives:

This course deals with the different sources of power to perform field operations in agriculture. The objective of the course is to empower the student to think of different sources of energy for farming requirements according to the area of farming.

Course Outcomes:

Upon successful completion of this course, the student should be able to:

- learn the fundamentals of I.C. engine.
- acquire basic information about use of renewable energy in agriculture field.

SKILLS:

✓ *Use of briquetting machine for small scale farmers.*

✓ *Identification of the required specifications of engines used for field operations.*

✓ *Design of solar operated cooker, water heater and lamp.*

ACTIVITIES:

- *Preparation of biomass briquettes.*
- *Development of solar energy operated sprayer, cooker and lamps.*
- *Development of mini wind turbine.*
- *Design of small scale rice husk gasifier.*

UNIT - 1 **L-06**

I.C ENGINES: Sources of farm power conventional and non conventional energy sources. Classification of tractors and IC engines. Review of thermodynamic principles of IC (CI & SI) engines and deviation from ideal cycle. Study of engine components their construction, operating principles and functions.

UNIT - 2 **L-06**

SYSTEMS OF I.C ENGINE: Engine systems- valves and valve mechanism, Fuel and air supply, Cooling, Lubricating, Ignition, Starting and Electrical systems. Study of constructional details, Adjustments & operating principles of these systems.

UNIT - 3 **L-06**

FUEL AND FUEL TEST: IC engine fuels -their properties and combustion of fuels, gasoline tests and their significance, diesel fuel tests and their significance, detonation and knocking in IC engines. Study of properties of coolants, anti freeze and anti corrosion materials. Lubricant types and study of their properties. Engine governing systems.

UNIT - 4 **L-06**

BIOMASS AND WIND ENERGY: Energy sources - Introduction, Classification, Energy from Biomass. Types of biogas plants, Constructional details, Principles of combustion, Pyrolysis and gasification, Types of gasifiers, Briquetting, Types of Briquetting machines, Wind energy, Types of wind mills, Constructional details and application of wind mills, Modern applications and future potential of renewable energy sources.

UNIT - 5 **L-06**

SOLAR ENERGY: Solar energy, Solar flat plate and focusing plate collectors, Solar air heaters, Solar space heating and cooling, Solar energy applications / Solar energy gadgets, Solar cookers, Solar water heating systems, Solar grain dryers, Solar Refrigeration system, Solar ponds, Solar photo voltaic systems, Solar lantern, Solar street lights, Solar fencing, Solar pumping systems.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Introduction to different systems of an CI engine; Engine parts and functions, working principles etc.
2. Valve system and Injection.
3. Air cleaning system and Fuel supply system of SI engine.
4. Cooling system and fan performance, thermostat and radiator performance evaluation.
5. Part load efficiencies & governing.
6. Lubricating system & adjustments.
7. Starting and electrical system and Ignition system.
8. Preparation of biomass sample and determination of calorific value.
9. Estimation of ash content, fixed carbon, volatile matter and moisture content of biomass.
10. Demonstration of down draft throat less and with throat rice husk gasifier.
11. Working of a fixed dome type and floating drum type biogas plants.
12. Biodiesel preparation.
13. Measurement of basic solar parameters and demonstration of solar water heater;

14. Demonstration of solar cooker

TEXT BOOK:

16HS202 PROBABILITY AND STATISTICS

Hours Per Week :

L	T	P	C
4	-	-	4

Total Hours :

L	T	P
60	-	-

CS	WA/RA	SSH	SA	S	BS
-	10	45	-	-	-

Course Description and Objectives:

This course deals with descriptive statistics, correlation and regression and their applications, probability, theoritical distributions and testing of hypothesis.

The objective of this course is to enable the student to understand and apply statitical techniques, curve fitting, correlation and regression, probability and also to make the student familiar with discrete, continuous distributions and testing of hypothesis.

Course Outcomes:

The student will be able to:

- distinguish between quantitative and categorical data and represent the data in graphical and tabular forms.
- calculate and interpret measures for the centre and spread of a data set.
- decide how and when to use the normal model.
- calculate and interpret correlation coefficient and regression lines.
- understand the rules of probability and apply them.
- compute probabilities using theoritical distributions.
- test hypothesis for population parameters.

UNIT - 1 **L- 12**

DESCRIPTIVE STATISTICS : Basic Definitions, Frequencies, Graphical Representation, Histogram, Ogive curves, Measures of Central tendency, Arithmetic mean, Median, Mode, mean deviation, standard deviation, Symmetry and Skewness, Karl Pearson's Coefficient of skewness.

UNIT - 2 **L- 12**

CURVE FITTING, CORRELATION AND REGRESSION : Least squares method, curve fitting (straight line and parabola only).Covariance, Correlation, Types, Pearson's Coefficient of correlation, Rank correlation, Spearman's rank correlation.Regression, Regression lines.

UNIT - 3 **L- 12**

PROBABILITY : Introduction, Definition (Classical and Axiomatic approach), Addition theorem, Conditional probability, Multiplication theorem, Total probability, Bayes theorem.

UNIT - 4 **L- 12**

DISTRIBUTIONS : Random variables, Discrete and Continuous variables, Introduction to Distributions *Binomial distribution :* Definition, Mean and Standard deviation, Recurrence relation, Applications, Fitting of binomial distribution.

Poisson Distribution *:* Definition, Mean and Standard deviation, Recurrence relation, Poisson Distribution is an approximation of Binomial distribution, Applications, Fitting of Poisson distribution.

Normal Distribution : Definition, Normal curve, Mean and Standard deviation, Median, Mode, Normal Distribution applications,

UNIT - 5 **L- 12**

TESTING OF HYPOTHESIS : Population and Sampling, Parameters and Statistics, Types of sampling~~.~~Test of hypothesis and test of significance: Null hypothesis, Errors, Level of significance, Confidence Limits, Testing large samples, Sample distribution of proportion~~,~~ t-distribution for small sample, difference between means of small sample, Chi square test for goodness of fit, Chi-square test for test of independence.

TEXT BOOKS:

16CE202 FLUID MECHANICS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	5

Course Description and objectives:

This course deals with the basic concepts of fluid flow, basic equations of continuity, energy and momentum. In addition, the course offers knowledge on various flow measuring devices. The objective of this course is to provide knowledge on basic properties of fluid in static and kinematic state and study of laminar and turbulent flow through pipes.

Course Outcomes:

Students will be able to:

- gain insights into properties of fluids like viscosity, density, specific weight etc,
- understand basic definitions related to fluids and fluid mechanics.
- measure pressure in fluid-flowing pipes and vessels.
- handle different kinds of pressure measuring instruments.
- apply continuity equation and energy equations in flow measurements.

SKILLS:

- ✓ *Differetiate between Newtonian and Non Newtonian fluids.*
- ✓ *Determine fluid pressure using different types of gauges.*
- ✓ *Determine hydrostatic forces on a body immersed in a fluid.*
- ✓ *Use flow measuring devices like pitot tube.*

UNIT - 1 **L-09**

FLUIDS: Definition, Ideal fluids, real fluids, Newtonian and non-Newtonian fluids.

PROPERTIES OF FLUIDS: Units of measurement, Mass density, Specific weight, Specific volume, Specific gravity, Viscosity, Surface tension and Capillarity, Compressibility and Elasticity.

MEASUREMENT OF PRESSURE: Pressure at a point in a static fluid; pressure variation in an incompressible static fluid; atmospheric pressure, Gauge pressure, vacuum pressure, absolute pressure, Manometers, Bourdon pressure gauge.

UNIT - 2 **L-09**

HYDROSTATIC FORCES: Forces acting on immersed plane surfaces, Center of pressure, forces on curved surfaces.

BUOYANCY: Conditions of equilibrium for floating bodies, meta-center and meta-centric height, experimental and analytical determination of meta-centric height.

UNIT - 3 **L-09**

FLUID KINEMATICS: Types of Flows, steady and unsteady flows, uniform and non-uniform flows, stream lines, path lines, stream tubes, Principles of conservation of mass, equation of continuity, acceleration of fluid particles: local and convective, rotational and irrotational motions, free and forced vortex, velocity potential and stream function, flow net.

FLUID DYNAMICS: Euler's equations of motion and integration of Euler's equations, Bernoulli's equation for incompressible fluids.

UNIT - 4 **L-09**

FLOW MEASURING DEVICES: Pitot tube, Venturimeter, Orifice meter, orifices and mouth pieces, time of emptying of tanks by orifices, sharp edged rectangular, triangular and trapezoidal notches, Francis formula, Velocity of approach, End contractions; Cippoletti Weir.

MOMENTUM EQUATION AND ITS APPLICATION: Development of momentum equation by control volume concept, Momentum correction factor, applications, forces on pipe bend.

UNIT - 5 **L-09**

ANALYSIS OF PIPE FLOW: Darcy's equation, Minor losses, pipes in series, pipes in parallel, total energy line and hydraulic gradient line, Hydraulic power transmission through a pipe, Siphon, Water hammer.

LAMINAR FLOW: Reynolds experiment, Characteristics of laminar flow, Steady laminar flow through a circular pipe (Hazen poiseuilles equation).

TURBULENT FLOW IN PIPES: Characteristics of turbulent flow, Prandtl's mixing length theory, Hydro dynamically smooth and rough boundaries, Velocity distribution, Friction factor for pipe flow, Variation of friction factor with Reynolds number, Moody's chart.

LABORATORY EXPERIMENTS

LIST OF EXPERMENTS Total hours: 30

1. Calibration of Venturimeter.
2. Calibration of Orifice meter.
3. Friction factor for a given pipe line.
4. Head loss due to sudden contraction in a pipeline

ACTIVITIES:

- *Measure weight and volume to calculate specific weight, mass density and specific gravity of various fluids like water, petrol, oil etc.*
- *Measure pressure at different points of a tank containing two or three immiscible liquids using a simple manometer.*
- *Prepare a model of hydraulic lift to demonsrate the concept of Pascal's law.*
- *Measure the depth of immersion of a floating object using the buoyancy principle.*

5. Verification of Bernoulli's equation
6. Coefficient of discharge of Mouthpiece
7. Coefficient of discharge of Orifice
8. Discharge by V-Notch
9. Discharge by Rectangular – Notch

TEXT BOOKS:

16AG203 PRINCIPLES OF THERMODYNAMICS

Hours Per Week :

L	T	P	C
2	-	2	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
30	-	30	2	40	2	8	2	2

Course Description and Objectives :

This course describes the theory and applications of classical thermodynamics, thermodynamic properties, equations of state and methods used to describe and predict phase equilibria. The objective of the course is to analyze and evaluate various thermodynamic cycles used for energy production - work and heat, within the natural limits of conversion.

Course Outcomes:

After completion of this course students will be able to:

- apply fundamental concepts of thermodynamics to engineering applications.
- define heat, work and thermal efficiency.
- differentiate between various forms of energy.
- estimate thermodynamic properties of substances in gas and liquid states.
- determine thermodynamic efficiency of various energy related processes.

SKILLS:

✓ *Comprehend different systems and basic laws of thermodynamics which are useful for engineering applications.*

✓ *Use entropy in different process and use of Carnot cycle/ theorem.*

✓ *Recognize different types of boilers and its use for different system according to working principle.*

✓ *Appreciate the effect of different parameters on steam generation.*

✓ *Use otto cycle and diesel cycle in steam engines.*

ACTIVITIES:

- *Development of layout of heat engine and heat pump by application of basic laws in live engineering models.*
- *Development of PVT profile for same engineering models (IC engine, Air condition system etc.)*
- *Modelling of energy requirement for different boilers with same capacity.*
- *Simulation of refrigeration system/ air conditioning*

UNIT - 1 **L-06**

INTRODUCTION AND BASIC LAWS : Thermodynamics properties, closed and open system, flow and non-flow processes, gas laws, laws of thermodynamics, internal energy. Application of first law in heating and expansion of gases in non-flow processes. First law applied to steady. Flow processes. Kelvin-Planck and Claussius statements.

UNIT - 2 **L-06**

ENTROPY AND PROCESSES Reversible processes, Carnot cycle, Carnot theorem. Entropy, physical concept of entropy, change of entropy of gases in thermodynamics processes. Difference between gas and vapor, change of phase during constant pressure process.

UNIT - 3 **L-06**

STEAM GENERATION : Generation of steam, triple point and critical point. Internal energy and entropy of steam. Use of steam tables and Mollier chart, heating and expansion of vapor in non-flow processes, measurement of dryness fraction.

UNIT - 4 **L-06**

BOILER : Classification of steam boilers, Cochran, Lancashire, locomotive and Babcock-Wilcox boilers. Boiler mountings and accessories. Desirable properties of working fluid used for power plants. Rankine cycle. Expansive and non-expansive working. Saturation curve and missing quantity, governing. Calculations of cylinder dimensions

UNIT - 5 **L-06**

STEAM ENGINES : Introduction to compound steam engines. Air Standard efficiency, other engine efficiencies and terms.Otto, diesel and dual cycles. Calculation of efficiency, mean effective pressure and their comparison. Measurement of IP, BP and .heat balance calculations (not involving combustion).Engine efficiencies and performance.

LABORATORY EXPERIMENT

LIST OF EXPERIMENTS **Time: 30hours**

1. Study of boilers.
2. Various mountings and accessories of boilers.
3. Study of steam engine.
4. To measure dryness fraction of steam.
5. Performance test of steam engine.
6. Study of I.C. engines.
7. Valve-timing diagram of 2-stroke engines.
8. Valve timing diagram of 4stroke engines.
9. Performance test on 2- cylinder diesel engines.
10. Performance test and heat balance test on a four cylinder horizontal diesel engine.
11. Comparison of different temperature measuring methods.

16AG204 SOIL MECHANICS

Hours Per Week :

L	T	P	C
2	1	2	4

Total Hours :

L	T	P
30	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	-

Course Description and Objectives:

This course deals with the relationships between physical characteristics and mechanical properties of soils. The objective of this course is to expose the students to the fundamental knowledge on soil physical parameters, permeability compaction, consolidation, earth pressure and stability of slopes.

Course Outcomes:

Upon successful completion of this course, the student should be able to:

- develop an understanding of the relationships between physical characteristics and mechanical properties of soils.
- understand and experience experimental measurement of the physical and mechanical soil properties commonly used in engineering practice.
- understand and experience shear test of soil.
- apply engineering science principles, using shear strength and compressibility parameters, to analyze the response of soil under external loading.

SKILLS:

✓ *Determine soil moisture content, bulk density, soil texture value, and classify soil .*

✓ *Test soil compaction, consolidation and strength for different places.*

✓ *Perform Sieve analysis test.*

✓ *Find the response of soil under external loading principles, using shear strength and compressibility parameters.*

✓ *Prepare and present soil characteristics curve for different locations.*

ACTIVITIES:

- *Perform different soil parameters laboratory test, taking soil sample, handling balancer, drier, chemical experiment, analysis of charts, tables, graphs.*
- *Preparation of soil sample and perform compaction test consolidation and strength test and results analysis for different types of soil.*
- *Classify soil based on analysis of different soil properties.*
- *Differentiate soil characteristics based on analysis of soil test results.*

UNIT- 1 **L-06,T-03**

INTRODUCTION OF SOIL MECHANICS : Intruction of soil mechanics, field of soil mechanics, phase diagram, physical and index properties of soil, Classification of soils, general classification based on particles size, textural classification and I.S. soil classification system. Stress condition in soils, effective and neutral stress, elementary concept of Bousinesque and Wester guards analysis, new mark influence chart.

UNIT- 2 **L-06,T-03**

SHEAR STRENGTH : Mohr stress circle, theoretical relationship between principle stress circles, theoretical relationship between principal stress Mohr-coulomb failure theory, effective stress principle. Determination of shear parameters by direct shear to be circle, theoretical test. Numerical exercise based on various types of tests.

UNIT- 3 **L-06,T-03**

COMPACTION AND CONSOLIDATION : Compaction, composition of soils standard and modified Proctor test, Abbot compaction and Jodhpur mini compaction text field compaction method and control. Consolidation of soil: one dimensional consolidation spring analogy, Terzaghi's theory, Laboratory consolidation test, calculation of void ratio and coefficient of volume change, Taylor's and Casagrande method, determination of coefficient of consolidation.

UNIT- 4 **L-06,T-03**

EARTH PRESSURE : Plastic equilibrium in soils, active and passive states, Rankine's theory of earth pressure, active and passive earth pressure for cohesive soils, simple numerical exercise.

UNIT- 5 **L-06,T-03**

STABILITY OF SLOPES : Introduction to stability analysis of infinite and finite slopes, friction circles method, Taylor's stability number.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS **Total hours: 30**

1. Determination of water content of soil.
2. Determination of specific gravity of soil.
3. Field density of soil: core cutter method.
4. Field density: sand replacement method.
5. Grain size analysis: sieving (Dry sieve analysis).
6. Grain size analysis: hydrometer method.
7. Liquid limit: Casagrande's method.
8. Liquid limit: cone penetrometer and plastic limit.
9. Shrinkage limit.
10. Permeability: constant head method.
11. Permeability: variable head method.
12. Compaction properties: standard proctor test.
13. Shear parameters: direct shear test.
14. Unconfined compressive strength of soil.

15. Shear parameters :Tri-axial test.

16. Consolidation properties of soils.

16EL102 SOFT SKILLS LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The Soft Skills Laboratory course is aimed at training undergraduate students on employability skills. Designed to impart work related skills, the course will enable trainees to develop interpersonal communication, leadership, Preparing Resume, Group Discussion, and Interview Skills. It will give them the required competence and confidence to handle professional tasks.

Course Outcomes:

The student will be able to :

- formulate mathematical models of physical systems and represent them in block diagrams and signal flow graphs equip with requisite professional and inter-personal skills.
- they will possess the ability to think critically on issues for informed decision making and know how to communicate effectively through choice of appropriate language and speech, while dealing with others at the workplace.
- through identification and introspection on individual strengths and weaknesses.
- students will emerge with improved levels of self-awareness and self-worth, for greater efficacy at workplace.

SKILLS:

✓ *Able to Communicate and understand the difference between soft skills an hard skills.*

✓ *Able to learn professionalism and Employability skills.*

✓ *Able to plan Career by drawing their SWOT, Setting the Goal, learn the importance of Time and Stress Management.*

✓ *Able to learn Vocabulary, Situational English, Group Discussion, Reading Comprehension and Listening Comprehension which are essential for all competitive examinations.*

✓ *Able to prepare Resume and learn how to face interview.*

✓ *Able to learn Gender sensitive language, Good manners, emotional intelligence and essential skills.*

UNIT - 1 **P-08**

A) COMMUNICATION: Need for effective communication - the process of communication, levels of communication, flow of communication, choice of diction and style with reference to setting (formal, semi-formal or informal); communication networks, barriers to communication, miscommunication, noise and ways to overcome the barriers.

B) SOFT SKILLS: Difference between soft and hard skills, need for soft skills, professionalism, employability skills

C) CAREER PLANNING:

Job vs. career, Goal setting, SWOT analysis, planning and prioritization, four quadrant time management system, self-management, stress-management.

ACTIVITY: Johari Window for SWOT analysis; Setting a SMART goal using the provided grid; Writing a Statement of Purpose (SOP).

UNIT - 2 **P-08**

A) VOCABULARY BUILDING: Word etymology, roots, prefixes & suffixes, synonyms & antonyms, collocations, one-word substitutes, analogies, idioms and phrases, contextual guessing of unfamiliar words, task-oriented learning (50 words).

ACTIVITY: Making a flash card (one per day by each student) – vocabulary exercises with hand-outs – Vocabulary quiz (evaluation will be a combination of the 50 words provided by the instructor and the flash cards made by the student (one per day)

B) FUNCTIONAL ENGLISH: Situational dialogues, Role plays (including small talk), Self introduction, Opening and closing a telephonic conversation, Making an appointment, Making a query, Offering/ Passing on information, Communicating with superiors, Expressing agreement/objection, Opening bank account (combination of prepared and impromptu situations given to each student)

C) GROUP DISCUSSION: Articulation and flow of oral presentation, dynamics of group discussion, intervention, summarizing and conclusion, voice modulation, content generation, Key Word Approach (KWA), Social, Political, Economic, Legal and Technical Approach (SPELT), View Point of Affected Part (VAP), language relevance, fluency and coherence.

ACTIVITY: Viewing a recorded video of GD & Mock sessions on different types of GD topics- controversial, knowledge, case study (including topics on current affairs)

UNIT - 3 **P-04**

A) RESUME-WRITING: Structure and presentation, defining career objective, projecting one's strengths and skill-sets, summarizing, formats and styles and covering letter.

ACTIVITY: Appraising some samples of good and bad resumes, preparing the resume, writing an effective covering letter.

B) FACING INTERVIEWS: Interview process, understanding employer expectations, pre-interview planning, opening strategies, impressive self-introduction, answering strategies, other critical aspects such as body language, grooming, other types of interviews such as stress-based interviews, tele-interviews, video interviews, frequently asked questions (FAQs) including Behavioural and HR questions and the aspect looked at by corporate during interviews

ACTIVITY: Writing responses and practicing through role plays and mock interviews on the FAQs including feedback.

UNIT - 4 **P-04**

A) READING COMPREHENSION: Reading as a skill, techniques for speed reading, understanding the tone, skimming and scanning, appreciating stylistics, impediments for speed reading, eye fixation,

ACTIVITIES:

- *Formal and informal communication.*
- *SWOT analysis.*
- *Stephen covey Time Management matrix.*
- *Stress Management techniques.*
- *Vocabulary flash cards.*
- *Situational Dialogues.*
- *Group Discussion.*
- *Resume preparation.*
- *Mock Interview.*
- *Reading comprehension activities.*
- *Listening comprehension Activity by watching the American accent video.*
- *Emotional intelligence, etiquette quiz.*

sub-vocalization, critical reading, reading based on purpose, reading for information, reading for inference.

ACTIVITY: Reading comprehension exercises with texts drawn from diverse subject areas. (Hand-outs). Newspaper activity with students divided into 4 groups. Each group looks at critical component of communication such as Listening, Speaking, Reading and Writing enabling them to be better communicators as well as be more aware about the current affairs, which help in Group Discussion.

B) LISTENING COMPREHENSION: Listening as a skill, different types of listening, active and passive listening, top-down approach, bottom-up approach, understanding the non verbal cues of communication; intonation and stress.

ACTIVITY: Narration of a story, Speech excerpts with different accents (Indian, British, American), listening comprehension exercises with audio and video excerpts.

UNIT - V 5 **P-06**

IMPACT OF LANGUAGE ON PERSONALITY: Gender sensitive language in MNCs, cultural sensitivity, social awareness, emotional intelligence, good manners, self-grooming, positive body language, accepting and handling responsibility, assertiveness, problem solving, negotiating skills, networking and creating a good first impression.

Seven essential skills for a team player; attentive listening, intelligent questioning, gently persuading, respecting other's views, assisting others, sharing, participating actively.

ACTIVITY: Johari Window, Games and Case studies.

16AG205 CROP PRODUCTION TECHNOLOGY

Hours Per Week :

L	T	P	C
2	-	2	3

Total Hours :

L	T	P
30	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	5	6	-

Course Description and Objectives:

This course describes the various types of soil and its properties for better production of crops and horticulture of crops. The objective of this course is to understand different types of soils and its properties with production of different agriculture as well as horticultural plants.

Course Outcomes:

After completion of this course students will be able to:

- about drying and storage of farm crops.
- of use of different production techniques for different crops.

SKILLS:

✓ *Understand the basic classification of crops and their tillage characteristics.*

✓ *Understand Criteria for site selection, layout and planting methods, nursery raising, macro and micro propagation methods.*

✓ *Knowledge to handle Garden tools, management of orchard.*

✓ *Information regarding extraction and storage of vegetables seeds.*

ACTIVITIES:

- o *Identification of rocks and minerals.*
- o *Determination of bulk density, particle density and porosity of soil.*
- o *Determination of organic carbon of soil.*
- o *Identification of crops and their varieties seeds and weeds.*
- o *Nutrient requirement and fertilizer requirement recommendation for different crops.*

UNIT - 1 **L-06**

SOIL PHYSICS: Soils: Nature and origin of soil; soil forming rocks and minerals, their classification and composition, soil forming processes. Classification of soils, soil taxonomy orders; important soil physical properties, soil particle distribution.

UNIT - 2 **L-06**

SOIL CHEMISTRY: Soil inorganic colloids - their composition, properties and origin of charge; ion exchange in soil and nutrient availability; soil organic matter - its composition and decomposition, effect on soil fertility; soil reaction - acid, saline and sodic soils; quality or irrigation water; essential plants nutrients - their functions and deficiency symptoms in plants; important inorganic fertilizers and their reactions in soils.

UNIT - 3 **L-06**

AGRONOMY: Definition and scope of agronomy. Classification of crops, Effect of different weather parameters on crop growth and development. Principles of tillage, tilth and its characteristics. Soil water plant relationship and water requirement of crops, weeds and their control, crop rotation, cropping systems, Relay cropping and mixed cropping.

UNIT - 4 **L-06**

HORTICULTURE-1: Scope of horticultural and vegetable crops. Soil and climatic requirements for fruits, vegetables and floriculture crops, improved varieties, Criteria for site selection, layout and planting methods, nursery raising, macro and micro propagation methods, plant growing structures.

UNIT - 5 **L-06**

HORTICULTURE-2: Pruning and training, Fertilizer application, fertigation, Irrigation methods, Harvesting, Grading and packaging, Post harvest practices, Garden tools, Management of orchard, Extraction and storage of vegetables seeds.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS **Total hours: 30**

1. Identification of rocks and minerals.
2. Examination of soil profile in the field.
3. Determination of bulk density, particle density and porosity of soil.
4. Determination of organic carbon of soil.
5. Identification of crops and their varieties seeds and weeds.
6. Fertilizer application methods.
7. Different weed control methods.
8. Judging maturity time for harvesting of crop.
9. Study of seed viability and germination test.
10. Identification and description of important fruit, flowers and vegetables crops.
11. Study of different garden tools.
12. Preparation of nursery bed.
13. Practices of pruning and training in some important fruit crops.

TEXT BOOKS:

1. ICAR, “Hand Book of Agriculture”. ICAR Publication, New Delhi, 2011.
2. J. M. Martin and W. H. Leonard, “Principles of Field crop production”. Macmillon Publishing Co. Inc. New York, 1976.

REFERENCE BOOKS:

16AG206 STRENGTH OF MATERIALS

Hours Per Week :

L	T	P	C
2	-	2	3

Total Hours :

L	T	P
30	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	-

Course Description and Objectives:

This course describes concepts of mechanics of deformable solids including static equilibrium, geometry of deformation and material constitutive behaviour. Objective of the course is to provide students with exposure to the systematic methods for solving engineering problems in solid mechanics. It also discuss the basic mechanical principles underlying modern approaches for design of various types of structural members subjected to axial load, torsion, bending, transverse shear, and combined loading.

Course Outcomes:

Upon successful completion of this course, the student should be able to:

- understand the concepts of stress and strain at a point as well as the stress-strain relationships for homogenous, isotropic materials.
- establish relation between shear load and shear force and draw shear force and bending moment diagram.
- derive flexural formula for simple bending and able to calculate variation shear stress-shear stress distribution for various cross sections.
- calculate the stresses and strains associated with thin-wall spherical and cylindrical pressure vessels.
- determine the deflections and rotations produced by the three fundamental types of loads: axial, torsional, and flexural.

SKILLS:

✓ *Measure tensile and compressive strength of materials using UTM.*

✓ *Measure shear strength of materials.*

✓ *Determine deflections produced by axial, torsional and flexural loads.*

ACTIVITIES:

- *Measurement of tensile, compressive and shear strength of materials.*
- *Design of cantilever beam.*
- *Design of simply supported and overhanging beams.*

UNIT - 1 **L-05**

SIMPLE TRESSES AND STRAINS : Types of Stresses and Strains-Hooke's law-Stress strain diagram for ductile and Brittle materials, salient points. Elastic Constants – relations strain energy, Simple and compound bars. Thermal Stresses-Stress on an inclined plane, principle stresses – Mohr circle. Strain Energy-Resilience-Gradual, Sudden, Impact and Shock loadings.

UNIT - 2 **L-06**

SHEAR FORCE AND BENDING MOMENT : Types of loads and beams-Relation between shear load, shear force and bending moment-Shear force and bending moment diagrams – Cantilevers – Simply supported beams and over-hanging beams subjected to point loads, UDL and Uniformly varying loads-Point of contra flexure.

Deflection of Beams:Introduction-deflection equation for elastic curve of a beam– deflection, slope for cantilever beam and simply supported beams – point loads, UDL and uniformly varying loads. Double integration method - Macaulay's method – Area moment methods.

UNIT - 3 **L-06**

FLEXURE AND SHEAR STRESSE : Theory of simple bending – Assumptions – Flexural formula – Bending stresses in beams for various cross sections. Shear stresses in beams – Assumptions – Derivation for variation of shear stress – shear stress distribution for various cross-sections.

UNIT - 4 **L-06**

TORSION : Introduction – Torsion equation – shear stress distribution for circular solid and hollow shafts – Stepped shafts –Shafts fixed at both the ends.

UNIT - 5 **L-07**

THIN CYLINDRICAL SHELLS : Introduction – hoop and longitudinal stresses – strains – thin spherical shell - stresses. Columns and Struts: Introduction, Euler's Formula for critical load of columns for different end conditions, Limitations of Euler's theory, Rankine's formula, Simple Numerical.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS. **Total hours: 30**

1. Direct tension test
2. Bending test on

   a) Simply supported beam b) Cantilever beam
3. Torsion test
4. Hardness test

   a) Brinell hardness test b) Rockwell hardness test
5. Test on springs.
6. Compression test on cube.
7. Impact test.

16AG207 SURVEYING AND LEVELLING

Hours Per Week :

L	T	P	C
1	-	3	3

Total Hours :

L	T	P
15	-	45

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	-

Course Description and Objectives:

This course deals with the various methods employed for the measurement of distances, areas and volumes and also deals with the marking positions of the proposed structures on the ground by using various surveying techniques. The objective of this course is to learn the basic levelling principles, theory and applications and make students to be able to book and reduce levelling data.

Course Outcomes:

Upon successful completion of this course, the student should be able to:

- understand the basic principles of surveying and levelling.
- apply the basic principles of surveying and levelling on agriculture structures.
- measure all the land measurements including horizontal distances, angles, elevations,and areas with chain, compass, and levelling instruments.
- measure the horizontal and vertical angles to simplify the calculations involving in height and distance measurements of inaccessible points.
- construct closed and open traverses for the finding out the land areas in large scales using Theodolites.

SKILLS:

- ✓ *Finding the length between two stations and areas an iruugular field.*
- ✓ *Performing chaining and ranging where different types of obstructions are present.*
- ✓ *Take offsets (Perpendicular and Oblique) in different filed conditions.*
- ✓ *Finding latitude and longitude of area using GPS system.*
- ✓ *Determining bearings of different survey lines by using Prismatic Compass.*
- ✓ *Setting plane table by different orientation methods on given survey station.*

ACTIVITIES:

- *Handling different types of survey chains, ranging rods, metallic tape, prismatic compass, and cross staff.*
- *Determining included angles from measured bearings.*
- *Finding location of an area using precised GPS system.*
- *Performing contour survey of an area and preparation of contour map.*
- *Projecting Plane Table Survey: Prepare map of open vacant land using any plane table method.*

UNIT - 1 **L- 03**

INTRODUCTION : Definitions of surveying and levelling, Branches and classification of surveying, Principles of surveying, Accuracy and precision.

LINEAR MEASUREMENTS : Instruments, Methods of measurements; on level ground, on slope and across obstacles, setting out parallels and perpendiculars, Errors, mistakes and corrections in linear measurements.

CHAIN SURVEYING : Introduction, Principle and purpose of chain surveying, Field work and plotting work procedures, Accuracy in chain surveying.

UNIT - 2 **L- 03**

LEVELLING : Definition of levelling, Principles of ordinary levelling and terms used in levelling, Equipment used in levelling and Types of levels, Temporary and Permanent adjustments, Series/ Reciprocal levelling, Methods of booking levels, Use of levelling, Errors in levelling.

COMPASS SURVEYING : Systems of designating bearings, Compass and its parts, Open and closed traverses, Compass traverse: field work and office work procedures, Accuracy of compass traversing.

UNIT - 3 **L- 03**

THEODOLITE TRAVERSING : Introduction to Theodolite, Classification of Theodolites, Parts of the Theodolite and temporary adjustments, Permanent adjustments of Theodolite, Measurements of horizontal and vertical angles, Methods of Traversing, Traverse computations, Errors in Traversing and Precautions.

CONTOURING : Characteristics of contours, Use of contour maps, Methods of contouring.

UNIT - 4 **L- 03**

PLANE TABLE SURVEYING : Plane table and accessories, Methods of plane table surveying, Contouring with Indian clinometers, Uses of Plane table surveying, Advantages & disadvantages of plane table surveying, Errors in plane table surveying.

AREAS AND VOLUMES : Computation of areas from plotted plan, Computation of areas from field notes, Volumes of a prismoid by Trapezoidal and Simpson's rule.

UNIT - 5 **L- 03**

GLOBAL POSITIONING SYSTEMS (GPS) : Introduction to GPS, Maps and types of digital map, Fundamentals of GPS, Uses of GPS, GPS Receivers (Hand held GPS receivers), Field procedures of GPS.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS **Total hours: 45**

1. Chain surveying.
2. Cross staff survey.
3. Compass traversing.
4. Differential levelling.

5. Reciprocal levelling method.
6. Profile levelling.
7. Plane table traversing.
8. Plane table intersection.
9. Theodolite surveying.
10. Global Positioning System (GPS).

TEXT BOOKS:

1. B. C. Punmia, “Surveying: Volume I and II”, Laxmi Publishers, 15th Edition, 2005.
2. T. P. Kanetkar and S. V. Kulkarni, “Surveying and levelling Vol-I”, Puna Vidyarthi Griha Prakashan Publication, 1986.

16AG208 THEORY OF MACHINES

Hours Per Week :

L	T	P	C
2	-	2	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
30	-	30	5	40	5	8	5	-

Course Description and Objectives:

The course describes the anatomy of mechanisms, machine elements and their response to static and dynamic forces. The objectives of the course are to Introduce the approaches and mathematical models used in kinematic and dynamic analysis of machinery, and to give basic knowledge on kinematic and dynamic design of machinery. It also impart the basic knowledge on mechanical vibrations.

Course Outcomes:

Upon successful completion of this course, the students should be able to:

- identify common mechanisms used in machines and everyday life.
- calculate mobility (number of degrees-of-freedom).
- conduct a complete (translational and rotational) velocity, acceleration analysis of the mechanism.
- understand gear mechanism, classification and to become familiar with gear standardization and specification in design.
- do static and dynamic force analysis and balancing of masses.
- understand the types of vibrations developed during functioning of any mechanical system.

SKILLS:

✓ *Identify common mechanisms used in machines.*

✓ *Simulate different mechanisms using software.*

✓ *Measure vibrations in different mechanisms.*

✓ *Determine degree of freedom for mechanisms.*

UNIT - 1 **L- 05**

INTRODUCTION TO MECHNISMS : Links, classifications of links, kinematic pairs - lower pairs , higher pairs, kinematic chain-inversion-four bar chain and slider crank mechanisms, Determination of Degree of freedom of simple mechanisms. Straight line motion mechanisms: Classification of straight line motion mechanisms-Peaucellier's, Tchebicheff's and pantograph mechanisms.

UNIT - 2 **L-07**

VELOCITY AND ACCELERATION IN MECHNISMS : Motion of a link in machine, velocity of a point on a link – Instantaneous center – types of instantaneous centers – Kennedy's theorem – velocity measurement by instantaneous center method, relative velocity method. Acceleration of a point on a link - acceleration in slider crank mechanism, Coriolis component of acceleration.

UNIT - 3 **L-06**

GEARS AND GEAR TRAINS : Introduction, friction wheels toothed gearing-types of gears-law of gearing-condition for constant velocity ratio for transmission-form of teeth, cycloidal and involute profiles-phenomena of interferences-condition for minimum number of teeth to avoid interference-expression for arc of contact and path of contact. Introduction to gear train-train value-simple, compound, reverted and -epicyclic gear train - method to find gear train value.

UNIT - 4 **L-06**

BALANCING : Balancing of rotating masses-primary, secondary balancing ,balancing of reciprocating masses, analytical and graphical methods - unbalanced forces and couples - hammer blow, swaying couple, variation of tractive effort.

UNIT - 5 **L-06**

MECHANICAL VIBRATION : Basic Concepts – types of vibrations - determination of natural frequency of simple systems - vibrations of beams due to point loads- Dunkerley's method-Rayleigh's method - Forced and damped vibrations - vibration isolation and transmissibility. Whirling of shafts, critical speeds - torsional vibrations of two and three rotor systems.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Characteristics of four bar mechanism.
2. Variation in velocity and acceleration of the slider crank mechanism.
3. Dynamic balancing of the rotating mass system.
4. Study of the free vibration and determination of natural frequency of vibration of Two- Rotor system.
5. Longitudinal and torsional vibration and determination of natural frequency vibration of single rotor system.
6. Study of damped torsional vibration and determination of damping coefficient.
7. Verification of the relation T = 2p "l/g for a simple pendulum.
8. Determination of whirling speed of shafts.

TEXT BOOKS:

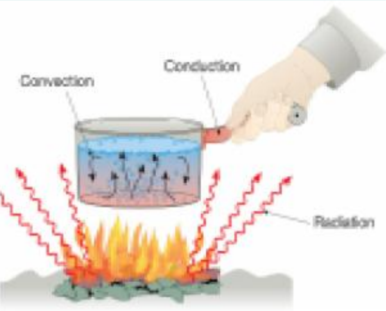
2. http://nptel.ac.in/courses/112101096/
3. http://ecoursesonline.iasri.res.in/course/view.php?id=37

ACTIVITIES:

- *Prototypes of different straight line motion mechanisms.*
- *Simulation of different mechanisms*
- *Design of quick return motion mechanism for given inputs.*
- *Measurement and analysis of vibration in different systems.*



16AG425 PRINCIPLES OF HEAT AND MASS TRANSFER

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
2	40	4	8	2	-

Course Description and Objectives:

This course elaborates the basics of heat and mass transfer properties of material and applications of different heat transfer processes in different food engineering aspects.This course is designed to analyze heat as well as mass transfer phenomenon takes place during food processing.

Course Outcomes:

After completion of this course, the student would be able to:

- apply principles of heat and mass transfer to basic engineering systems.
- analyze heat transfer by conduction, convection and radiation.
- analyze and design heat exchangers.
- analyze diffusional processes and calculate the flux in a diffusion process during mass transfer.
- analyze heat as well mass transfer taking place during different unit operations like drying, evaporation, distillation.

SKILLS:

- ✓ Understand different thermal properties like thermal conductivity, specific heat, thermal diffusivity for different food material.
- ✓ Understand measurement of different thermal properties.
- ✓ Understand basic principles of conduction, convection and radiation.
- ✓ Recognize different types of fins and identify its application in food industry.
- ✓ Understand critical thickness of insulation and identify its use in cold storage design.
- ✓ Understand different types of heat exchanger and design it according to its effectiveness.
- ✓ Understand diffusion of mass during different unit operations like drying, evaporation, distillation.

UNIT - 1 **L-10,T-04**

BASICS AND CONDUCTION HEAT TRANSFER: Introductory concepts, modes of heat transfer, thermal conductivity of materials, measurement. General differential equation of conduction.One dimensional steady state conduction through plane and composite walls, tubes and spheres with and without heat generation.Electrical analogy.

UNIT - 2 **L-10,T-03**

INSULATION AND CONVECTION HEAT TRANSFER: Insulation materials, critical thickness of insulation. Fins, Free and forced convection. Newton's law of cooling, heat transfer coefficient in convection. Dimensional analysis of free and forced convection.Useful non dimensional numbers and empirical relationships for free and forced convection.Equation of laminar boundary layer on flat plate and in a tube. Laminar forced convection on a flat plate and in a tube. Combined free and forced convection.

UNIT - 3 **L-10,T-03**

RADIATION HEAT TRANSFER: Absorptivity, reflectivity and transmissivity of radiation. Black body and monochromatic radiation, Planck' s law, Stefan-Boltzman law, Kirchoff' s law, grey bodies and emissive power, solid angle, intensity of radiation. Radiation exchange between black surfaces, geometric configuration factor.

UNIT - 4 **L-08,T-03**

HEAT EXCHANGERS: Types of heat exchangers, fouling factor, log mean temperature difference, heat exchanger performance, transfer units. Heat exchanger analysis restricted to parallel and counter flow heat exchangers

UNIT - 5 **L-07,T-02**

MASS TRANSFER: Steady state molecular diffusion in fluids at rest and in laminar flow, Flick's law, mass transfer coefficients. Reynold's analogy.

TEXT BOOKS:

1. http://nptel.ac.in/courses/112108149/
2. http://ecoursesonline.iasri.res.in/course/view.php?id=61

ACTIVITIES:

- *Development of apparatus for measurement of thermal conductivity of different food material.*
- *Development of apparatus for measurement of specific heat/ heat capacity of different food material.*
- *Simulationof conduction, convection, radiation at basic level.*
- *Design of effective heat exchanger for maximum economic u se.*
- *Calculation of refrigeration load on cold storage with and without insulation.*
- *Calculation of thickness of insulation for different rural level cold storages with different capacity for different food products.*
- *Modelling of mass transfer during tray drying of different food material.*

16HS203 PROFESSIONAL COMMUNICATION

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	42	6	12	3	2

Course Description and Objectives:

The Professional Communication Laboratory course is aimed at improving professional communication skills (LSRW – Listening, Speaking, Reading and Writing) of undergraduate students and preparing them for their profession as engineers and managers. This course will help students to understand professional communication and personality as two interlinked spheres of influence, and provide them with exposure to conventions of corporate communication involved in the functioning of the business world.

Course Outcomes:

Students will be able to:

- having gone through the course, students would be equipped to clear industry recognized certification such as BEC Vantage by the University of Cambridge.
- this will equip them to stand out both in the professional setting as well as for further pursuits in the academic world.
- Since this certification looks at LSRW (Listening, Speaking, Reading and Writing) components in great detail, we hope to equip students to confidently and successfully attempt all the 4 critical components.

SKILLS:

- ✓ *Able to understand and use grammar rules in writing; sentences, paragraphs, paraphrasing,*
- ✓ *Able to write business emails, memos, letters, reports and proposals*
- ✓ *Able to comprehend business articles, and documents*
- ✓ *Able to use expressions in Professional context, and acquire presentation skills like one minute talk and pair discussion in professional context*
- ✓ *Able to familiarize and comprehend British accent by listening to recorded speeches and discussions.*

UNIT – 1 **P-06**

BUSINESS ENGLISH VOCABULARY: Glossary of most commonly used words (formal and informal usage) **Elements of Technical Writing**: Sentence structure, reducing verbosity, arranging ideas logically, building coherence, paragraph level and document level, topic sentence, cohesive devices, transitional words, paraphrasing and précis-writing. **Mechanics of Writing:** Stylistic elements, the rapporteur, the purpose, the reader's viewpoint (audience), elementary rules of grammar, choice of diction, elementary principles of composition, matters of form, punctuation, conventions of business communication, language and professional tone, weak links in business correspondence, ethical concerns in business writing, code of conduct (not sending illegal, offensive, disparaging personal remarks or comments) in written business communication

UNIT – II **P-06**

BUSINESS CORRESPONDENCE: E-mail: nature and scope, e-mail etiquette, clear call for action, common errors in composing e-mails, office communication such as meeting agenda and minutes of the meeting, notice, circular and memo

Letter-Writing: Formal and informal letters, structure of formal letters, expressions of salutations, different types of letters [such as sales letter, complaint letter, response to the complaint letter (dispute resolution), letter of permission, letter of enquiring, claim letter – letter of apology etc], introductory and concluding paragraphs and clear call for action.

PROFESSIONAL PROPOSAL/REPORT: Differentiating proposals and reports, Drafting formal business proposals, types of reports such as factual reports, feasibility reports and survey reports, parts ofa report (such as title page, declaration, acknowledgements, table of contents, abstract, introduction, findings, conclusion and recommendations, citations, references and appendices)

UNIT-III **P-06**

SPEAKING: Speaking in business context, assertiveness, politeness, making requests, queries and questions, negotiations, asking for information, offering suggestions, conflict resolution, contacting clients, initiating, addressing delegates (in public), features of a good power point presentation (making the PPT), delivering the presentation effectively, telephone etiquettes, delivering seminar/proposal/ report effectively, team meeting etiquettes (face to face and conference call), making effective one minute presentations

UNIT-IV **P-06**

READING: Reading and comprehending business documents, learning business register, regularizing the habit of reading business news, suitable vocabulary, skimming and scanning text for effective and speedy reading and dealing with ideas from different sectors of corporate world in different business contexts.

UNIT-V **P-06**

LISTENING: Specific information in business context, listening to telephonic conversations/messages and understanding the correct intended meaning, understanding the questions asked in interviews or in professional settings, summarizing speaker's opinion or suggestion, enable active listening

TEXT BOOKS: BEC

1. Guy Brook Hart (2014): Cambridge English Business Bench Mark: Upper Intermediate, Second Edition: CUP.
2. CUP (2002) Cambridge: BEC VANTAGE: Practice Tests, CUP

ONLINE REFERENCES:

1. http://www.cambridgeenglish.org/exams/business-certificates/business vantage/ preparation/
2. https://www.youtube.com/watch?v=qxFtn9pGaTI

ACTIVITIES:

- *Basic grammar practice, Framing paragraphs on topics allocated,*
- *Paraphrasing an article or a video in your own words Finding topic sentences in newspaper articles*
- *Finding out new words from a professional viewpoint Understanding the meaning and its usage*
- *Perusing samples of well prepared proposals and reports*
- *Draft different proposals/reports on topics assigned.*
- *Watching videos/ listening to audios of business presentations*
- *Classroom activities of team and individual presentations*
- *Using PPTs, mock exercises for BEC speaking.*
- *Presenting (speaking) the written components completed in Unit 1*
- *Hand-outs; matching the statements with texts.*
- *Finding missing appropriate sentence in the text from multiple choice, multiple choices*
- *Using right vocabulary as per the given context and editing a paragraph.*

III Year - B.Tech

SYLLABUS

I SEM & II SEM

III Year I Semester

L	T	P	To	C
3	1	-	4	4

AG301 Machine Design

Course Description & Objectives:

To familiarize students with various steps involved in the design process and to make them understand the principles involved in evaluating the shape and dimensions of a component to satisfy functional and strength requirements.

Course Outcomes:

By completing this course, the students will have the ability to:

1. *design the components against static loading.*
2. *design the components against cyclic loading.*
3. *design the fasteners like rivets, bolts and cotter joints.*
4. *design power transmission shafts and couplings*
5. *calculate stress and load along with deformations of various types of springs*

Unit I: Steady Stresses and Variable Stresses in Machine Members:

Introduction to the design process - factors influencing machine design, selection of materials based on mechanical properties – Direct, Bending and Torsional stress equations.

Unit II: Design of Shafts and Couplings and Design of Fastners and Welded Joints:

Design of solid and hollow shafts based on strength, rigidity and critical speed, Design of keys and key ways - Design of rigid and flexible couplings design of knuckle joints.

Threaded fasteners, Design of bolted joints including eccentric loading, Design of welded joints for pressure vessels and structures, theory of bonded joints.

Unit III: Design of Springs and Bearings:

Design of helical, leaf, disc and torsional springs under constant loads. Design of bearings, sliding contact and rolling contact types, Cubic mean load, Design of journal bearings, Lubrication in journal bearings, Calculation of bearing dimensions.

Unit IV: Thin Cylinders & Thick Cylinders, Clutches & Brakes:

Design principles, Stresses due to internal and external pressures, Design methodology for enhanced pressure. Design of Clutches: Single plate, multi plate and cone clutches. Design of Brakes: Block and Band brakes: Self locking of brakes.

Unit V: Spur & Helical Gears:

Spur Gears: Definitions, stresses in gear tooth, Lewis equation and form factor, Design for strength. Helical Gears: Definitions, formative number of teeth, Design based on strength.

TEXT BOOKS:

III Year I Semester

L	T	P	To	C
3	1	-	4	4

AG303 Farm Machinery and Equipment

Course Description & Objectives:

To study the different machinery used for various agricultural operations and to understand the basics of designing and maintaining the same.

Course Outcomes:

The students will have emphasis on:

1. *Necessities of farm mechanization.*
2. *Usage of tillage, plant protection, harvesting machines.*
3. *Testing procedures and ergonomics of machines.*
4. *Uses of different machines for different purposes in the farm.*

Unit I: Farm Mechanization:

Objectives of farm mechanization. Classification of farm machines. Materials of construction & heat treatment. Principles of operation and selection of machines used for production of crops. Field capacities & economics.

Unit II: Tillage and Equipments:

Tillage; primary and secondary tillage equipment. Forces acting on tillage tools. Field operation patterns. Draft measurement of tillage equipment: Earth moving equipment their construction & working principles viz Bulldozer, Trencher, Excavators etc.; sowing, planting & transplanting equipment their calibration and adjustments.

Unit III: Plant protection Equipments:

Fertilizer application equipment. Weed control and Plant protection equipment sprayers and dusters, their calibration, selection, constructional features of different components and adjustments. Work physiology of men and women.

Unit IV: Harvesters:

Principles & types of cutting mechanisms. Construction & adjustments of shear &impact type cutting mechanisms. Crop harvesting machinery: mowers, windrowers, reapers, reaper binders and forage harvesters. Forage chopping & handling equipment. Threshing mechanics & various types of threshers. Threshers, straw combines & grain combines, maize harvesting & shelling equipment, Root crop harvesting equipment potato, groundnut etc., Cotton picking & Sugarcane harvesting equipment.

Unit V: Testing & Selection of machines:

Principles of plantation crops and fruit harvesting tools and machines. Horticultural tools and gadgets. Testing of farm machine. Test codes & procedure. Interpretation of test results. Selection and management of farm machines for optimum performance. Workplace layout for men and women.

AG305 Ground Water, Wells and Pumps

Course Description & Objectives:

To study the mechanics of water storage and to understand the design and maintenance of pumps.

Course Outcomes:

At the end of course students will have:

1. *basic knowledge on different types of wells and pumps.*
2. *knowledge to acquire modelling and uses of different methods used for estimation of ground water potential.*

Unit I: Groundwater and Wells:

Occurrence and movement of ground water, aquifer and its types, classification of wells, steady and transient flow into partially, fully and non penetrating tube wells and open wells, familiarization of various types of bore wells common in the State

Unit II: Design of Wells:

Design of open well, groundwater exploration techniques, methods of drilling of wells, percussion, rotary, reverse rotary, design of assembly and gravel pack, installation of well screen, completion and development of well, groundwater hydraulics determination of aquifer parameters by different method such as Theis, Jacob and Chow' s etc. Their recovery method, well interference, multiple well systems.

Unit III: Groundwater modelling:

Surface and subsurface exploitation and estimation of ground water potential, quality of ground water, artificial groundwater recharge planning, modeling, ground water project formulation.

Unit IV: Pumps and Classification:

Pumping Systems: Water lifting devices; different types of pumping machinery, classification of pumps, component parts of centrifugal pumps; pump selection, installation and troubleshooting

Unit V: Working of Pumps:

Design of centrifugal pumps, performance curves, effect of speed on head capacity, power capacity and efficiency curves, effect of change of impeller dimensions on performance characteristics; hydraulic ram, propeller pumps, mixed flow pumps and their performance characteristics; priming, self priming devices, rotodynamic pumps for special purposes such as deep well turbine pump and submersible pump.

AG307 Watershed Hydrology

Course Description & Objectives:

Study of hydrological cycles, precipitation, stream flow, hydrograph and modelling of watersheds, flood routing etc.

Course Outcomes:

The students will be able to:

1. *concentrate on hydrologic cycle, hydrograph and precipitation and its parameters.*
2. *apply empirical formulae and different methods for estimating the runoff and stream flow.*

Unit I: Hydrological Cycle:

Introduction; Hydrologic cycle; Precipitation forms, Weather systems for precipitation, Characteristics of precipitation in India; Rainfall measurement, rain gauge network, optimum number; Representation of rainfall data Mass curve, hyetograph, Moving average curve etc; Mean precipitation over an area Different methods.

Unit II: Precipitation:

Frequency analysis of point rainfall, Calculation of rainfall return period and probability, plotting position; Estimation of missing data, test for consistency of rainfall records; Double mass curve technique; Abstractions from precipitation interception; Depression storage; infiltration; evaporation; evapo transpiration estimation and measurement; Reservoir evaporation methods of reduction, Infiltration indices.

Unit III: Runoff:

Geomorphology of watersheds stream number, stream length, stream area, stream slope and Horton's laws; Runoff factors affecting, measurement; Runoff characteristics of streams, estimation of peak runoff rate and volume; Rational method, Cook' s method, SCS Curve number method.

Unit IV: Hydrograph:

Stream flow measurement of stage and velocity, rating curve, extension of rating curve; Hydrograph; components, Factors affecting the shape of hydrograph, base flow separation, unit hydrograph theory – Assumptions, applications, derivation of unit hydrographs, unit hydrograph of different durations, dimensionless unit hydrograph, distribution hydrograph, synthetic unit hydrograph, uses and limitations of unit hydrograph.

Unit V: Flood and Drought:

Floods Terms and definitions, Head water flood control methods, retards and their location; flood routing – graphical methods of reservoir flood routing; Channel routing Muskinghum method; Hydrology of dry land areas drought and its classification; introduction to watershed management and planning.

AG315 Machine Drawing

Course Description & Objectives:

Students will learn to apply principles of technical drawing and acquire skills in the use of appropriate computer aids for effective preparation of 3D models in Machine Drawing.

Course Outcomes:

Students will have fundamental knowledge of drawing of different machine parts such as sectional views, bolts, nuts and lock nuts.

Total 12 sheets to be drawn, minimum being 10

Sheet 1 : conversion of isometric views to orthometric views

Sheet 2 : conversion of optometric views to isometric views

Sheet 3	:	conventions of different materials and standard components
Sheet 4	:	sectional views
Sheet 5	:	fasteners, bolts and nuts, locknuts
Sheet 6	:	keys, couplings

Assembly drawing

Sheet 7	: stuffing box
Sheet 8	: eccentric
Sheet 9	: screw jack
Sheet 10	: connecting rod
Sheet 11	: swivel bearing
Sheet 12	: piston assembly

	0	0	3	3	2

AG319 Farm Machinery and Equipment Lab

Course Description & Objectives:

To study design features of various farm machinery and understanding them for effective use in different farming applications.

Course Outcomes:

Students will have knowledge of farm mechanization and use different machineries for agricultural operations.

List of Experiments:

1. Introduction to various farm machines
2. Field capacity and field efficiency measurement for at least two machines/ implements

3. Draft& fuel consumption measurement for different implements under different soil conditions
4. Construction details, adjustments and working of M.B. plow, disc plow and disc harrow and secondary tillage tools
5. Construction and working of rotavators and other rotary tillers, measurement of speed & working width
6. Working of seed cum fertilizer drills, planters and their calibration in field
7. Construction and Working of rice and crop transplanters for potato, sugarcane, cotton etc., and their field operation patterns
8. Weeding equipment and their use
9. Study of sprayers and dusters, measurement of nozzle discharge, field capacity etc.
10. Familiarization with various Farm machines related to harvesting, threshing, root harvesting, combine etc
11. Study of various types of mowers, constructional details, materials and working
12. Study of various types of reaper, constructional details, materials and working & performance
13. Study of various types of reaper binder, constructional details, materials and working
14. Study of various types of potato harvesters, constructional details, materials and working
15. Study of various types of groundnut harvesters, constructional details, materials and working & performance
16. Study of various types of forage harvester, constructional details, materials and working
17. Study of various types of sugarcane harvester, constructional details, materials and working

III Year I Semester

L	T	P	To	C
0	0	3	3	2

AG317 Database Management and Internet Lab

Course Description & Objectives:

Study the basics of internet usage and database management for proper collection, compilation and analysis of data in various applications.

Course Outcomes:

After completion of this lab students will have fundamental information of database management.

List of Experiments:

1. Creating a table, data base, inserting, manipulation
2. Programming using select statement
3. Programming using in and between operators
4. Programming using like operators
5. Programming using sub queries
6. Group by clause
7. Programming using aggregate function sum, min, max
8. Order by clause
9. Set operators
10. Internet applications
11. Tools required tags, attributes
12. Formatting text, heading, paragraph
13. Designing a web page background color, marquee, adding, images, and sound.

III Year II Semester

L	T	P	To	C
3	1	-	4	4

AG302 Irrigation Engineering

Course Description & Objectives:

To study the techniques of irrigation methods and understand the various technologies of irrigation.

Course Outcomes:

By completing this course, the student will be able to:

1. *acquire knowledge of irrigation water*
2. *use of irrigation water in farm lands*
3. *understand different irrigation methods*
4. *understand effective usage of water resources.*

Unit I: Introduction to Irrigation:

Irrigation Engineering: Irrigation, impact of irrigation on Human Environment, some major and medium irrigation schemes of India, purpose of irrigation, sources of irrigation water, present status of development and utilization of different water resources of the country.

Unit II: Measurement Techniques:

Measurement of irrigation water, weir, notches, flumes and orifices and other methods; waterconveyance, design of irrigation field channels, underground pipe conveyance system, irrigation structures, channel lining; land grading, different design methods and estimation ofearth work and cost;

Unit III: Soil, water and plant relationship:

Soil water plant relationship, soil water movement, infiltration, evapotranspiration, soil moisture constants, depth of irrigation, frequency of irrigation, irrigation efficiencies;

Unit IV: Irrigation Techniques:

Surface irrigation methods of water application, border, check basin, furrow and contour irrigation; sprinkler and drip irrigation method, merits, demerits, selection and design; Participatory irrigation management.

Unit V: Design of irrigation methods:

Economics of water resources utilization. Command area concepts and components, irrigation terminologies relevant to command area, on farm development works, farmer participation in water distribution, water delivery methods, design of unlined alluvial channels silt theories, design of lined channels, materials for lining.

TEXT BOOKS:

1. Michael, A.M. (1986). *Irrigation Theory and Practice.* Vikas Publishing House, New Delhi.
2. Israelson and Hassan. (1981). *Irrigation Principles and Practices.* John Wiley and sons, New York.

	3	1	-	4	4

AG304 Tractor Systems and Controls

Course Description & Objectives:

To study the basic prime mover of farming activities, its types, functions and capabilities in connecting various implements. Students would be exposed to different range of prime movers in this course.

Course Outcomes:

Students will have information about:

1. *tractor system and mechanism of different parts in the tractor.*
2. *types of brake, steering and hydraulic systems of tractor*
3. *tapping the power through different modes*
4. *application of ergonomics for better comfort and safety in tractor operation balancing techniques for tractor*

Unit I: Transmission System:

Study of transmission systems, clutches: functioning, parts and design problem on clutch system, Gear box: different types of gear box, calculation of speed ratios, design problems on gear box, Study on differential and final drive and planetary gears, Differential and final drive mechanism.

Unit II: Brakes, steering system and hydraulic system:

Familiarization of brake mechanism, Design problems. Steering geometry and adjustments Ackerman and hydraulic steering and hydraulic systems.

Unit III: Power Outlets

Tractor power outlets: P.T.O., belt pulley, drawbar, etc. Tractor chassis mechanics and design for tractor stability. Methods of finding CG of the tractor, Methods for finding moment of inertia of the tractor.

Unit IV: Ergonomics:

Ergonomic considerations and operational safety. Importance of anthropometric requirements in design. Power Tiller: Construction and working, Power transmission system

Unit V: Balancing:

Balancing of front and rear attached machinery. Importance of balancing, Techniques in balancing

TEXT BOOKS:

3	1	-	4	4

AG306 Dairy and Food Engineering

Course Descrption & Objectives:

Understanding the basics of dairy activities, process flow in milk and related production, packaging and distribution processes involved in dairy engineering is the basic objective of this course.

Course Outcomes:

At the end of this course the student would develop the following capabilities:

1. *abroad and coherent body of knowledge of milk source and composition*
2. *an in-depth understanding of thermal treatments during dairy products manufacture and the significance of healthy and functional foods*

Unit I: Milk and Milk Processing:

Dairy development in India. Engineering, thermal and chemical properties of milk and milk products, unit operations of various dairy and food processing systems

Unit II: Thermal Treatments:

Process flow charts for product manufacture, working principles of equipment for receiving, pasteurization, sterilization, homogenization, filling & packaging, butter manufacture

Unit III: Food Preservation:

Dairy plant design and layout, composition and proximate analysis of food products. Deterioration in products and their controls. Physical, chemical and biological methods of food preservation

Unit IV: Food Processing:

Changes undergone by the food components during processing, evaporation, drying, freezing and chilling

Unit V: Processing Techniques:

Behaviour of food products in extraction, leaching, crystallization, filtration, membrane separation, thermal processing. Plant utilities requirement.

TEXT BOOKS:

III Year II Semester	L	T	P	To	C
	3	1	-	4	4

AG308 Drainage Engineering

Course Description & Objectives:

To study the importance of drainage structures and the design of different drainage mechanisms

Course Outcomes:

Students will have basic fundamentals about

1. *drainage in agricultural lands*
2. *information on different drainage systems and structures.*
3. *calculation of subsurface flow by using different equations.*

Unit I: Introduction to Drainage:

Drainage definition; Need for land drainage; History of land drainage; Design considerations for land drainage; Definitions of parameters in drainage equations: hydraulic conductivity, tansmissivity, drainable porosity, drainage coefficient.

Unit II: Subsurface Flow:

Subsurface flow to drains Steady state equations; The Hooghoudt's equation derivation, importance of equivalent depth; The Ernst equation derivation, horizontal, vertical and radial flow; Unsteady state equations The Glover Dumm equation; Comparison between Steady State and Unsteady State;

Unit III: Surface Drainage System:

Surface drainage systems Bedding, Field drains, Field laterals; Layout of field drains and laterals; Diversion or interceptor drains; Subsurface drainage systems drain materials, envelopes, filters and surrounds; Functions of envelope, envelope materials, envelope requirements in relation to soil characteristics, gravel envelopes, organic envelopes, synthetic envelopes; Layout, construction and installation of drains

Unit IV: Drainage Structures:

Drainage structures; Tubewell drainage introduction, physical and economic feasibility; Mole drainage; Hydraulics of Drainage pipes Manning's equation for pipe flow hydraulic gradient and slope; Investigations of drain design parameters through drain testing hydraulic conductivity, transmissivity, drainable porosity

Unit V: Drainage Design:

Observation wells and their installation; Recording water table data and drain discharges; Flow equations used in drainage testing steady state and non steady state conditions; Drainage design criteria and system economics.

AG316 Irrigation and Drainage Engineering Lab

Course Description & Objectives:

The practical in relation to course like irrigation engineering and drainage engineering would be performed by the student in this laboratory.

Course Outcomes:

Students will have practical knowledge about irrigation techniques and their designs. They will have the knowledge of drainage techniques and their field uses.

List of Experiments:

1. Measurement of soil moisture by different soil moisture measuring instruments
2. Determination of soil moisture constants by pressure plate and pressure membrane apparatus
3. Measurement of irrigation water and infiltration rate
4. Computation of evapotranspiration
5. Determination of crop water requirement
6. Irrigation scheduling
7. Land grading exercises
8. Design of underground pipe line system
9. Design of drip and sprinkler irrigation
10. Measurement of uniformity coefficient of sprinkler irrigation method
11. Measurement of uniformity coefficient of drip irrigation method
12. Field problems and remedial measures for sprinkler and drip irrigation method
13. *In situ* measurement of hydraulic conductivity Auger hole method
14. Determination of drainage coefficients
15. Preparation of water contour maps
16. Measurement of hydraulic conductivity through drain testing
17. Measurement of drainable porosity through drain testing
18. Design of surface drainage systems
19. Design of subsurface drainage systems
20. Installation techniques of sub surface drainage system
21. Cost analysis of surface and sub surface drainage system

AG318 Field Operation and Maintenance of Tractors and Farm Lab

Course Description & objectives:

The methods of operation of various farming implements with tractor would be undertaken by the students in real time field o have the basic idea of mechanized farming.

Course Outcomes:

Students will have real field experience to broaden their idea about farm machinery and use of tractor for different farming operation.

List of Experiments:

1. Introduction to various systems of a tractor viz. fuel, lubrication, cooling, electrical, transmission, hydraulic and final drive system
2. Familiarization with tractor controls and learning procedure of tractor starting and stopping
3. Hitching, adjustments, settings and field operation of farm machinery
4. Familiarization with different makes and models of 4 wheeled tractors
5. Starting and stopping practice of the tractor and familiarization with instrumentation panel and controls
6. Road signs, traffic rules, road safety, driving & parking of tractor
7. Tractor driving forward & reverse driving practice
8. Tractor driving practice with two wheeled tractor trailer forward & reverse
9. Study and practicing the hitching and de hitching of implements
10. Study operation and field adjustments of M.B. plough & disk plough
11. Field operation of trailing & mounted disk harrow
12. Field operation and adjustments of seed drill/planter/sprayer
13. Familiarization with tools and equipment used for maintaining and servicing of tractors and farm machines
14. Maintenance after 10, 50, 100, 250, 500 and 1000 hours of operation, adjustment of tractor track
15. Dismantling and assembling of major engine parts

16. Visit to tractor/ engine repair workshop, injection pump injector repair shop
17. Doing minor repair of electric, mechanical and hydraulic system
18. Adjustment and maintenance of seeding and planting and transplanting machines
19. Adjustment and maintenance of reapers and threshers
20. Adjustment and maintenance of combine harvesters, straw combines, balers etc
21. Visit to small scale farm machinery manufacturers and their repair shops, seasonal repair of farm machinery

AG320 Mini Project

Course Description & Objectives:

Objective of the mini project is to enable student analytical and practical exposure by giving hands on experience with learned knowledge through different courses. It prepares the student to efficiently handle the main project for better output.

Course Outcomes:

By undergoing this course, the student will try to integrate and apply the knowledge gained through different courses into practical problems and to analyse the system for its productivity and feasibility.

AG401 Soil and Water Conservation and Structures

Course Description & Objectives:

To study the concepts of conservation techniques of soil and water, to design the structures required for the same under varying conditions.

Course Outcomes:

Students will have fundamental knowledge:

1. *on soil erosion with its control as well as sedimentation.*
2. *on soil and water conservation structures and their management.*
3. *on designing of suitable structures for effective erosion control*

Unit I: Soil Erosion:

Soil erosion causes, types and agents of soil erosion; water erosion forms of water erosion, mechanics of erosion; Effect of slope, slope length, soil, vegetation, topographical features and rainfall on erosion, gullies and their classification, stages of gully development; soil loss estimation universal soil loss equation and modified soil loss equation, determination of their various parameters.

Unit II: Erosion Control Measures:

Erosion control measures agronomic measures contour cropping, strip cropping, mulching; mechanical measures terraces – level and graded broad base terraces and their design, bench terraces and their design, layout procedure, terrace planning, bunds contour bunds, graded bunds and their design; gully and ravine reclamation principles of gully control vegetative and temporary structures; control measures for stream bank and coastal erosion.

Unit III: Sedimentation and Wind Erosion:

Landslides factors causing it, land slips, Measures for control; Sedimentation sedimentation in reservoirs and streams; Estimation and measurement, sediment delivery ratio, trap efficiency; Land use capability classification; Grassed waterways and their design; Introduction to water harvesting techniques; introduction to stream water quality and pollution. Wind erosion factors affecting wind erosion, mechanics of wind erosion, soil loss estimation, wind erosion control measures vegetative, mechanical measures, wind breaks and shelterbelts, sand dunes stabilization.

Unit IV: Conservation Structures:

Classification of conservation structures, functional requirements of soil erosion control structures; flow in open channels types of flow, state of flow, regimes of flow, energy and momentum principles, specific energy and specific force, flow transitions due to hump and width variations; hydraulic jump and its application, type of hydraulic jump, energy dissipation due to jump, jump efficiency, relative loss of energy; straight drop spillway general description, functional use, advantages and disadvantages, structural parts and functions; components of spillway, hydrologic and hydraulic design, free board and wave free board, aeration of weirs, concept of free and submerged flow.

Unit V: Structure Design:

Structural design of a drop spillway loads on headwall, variables affecting equivalent fluid pressure, determination of saturation line for different flow conditions, seepage under the structure, equivalent fluid pressure, triangular load diagram for various flow conditions, creep line theory, uplift pressure estimation, safety against sliding, overturning, crushing and tension; chute spillway general description and its components, hydraulic design, energy dissipaters, design criteria of a SAF stilling basin and its limitations, drop inlet spillway general description, functional use, design criteria; design of diversions; small earth embankments their types and design principles, farm ponds, percolation ponds, check dams and reservoirs. Environmental impact assessment.

AG403 Electrical Machines and Power Utilization

Course Description & Objectives:

To study different electrical power machines and their use in various applications in agricultural operations.

Course Outcomes:

Students will be able to acquire knowledge about:

1. *Different types of circuits and their applications.*
2. *Principles and operation of transformers, DC machines and motors.*
3. *Various methods of power measurement*

Unit I: Introduction

Electro motive force, reluctance, laws of magnetic circuits, determination of ampere turns for series and parallel magnetic circuits, hysteresis and eddy current losses,

Unit II: Transformer

Transformer: principle of working, construction of single phase transformer, EMF equation, phasor diagram on load, leakage reactance, transformer on load, equivalent circuit, voltage regulation, power and energy efficiency, open circuit and short circuit tests,

Unit III: DC Machine

Principles, operation and performance of DC machine (generator and motor), EMF and torque equations, armature reaction, commutation, excitation of DC generator and their characteristics, DC motor characteristics

Unit IV: Motors

Starting of shunt and series motor, starters, speed control methods field and armature control, polyphase induction motor: construction, operation, equivalent circuit, phasor diagram, effect of rotor resistance, torque equation, starting and speed control methods,

Unit V: Single Phase Induction Motor

Single phase induction motor: double field revolving theory, equivalent circuit, characteristics, phase split, shaded pole motors, disadvantage of low power factor and power factor improvement, various methods of single and three phase power measurement.

ME425 Refrigeration and Air Conditioning

Course Description & Objectives:

To introduce history, importance and components of mechanical engineering, concepts of unit operations and unit processes, and current scenario of refrigerants & industrial applications.

Course Outcomes:

Upon successful completion of this course, the student will be able to:

1. *understand the difference between refrigeration and air conditioning*
2. *describe the two methods of lowering the temperature of material*
3. *identify and describe the three methods of heat transfer*
4. *understand the kinds of refrigeration systems available*
5. *understand kinds of air refrigeration systems available*
6. *understand types of vapor refrigeration systems available*
7. *understand reasons of phase change of matter*

Unit I : Introduction to Air Refrigeration and Refrigerants

Refrigeration - Unit of refrigeration, Reversed Carnot Cycle, Bell-Coleman refrigeration system. Actual air refrigeration system - Refrigeration needs of Aircrafts - Adoption of Air refrigeration, Justification. Types of air refrigeration systems - Problems. Desirable and undesirable properties - Common refrigerants used – Nomenclature, Environmental effects of refrigerants.

Unit II: Vapour Compression Refrigeration System

Compression System. Wet Compression, Dry Compression, Superheated Compression Representation of cycle on T-S, P-H and H-S charts – effect of sub cooling and super heating - cycle analysis - Actual Cycle, Influence of various parameters on system performance - use of P-H charts – Problems. Compressors - General classification – comparison. Condensers - Classification - Working. Evaporators - Classification - Working. Expansion Devices - Types -Working.

Unit III: Vapour Absorption Refrigeration System

Basic vapour absorption system. Ammonia absorptionsystem,Li - Br system, Electrolux refrigeration system, Calculation of COP. Miscellaneous refrigeration systems: Steam Jet Refrigeration System, Thermoelectric Generator and Vortex tube or Hilsch tube – working principles

Unit IV: Psychometric

Psychrometric Properties and Processes, Need for Ventilation, Infiltration, Concepts of RSHF, GSHF, ESHF and ADP. Concept of human comfort and effective temperature, Comfort Air-conditioning – Applications – Summer, Winter & Year round Air Conditioning Systems &Load Calculations, Industrial Air conditioning and Requirements.

Unit V: Equipment of Air-Conditioning Systems

Air cleaning and filters, Humidifiers and dehumidifiers, Fans and Blowers, Grills and Registers. Heat pumps - different circuits.

MS 310 Managerial Economics

Course Description & Objectives:

The course aims to develop student’s capacity to analyze the economic environment in which business entities operate and understand how managerial decisions can vary under different constraints that each economic environment places on a manager’s pursuit of it’s goals, focusing on analyzing the functioning of markets and the economic behavior of firms and other economic agents.

Course Outcomes:

By the end of this course it is expected that the student will be able to:

1. *Understand nature and scope of managerial economics and its application in managerial decision making*
2. *Demand determinants, elasticity of demand and demand forecasting methods for marketing planning.*
3. *Theory of production, law of variable proportions and returns to scale*
4. *Cost analysis and cost output relationship*
5. *Types of markets and price determination*

UNIT I: Nature & Scope of Managerial Economics:

Basic tools and techniques of Business Economics, Macro Economic Environment and Managerial decisions.

UNIT – II: Demand Analysis:

Types of Demand, Demand determination Concept of Elasticity and measurement, Demand forecasting, Survey & Statistical methods.

UNIT – III: Theory of Production:

Production function, Marginal rate of technical substitution, Iso-quants and Iso-costs, production function with one/two variable factors,Law of Variable Proportions, and Returns to Scale, internal and external economies.

UNIT – IV: Cost Analysis:

Cost concepts, cost determinants, cost output relationship in the short and long run, Break-Even analysis.

UNIT-V: Markets and price determination:

Features and types of different competitive situations – Perfect competition, Monopoly, Monopolistic competition and Oligopoly, pricing methods in practice.

AG421 Soil and Water Conservation and Structures Lab

Course Description & Objectives:

To study the various conservation structures to be employed in adverse conditions for management of soil and water.

Course Outcomes:

Students will have practical knowledge of soil and water conservation structures with their design considerations.

List of Experiments:

1. Study of soil loss measurement techniques
2. Study of details of Coshocton wheel
3. Study of details of multi slot runoff samplers
4. Study of rainfall simulators and runoff plots
5. Determination of sediment concentration by oven drying method
6. Preparation of contour map of an area and its analysis
7. Design of vegetated waterways and contour bunding system
8. Design of graded bunding system
9. Design of various types of bench terracing systems
10. Determination of rate of sedimentation and storage loss in reservoir
11. Design of Shelter belts and wind breaks.
12. Construction of specific energy and specific force diagram
13. Design of H flume and Parshall flume
14. Measurement of hydraulic jump parameters and amount of energy dissipation
15. Hydraulic design of a straight drop spillway
16. Determination of uplift force and construction of uplift pressure diagram
17. Determination of loads on headwall and construction of triangular load diagram
18. Hydraulic design of a chute spillway
19. Design of a SAF energy dissipater
20. Design of small earth embankments
21. Design of water harvesting structures
22. EIA analysis and cost estimation of structures.

AG419 Refrigeration and Air Conditioning

Course Description & Objectives:

This subject explores the basics of psychrometry and various types of refrigeration and air-conditions system which will be applicable for both domestic and industry.

Course Outcomes:

Students will have practical knowledge of refrigeration system to broaden its industrial applications and uses.

List of Experiments:

1. Study of vapour compression and vapour absorption systems
2. Study of eletrolux refrigerator
3. Solving problems on refrigeration on vapour absorption system
4. Experiments with the refrigeration tutor to study various components of refrigeration
5. Determination of the coefficient of performance of the refrigeration tutor
6. Experiment on humidifier for the determination of humidifying efficiency
7. Experiment on dehumidifier for the determination of dehumidifying efficiency
8. Experiment on the cooling efficiency of a domestic refrigerator
9. Experiments on working details of a cold storage plant and air conditioning unit
10. Experiments with air conditioning tutor to study various components
11. Determination of the coefficient of performance of air condititiong tutor
12. Estimation of refrigeration load; Estimation of cooling load for air conditioner
13. Estimation of humidification and dehumidification load
14. Design of complete cold storage system.

AG423 Dairy and Food Engineering Lab

Course Description & Objectives:

The practical in relation dairy and food engineering would be performed by the student in this laboratory.

Course Outcomes:

Students will get information about different processing machineries and their uses on industrial scale.

List of Experiments:

1. Study of a composite pilot milk processing plant & equipments
2. Study of pasteurizers
3. Study of sterilizers
4. Study of homogenizers
5. Study of separators
6. Study of butter churners
7. Study of evaporators
8. Study of milk dryers
9. Study of freezers
10. Design of food processing plants & preparation of layout
11. Visit to multiproduct dairy plant
12. Determination of physical properties of food products
13. Estimation of steam requirements
14. Estimation of refrigeration requirements in dairy & food plant
15. Visit to Food industry

AG309 Food Packaging Technology

Course Description & Objectives:

To acquaint and equip the students with packaging methods, packaging materials, packaging machineries, modern packaging techniques etc.

Course Outcomes:

Students will have the information of:

1. importance of storage of food materials.
2. methods of packaging of perishable products.
3. types of packaging and their effect of quality maintenance.
4. economics of packaging of food materials

Unit 1: Introduction of Storage:

Factors affecting shelf life of food material during storage; spoilage mechanism during storage; definition, requirement, importance and scope of packaging of foods.

Unit II: Introduction of Packaging:

Types and classification of packaging system; advantage of modern packaging system. Different types of packaging materials used.

Unit III: Types of Package:

Different forms of packaging, metal container, glass container, plastic container, flexible films, shrink packaging, vacuum & gas packaging

Unit IV: **Selection of Packaging Material:**

Packaging requirement & their selection for the raw & processed foods. Advantages & disadvantages of these packaging materials; effect of these materials on packed commodities, Package testing, Printing, labelling and lamination.

Unit V: Economics of Packaging:

Economics of packaging; performance evaluation of different methods of packaging food products; their merits and demerits; scope for improvements; disposal and recycle of packaging waste.

AG310 Development of Processed Products and Equipments

Course Description & Objectives:

To acquaint and equip the students with the processed products and their equipments. This provides the knowledge to the student about different process involved during processing of agriculture products lice rice, oil seeds etc.

Course Outcomes:

After completion of the course, students will have:

1. *the understanding of the processed products and equipments,*
2. *knowledge on techniques used during processing.*
3. *knowhow of product development technology*
4. *ability to decide the various handling and process equipment*
5. *basic knowledge for various food industry jobs.*

Unit 1: Introduction of Food Processing:

Applications of unit operations to the food industry, analytical processing concepts with regards to mass and energy balances, equipment involved in the commercially important food processing methods and unit operations; value addition to cereals like rice, wheat etc.

Unit 1: Introduction of Food Processing:

Applications of unit operations to the food industry, analytical processing concepts with regards to mass and energy balances, equipment involved in the commercially important food processing methods and unit operations; value addition to cereals like rice, wheat etc.

Unit II : Processing of Food Products:

Parboiling of rice, quality of processed products of rice & wheat. Processing of pulses, extruded food product, fermented food product, frozen and dried product, technology of meat, fish and poultry products, technology of milk and milk products.

Unit III: Product Development Technology:

Technology of oilseeds and fat products, snack foods, Fruits and vegetable products: candy, nutraceuticals, food product development trends, food additives and labeling.

Unit IV: **Processing Equipment:**

Process equipment for thermal processing evaporation, dehydration, drying, blanching, pasteurization, distillation; mechanical separation filtration, sieving, centrifugation, sedimentation;

Unit V: Handling and Primary Process Equipment:

Mechanical handling conveying and elevation; size reduction and classification mixing; kneading, blending and emulsification.

AG405 Food Processing Plant Design and Layout

Course Description & Objectives:

To expose the students with the design features of different food processing equipments being used in the industries and with the layout, planning of different food and processing plants.

Course Outcomes:

The students will gain knowledge about:

1. *types of plan design and their constraints.*
2. *precautions and design criteria for processing plants of cereals, pulses*
3. *precautions and design criteria for processing plants of horticultural and vegetable crops*
4. *design requirements for processing plants pf milk and meat products*
5. *installation requirements of processing plants.*

Unit 1: Introduction to Plan Design:

Meaning and definition of plant layout. Objectives and principles of layout. Types of layouts.

Unit II: Salient features of processing plants:

Salient features of processing plants for cereals, pulses, oilseeds, horticultural and vegetable crops, poultry, fish and meat products, milk and milk products.

Unit III: Plant Layout:

Location selection criteria, selection of processes, plan capacity, project design, flow diagrams, selection of equipment, process and controls, handling equipment.

Unit IV: Plant Layout: Secondary Consideration:

Plant layout, plant elevation, requirement of plant building and its components, labour requirement.

Unit V: Plant Installation:

Plant installation, power and power transmission, sanitation, cost analysis, preparation of feasibility report.

AG411 Agricultural Structures and Environment Control

Course Descripition & Objectives:

To expose the students with design of agriculture structures with standard according BIS.

Course Outcomes:

The student will gain the knowledge of:

1. *design of agriculture structures*
2. *the techniques to control temperature, humidity and other composition of air to create favorable environment in the agricultural structures.*

Unit I: **Introduction to agricultural structure and environmental Control:**

Planning and layout of farmstead. Physiological reactions of livestock to solar radiation and other environmental factors, livestock production facilities,

Unit II: Introduction to BIS standard for farm structure:

BIS. Standards for dairy, piggery, poultry and other farm structures. Design, construction and cost estimation of farm structures; animal shelters, compost pit, fodder silo, fencing and implement sheds, barn for cows, buffalo, poultry, etc.

Unit III: Rural development:

Engineering for rural living and development, rural roads, farm fencing, their construction cost and repair and maintenance

Unit IV: **Introduction to solid waste management:**

Design of septic tank for small family. Solid waste management system

Unit V: BOD and COD:

BOD and COD of food plant waste, primary and secondary treatment of food plant waste.

TEXT BOOKS:

AG406 Design and Maintenance of Greenhouse

Course Description & Objectives:

To expose the student to the fundamental knowledge of greenhouse and their design and maintenance.

Course Outcomes:

The student will gain the knowledge of:

1. *importance of greenhouse with respect to different climate and crop.*
2. *design of greenhouse according the climate and requirements of the crop.*
3. *climate control inside greenhouse.*
4. *economics of greenhouse and selection criteria for efficient management*

Unit 1: Introduction to Greenhouse :

History and types of greenhouses; importance, function and features of green house; scope and development of green house technology.

Unit II: Design of Greenhouse:

Location, Planning and v arious component of greenhouse; design criteria and calculation; constructional material and methods of construction; covering materials and its characteristics,

Unit III: Heating and Cooling System of Greenhouse:

Solar heat transfer, solar fraction for green house, steady state analysis of green house, Greenhouse heating, cooling, shedding and ventilation systems;

Unit IV: Environment inside Greenhouse:

Carbon Dioxide generation and monitoring and lighting systems, instrumentation & computerized environmental Control Systems. Watering, fertilization, root substrata and its pasteurization, containers and benches, plant nutrition.

Unit V: Economy and application of Greenhouse:

Alternative cropping systems; plant tissue culture, chemical growth regulation; disease control; integrated pest management;
Postproduction quality and handling Cost analysis of greenhouse production; Applications of green house & its repair & maintenance.

AG415 Micro Irrigation System Design

Course Description & Objectives:

To expose the student to the fundamental knowledge in micro irrigation systems used in irrigation of crops with the design concepts of micro-irrigation systems likes drip irrigation, Sprinkler irrigation with fertilization application.

Course Outcomes:

On completion of course the student will:

1. *get the knowledge on micro irrigation concepts.*
2. *be able to understand the design concepts related to sprinkler irrigation and drip irrigation.*
3. *be able to suitably select and adopt different irrigation systems according to water requirement.*

Unit 1: Introduction to Micro Irrigation:

Past, present and future need of micro irrigation systems, Role of Govt. for the promotion of micro irrigation in India, Merits and demerits of micro irrigation system,

Unit II: Types and Design of Micro Irrigation:

Types and components of micro irrigation system, Micro irrigation system design, installation, and maintenance. Sprinkler irrigation types, planning factors, uniformity and efficiency, laying pipeline, hydraulic lateral, sub mains and main line design, pump and power unit selection.

Unit III: Drip Irrigation:

Drip irrigation – potential, automation, crops suitability. Fertigation – Fertilizer application criteria, suitability of fertilizer compounds, fertilizer mixing, injection duration, rate and frequency, capacity of fertilizer tank.

Unit IV: Micro Irrigation and Poly House:

Quality control in micro irrigation components, design and maintenance of polyhouse, importance and application of polyhouse

Unit V: Development of Waste Land:

Prospects of waste land development –hills, semi arid, coastal areas, water scarce areas, Benefit and Cost analysis.

TEXT BOOKS:

AG314 Watershed Planning and Management

Course Description & Objectives:

To acquaint and equip the students with the watershed planning and management knowledge related soil and water resources within the watersheds. The expose the student with the different techniques of analysis of different watersheds characteristics and hydrological data

Course Outcomes:

At the completion of the course the student should be able to:

1. *apply appropriate management techniques for watershed planning*
2. *know operating and maintaining techniques of the different components of integrated soil and water resources in the watershed.*
3. *know watershed modeling procedures.*

Unit 1: Introduction to Watershed Management:

Watershed management problems and prospects; Principles, Objectives, benefits and components of watershed management, Identification of watershed problems

Unit II: Watershed Planning:

watershed based land use planning, watershed characteristics – physical and geomorphologic, factors affecting watershed management, hydrologic data for watershed planning, watershed delineation, delineation of priority watershed

Unit III: Watershed Structure and Water yield Measurement:

Water yield assessment and measurement from a watershed; hydrologic and hydraulic design of earthen embankments and diversion structures; sediment yield estimation and measurement from a watershed, sediment yield models; rainwater conservation technologies in situ and storage

Unit IV: Design and Use of Watershed:

Design of water harvesting tanks and ponds; water budgeting in a watershed; effect of cropping system, land management and cultural practices on watershed hydrology

Unit V: Watershed modelling and Preparation of Project Proposal:

Evaluation and monitoring of watershed programmes; people's participation in watershed management programmes; planning and formulation of project proposal; cost benefits analysis of watershed programmes; watershed modeling optimal land use models; case studies.

AG409 Minor Irrigation and Command area Development

Course Description & Objectives:

To expose the student with the fundamental knowledge of minor irrigation, its types operation, maintenance and people participation. It will also expose the student about the command area development, on farm structures, policy operation and maintenance

Course Outcomes:

At the completion of the course the student will:

1. *have the knowledge and skills on Planning, design, operation and management of reservoir system.*
2. *gain knowledge on different methods of irrigation including canal irrigation.*
3. *be exposed to techniques of remote sensing*
4. *be able to make participation of farmers in command area development activities.*

Unit 1 Introduction to Irrigation Projects:

Major, medium and minor irrigation projects – their comparative performance; development and utilization of water resources through different minor irrigation schemes.

Unit II: Introduction to Command area:

Basic concepts of command area – definition, need, scope, and development approaches: historical perspective, command area development authorities;

Unit III Farm Development Activities:

Interaction/collaboration of irrigation water use efficiency and agricultural production. Planning and execution of on farm development activities within the scope of command area development;

Unit IV Remote Sensing Techniques:

Use of remote sensing techniques for command area development; case studies of some selected commands

Unit V Farmer's Participation:

Farmer's participation in command area development. Case studies in related areas.

TEXT BOOKS:

AG410 Gully and Ravine Control Structures

Course Description & Objectives:

To expose the student with the fundamental knowledge of flood and their impact on the natural resources. To provide the basic knowledge to analyse the flood data with different hydrological and meteorology data.

Course Outcomes:

At the completion of the course the student will:

1. *have knowledge of flood and flood related problem specially soil erosion and damage of crop*
2. *have the techniques in estimating the flood during peak seasons.*
3. *know how to perform the flood routing.*
4. *have the knowledge in proper design of flood storage structure to prevented soil erosion.*
5. *know planning for flood control methods and their economics.*

Unit 1: Introduction to Flood:

Introduction; floods - causes of occurrence, flood classification - probable maximum flood, standard project flood.

Unit II: Flood Estimation Methods:

Design flood, flood estimation - methods of estimation; estimation of flood peak - Rational method, empirical methods, Unit hydrograph method;

Unit III: Statistics in Hydrology:

Statistics in hydrology, flood frequency methods - Log normal, Gumbel's extreme value, Log-Pearson type-III distribution; depth-area-duration analysis;

Unit IV: Flood Routing Methods:

flood forecasting, flood routing – channel routing, Muskingum method, reservoir routing, modified Pul' s method; flood control - history of flood control, structural and non-structural methods of flood control measures,

Unit V Flood Management:

storage and detention reservoirs, levees, channel improvement; Gulley erosion and its control; soil erosion and sediment control measures; river training works, planning of flood control projects and their economics.

AG313 Remote Sensing & GIS Applications

Course Description & Objectives:

To introduce the students with principles and basic concepts of Remote Sensing and GIS and its applications in data analysis and planning.

Course Outcomes:

At the end of the course, the students will understand:

1. *the remote sensing principles, satellite data processing and available data products.*
2. *the spatial data models, analysis and presentation techniques*
3. *application of Remote Sensing and GIS techniques in various fields of agriculture, soil, land and forest resources*
4. *decision making process and utilization of advanced techniques in addressing the real world problems.*

Unit 1: Introduction Remote Sensing:

Introduction, History of remote sensing, Physics of Radiant Energy – Electromagnetic spectrum and its nature, Interactions of electromagnetic radiation with different media, Atmospheric effects in remote sensing, Spectral Reflectance curves of vegetation, soil and water, Ideal and real remote sensing. Atmospheric windows, Active and Passive remote sensing;

Remote Sensing Platforms and Sensors: Introduction, Earth Resources Satellites – IRS series, Landsat Series and SPOT, Meteorological and Other satellites, Sensor Parameters and Sensor Systems used in Imaging; Resolution: Spatial, Spectral, Radiometric and Temporal.

Unit II: Image Analysis:

Aerial Remote Sensing: Introduction to Photogrammetry, Geometry of vertical photograph, Stereo viewing, Stereoscopic depth perception, Use of stereoscopes, Mosaicing; Microwave Remote Sensing: Introduction, radar principle, radar image properties, distortions, applications. Radar Polarimetry. SAR Images. Radiometry for crop monitoring and hydrologic forecasting; Data Products, Visual and Digital Image Processing; Image analysis: Visual interpretation, digital processing, pre-processing, enhancement, transformation, classification, Integration; Image interpretation: Basic principles, factors governing quality of an image, factors governing interpretability, visibility of objects, techniques of interpretation, digital image processing;

Unit III: Application of Remote Sensing and Introduction to GIS:

Satellite data Products, their different types, Visual Image Interpretation and its key elements, Introduction and Basic character of digital image, Image Pre-processing and Image registration; Applications of RS: RS in Agricultural Engineering, agriculture, hydrology, land cover, mapping etc; Image interpretation for water resources development and soil conservation survey. Fundamentals of GIS, Introduction to GIS, Roots of GIS, Overview of Information System, GIS definitions and terminology,

Unit IV: Introduction to GIS Tools:

GIS architecture, Framework of GIS, Spatial data modelling, Vector GIS models and Raster GIS models, GIS data management. Database management system: Data file management, database models, storage of GIS data, object based data models, Topology, DBMS in GIS. Data input and editing: data stream, data input methods, GPS for data capture, data editing. Data quality issues: Introduction, accuracy, precision and resolution, consistency, completeness, sources of error in GIS, modeling errors, error evaluation by GIS.

Unit V: RS and GIS Application:

Data analysis and modeling: Introduction, format conversion, data medium conversion, spatial measurement methods, reclassification, buffering techniques, overlay analysis, modeling surfaces: DTM, TIN, slope model, GIS outputs. Integration of RS and GIS: RS and GIS synergy need for integration, facilities for integration, RS & GIS applications in Agrl. Engineering.

Entering data in computer, digitizer – scanner data compression.

AG417 Systems Engineering

Course Description & Objectives:

The student will expose different techniques of systems engineering of mathematic which are used in water resources engineering, food engineering and farm machinery.

Course Outcomes:

The course will enable the students to:

1. *focus on defining customer needs and required functionality early in the development cycle*
2. *proceed with design synthesis and system validation while considering the complete problem including operations, performance, test, manufacturing, cost, and schedule.*
3. *link systems enginee*ring to fundamentals of decision theory, statistics, and optimization.
4. introduce the most current, commercially successful techniques for systems engineering

Unit 1: System concepts:

System concepts. Requirements for a Linear programming problems. Mathematical Formulation of Linear Programming problems and its Graphical solution.

Unit II: Response of Systems:

Response of Systems. Computer as a tool in system analysis. Simplex method. Degeneracy and Duality in Linear programming. Artificial variable techniques, Big M method and two phase methods.

Unit III: Mathematical models:

Mathematical models of physical systems. Modelling of Agricultural Systems and operations. Cost analysis.

Unit IV: Methodologies of management:

Transportation problems. Assignment problems. Waiting line problems;

Unit V: Project Management:

Project management by PERT/CPM. Resource scheduling.

AG414 Reservoir and Farm Pond Design

Course Description & Objectives:

To introduce the students with reservoir and farm pond design systems for agriculture watershed.

Course Outcomes:

At the completion of the course the student will:

1. *have knowledge and skills on planning, design, operation and management of reservoir system*
2. *have knowledge on planning, and management of and farm pond systems.*
3. *be exposed to different techniques to analysis different hydrological and metrology data*
4. *understand requirements of seepage line, drainage filters and pipings.*
5. *have knowledge on failure of earthern embankments and its prevention.*

Unit 1: Introduction to Earthen Embankments:

Earthen embankments functions, advantages and disadvantages, classification – hydraulic fill and rolled fill dams homogeneous, zoned and diaphragm type;

Unit II: Seepage Estimation:

Foundation requirements, grouting, seepage through dams estimation of seepage discharge, location of seepage/phreatic line by graphical and analytical methods, flow net and its properties

Unit III: Seepage Characteristics:

Seepage pressure, seepage line in composite earth embankments, drainage filters, piping and its causes

Unit IV: Design and Construction of Earthen Embankments:

Design and construction of earthen dam, stability of earthen embankments against failure by tension, overturning, sliding etc; stability of slopes analysis of failure by slice method

Unit V: Reservoirs and Farm Ponds:

Types of reservoirs and farm ponds, design and estimation of earth work; cost analysis.

AG312 Tractor Design and Testing

Course Description & Objectives:

To acquaint and equip with the latest design procedures of tractor and its systems with testing procedure.

Course Outcomes:

At the completion of the course the student will:

1. *have knowledge and skills on power transmission system of a tractor*
2. *know the design procedures of hydraulic systems and steering system.*
3. *understand design features and selection of engine for tractor.*

   know the testing procedures for tractor

Unit 1: Design and Development of Tractor:

Procedure for design and development of agricultural tractor, Study of parameters for balanced design of tractor for stability & weight distribution

Unit II: Power Transmission:

Hydraulic lift and hitch system design. Design of mechanical power transmission in agricultural tractors.

Unit III: Design of Hydraulic and Steering:

Design of Ackerman Steering and tractor hydraulic systems. Essential features of steering and hydraulic systems, problems associated in hydraulic systems.

Unit IV: Tractor Engines Design:

Study of special design features of tractor engines and their selection.

Unit V: Tractor Testing:

Design of seat and controls of an agricultural tractor. Tractor Testing.

AG407 Hydraulic Drive & Controls

Course Description & Objectives:

To expose the student to the fluids properties, hydraulic, pumps, valve and services used in agricultural machinery

Course Outcomes:

At the completion of the course the student will have:

1. *knowledge and skills on, hydraulic, pumps used in machinery.*
2. *knowledge on different kinds of valves.*
3. *skills on trouble shooting in valves.*
4. *knowledge on safety features and service requirements of various hydraulic and pneumatic circuits.*

Unit 1: Introduction to Hydraulic:

Hydraulic Basics: Pascal's Law, Flow, Energy, Work, and Power. Hydraulic Systems, Colour Coding, Reservoirs, Strainers and Filters, Filtering Material and Elements.

Unit II: Introduction to Pumps and Gauges:

Accumulators, Pressure Gauges and Volume Meters, Hydraulic Circuit, Fittings and Connectors. Pumps, Pump Classifications, Performance, Displacement, Designs, Gear Pumps, Vane Pumps, Piston Pumps, Pump Operation.

Unit III: Introduction to Valve:

Hydraulic Actuators, Cylinders, Construction and Applications, Maintenance, Hydraulic Motors. Valves, Pressure Control Valves, Directional Control Valves, Flow Control Valves, Valve Installation, Valve Failures and Remedies,

Unit IV: Troubleshooting of Valve:

Valve Assembly, Troubleshooting Valves Hydraulic Circuit Diagrams and Troubleshooting, United States of American Standards Institute USASI Graphical Symbols Tractor hydraulics, nudging system, ADDC.

Unit V: Safety and Services:

Pneumatics: Air services, logic units, Fail safe and safety systems Robotics: Use of Hydraulics and Pneumatics drives in agricultural systems, PLCs(Programmable Logic Controls).

AG311 Farm Power and Machinery Management

Course Description & Objectives:

To expose the student with the mechanization status in the country and management techniques for future requirements.

Course Outcomes:

At the completion of the course the student will:

1. *have knowledge about the present status of farm mechanization*
2. *be able to optimally select machinery for varying uses.*
3. *be able to plan for mechanization of the farm.*
4. *able to estimate the cost of machinery.*

Unit 1: Mechanization:

The role of mechanization and its relationship to productivity, employment, social and Technological change.

Unit II: Cost Analysis:

Performance and power analysis; cost analysis of machinery: fixed cost and variable costs, effect of inflation on cost;

Unit III: Machinery Selection:

Selection of optimum machinery and Replacement criteria; Break even analysis, reliability and cash flow problems;

Unit IV: Mechanization in India:

Mechanization Planning; case studies of agricultural mechanization in India.

Unit V: Human Safety:

Human Engineering aspects and gender studies.

AG416 Human Engineering and Safety

Course Description & Objectives:

To impart the fundamental knowledge to the student on the importance of human engineering and safety in the field of agriculture machinery.

Course Outcomes:

At the completion of the course the student will:

1. *understand the importance of human factors and their application in system development.*
2. *know the effect of visual, auditory and factual displays in human performance.*
3. *understand the importance of optimum work-rest cycles in endurance.*
4. *be able to ideally design the work space in accordance to anthropometry.*
5. *have the general understanding safety features and regulation acts in farm machinery.*

Unit 1: Human Factor:

Human factors in system development – concept of systems; basic processes in system development, performance reliability,

Unit II: Human Performance:

Human performance. Information input process, visual displays, major types and use of displays, auditory and factual displays. Speech communications.

Unit III: Human Controls:

Biomechanics of motion, types of movements, Range of movements, Strength and endurance, speed and accuracy, human control of systems. Human motor activities, controls, tools and related devices.

Unit IV: Introduction to Anthropometry:

Anthropometry: arrangement and utilization of work space, atmospheric conditions, heat exchange process and performance, air pollution.

Unit V: Safety of Human:

Dangerous machine (Regulation) act, Rehabilitation and compensation to accident victims, Safety gadgets for spraying, threshing, Chaff cutting and tractor & trailer operation etc.

AG408 Production Technology for Agril. Machinery

Course Description & Objectives:

To expose the student with the latest design procedures of agriculture machinery and their different components.

Course Outcomes:

On completion of the course, the students will understand:

1. *the basic production techniques and criteria for the selection of raw materials*
2. *the basic foundry and forgery techniques used for production of machinery.*
3. *the coating processes used for various machinery.*
4. *maintenance of quality and use of various standards for quality check.*

Unit 1: Application of Software in Agriculture Machinery Production:

Critical appraisal in production of Agricultural Machinery; Modelling and stress analysis of Machinery parts by using standard software;

Unit II: Materials used in Machinery:

Advances in material used for tractor & Agril. Machinery. Cutting tools including CNC tools and finishing tools. Advanced manufacturing techniques like powder metallurgy, EDM (Electro Discharge Machining), Heat Treatment of Steels.

Unit III: Coating Process of Metals:

Ferrous metallurgy, iron carbon diagram, alloying of elements, phase diagram, TTT diagram, surface treatment techniques: thermo chemical treatment including pack carburizing shot pining process, chemical vapour deposition (CVD) etc.

Unit IV: Production and Quality Control:

Limits, Fits & Tolerances, Jigs & Fixtures, Microstructure Analysis. Industrial layout Planning, Quality management, Economics of process selection. Techno economic feasibility of Project Report. Selection of Standard/ critical components.

Unit V: Manufacturing Process:

Case studies of manufacturing of Agril. Machinery. Servomotors, drives & controllers, CNC controllers for machine tools. CNC programming. Assembly and plant automation. Storage and transportation.

AG413 Mechanics of Tillage and Traction

Course Description & Objectives:

To present an overview of tillage and traction devices and systems to the students. To present fundamental concepts describing dynamic soil behavior in response to mechanical elements with methods for designing traction/ transport systems.

Course Outcomes:

After the competition of this course the student will be:

1. *able to measure and utilize physical and mechanical properties of soil.*
2. *Able to interpret and predict soil stress strain behavior.*
3. *able to design and implement safe and cost effective mechanical soil tillage systems*
4. *able to design and implement and cost effective mechanical traction/ transport systems*
5. *able to establish systems that produce specified performance and acceptable alteration of affected soil profiles.*

Unit 1: Mechanics of Tillage:

Introduction to mechanics of tillage tools, engineering properties of soil, principles and concepts, stress strain relationship,

Unit II: Design of Tillage Tools:

Design of tillage tools principles of soil cutting, design equation, force analysis, application of dimensional analysis in soil dynamics performance of tillage tools.

Unit III: Traction and Mechanics:

Introduction to traction and mechanics, off road traction and mobility, traction model, traction improvement, traction prediction,

Unit IV: Introduction of Tyre:

Tyre size, tyre lug geometry and their effects, tyre testing, soil compaction and plant growth,

Unit V: Application of GIS in Agriculture Machinery:

Variability and geo statistic, application of GIS in soil dynamics.

AG418 Environmental Engineering

Course Description & Objectives:

To understand nature, biodiversity, natural resources and facts about the environment and their interrelationships.

Course Outcomes:

On completion of the course, students will be able to:

1. *get fundamental concepts of environmental science*
2. *familiarize himself to protect the environment for better public utilization.*
3. *find and implement scientific, technological, economic and political solutions to environmental problems.*

Unit 1: Introduction to Water Supply System:

Importance of safe water supply system. Domestic water requirements for urban and rural areas.

Unit II: Water Supply:

Sources of Water supply. Intakes and transportation of water. Drinking water quality. Indian Standards of drinking water.

Unit III: Water Treatment:

Introduction to water treatment. Importance of sanitation. Domestic waste water: quantity, characteristics, disposal in urban and rural areas.

Unit IV: Design of Waster water:

Sewer: types, design discharge and hydraulic design. Introduction to domestic wastewater treatment. Design of septic tank. Solid waste: quantity, characteristics and disposal for urban and rural areas.

Unit V: Air Pollution:

Introduction to air pollution. Types of pollutants properties and their effects on living beings. ISI standards for pollutants in air and their abetments. Imparting awareness of domestic sanitation in women.

TEXT BOOKS:

AG412 Biomass Management for Fodder and Energy

Course Description & Objectives:

To impart the fundamental knowledge on the importance of Bio resources, Bio energy and reactors.

Course Outcomes:

At the completion of the course the student will have:

1. *knowledge and skills on bio energy source technology*
2. *understanding of important of biomass in agriculture fields.*
3. *knowledge on alcohol and ethanol production and energy and environment management.*
4. *skill about residue manag*ement in agriculture fields.

Unit 1: Introduction to Biomass:

Introduction to biomass management, biomass resource assessment management techniques/supply chains,

Unit II: Production of Biomass:

Processing of paddy straw, densification- Extrusion process, pellets, mills and cubers, Bailing-classification, uses;

Unit III: Residue Management for Soil Conservation:

Residue management for surface mulch and soil incorporation, Paddy Straw choppers and spreaders as an attachment to combine Harvester, Mulch seeder,

Unit IV: Fodder Management:

Paddy Straw Chopper-cum-Loader, Balar for collection of straw; Processing of straw/ fodder for animal use;

Unit V: Use of Biomass in other Production:

Agricultural and horticultural use, cushioning material for fruits and vegetables, Mulching and Composting, Paper and cardboard manufacturing, Straw as a fuel.

I SEMESTER

- 16HS101 - Basic Mathematics - I
- 16HS102 - Engineering Physics
- 16HS105 - Technical English Communication
- 16CS101 - Basics of Computers and Internet
- 16CS102 - Computer Programming
- 16EE101 - Basics of Engineering Products
- 16HS104 - English Proficiency and Communication Skills
- 16HS110 - Engineering Physics Laboratory

II SEMESTER

- 16HS106 - Basic Mathematics - II
- 16HS107 - Engineering Chemistry
- 16ME101 - Engineering Graphics
- 16EE102 - Basics of Electrical and Electronics Engg.
- 16HS111 - Engineering Chemistry Laboratory
- 16HS109 - Environmental Science and Technology
- 16BT102 - Bioproducts and Bioentrepreneurship
- 16ME103 - Workshop Practice

COURSE CONTENTS

I SEM AND II SEM

16HS101 BASIC MATHEMATICS - I

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	15	30	10	45	-	-	-	-

Course Description and Objectives:

In this course the fundamental concepts of mathematics are introduced. A treatise of Matlab is also introduced in the practical session.

The objective of the course is to impart knowlege on progressions, partial fractions and binomial theorem. This course also deals with elementary concepts in geometry, trigonometry, differential and integral calculus. Numerical methods are also introduced for finding approximate solutions of algebraic equations. Besides, interpolation techniques and MATLAB environment are emphasized.

Course Outcomes:

The student will be able to:

- apply arithmetic and geometric progressions.
- understand coordinate geometry and different forms of straight lines.
- use basic concepts of trigonometric ratios and identities.
- understand the concept of limit, continuity and differentiability.
- familiar with basic concepts of integration.
- find roots of algebraic and transcendental equations.
- apply some interpolation techniques.
- use some commands of Matlab for mathematical computations.

SKILLS:

✓ *Compute sum of terms of given progression.*

✓ *Differentiate the given function.*

✓ *Evaluate the integral of given function.*

✓ *Interpret interpolation techniques to estimate the functional values.*

ACTIVITIES:

- *Compute the derivative and compare with Matlab output.*
- *Evaluate the integral and compare with Matlab output.*
- *Interpet the given data and estimate the functional values at a given point.*

Unit - 1 **L-9, T-3**

MATHEMATICAL PRELIMINARIES: Progressions, partial fractions and binomial theorem.

Unit - 2 **L-9, T-3**

TRIGONOMETRY AND GEOMETRY: Coordinate system, straight line, trigonometric functions and trigonometric identities.

Unit - 3 **L-9, T-3**

DIFFERENTIAL CALCULUS : Limits, continuity and differentiability.

Unit - 4 **L-9, T-3**

INTEGRAL CALCULUS: Concepts of integration - rules, integration by parts, integration by partial fractions and integration by inspection (standard forms).

UNIT - 5 **L-9, T-3**

NUMERICAL METHODS: Bisection method, Newton-Raphson method, finite differences, forward and backward difference tables, interpolation by Lagrange's method, Newton's forward and backward methods, Gauss forward and backward methods.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Introduction to MATLAB environment.

Basic mathematical operations using MATLAB.

1. Solving simple expressions.
2. Trigonometric function values.
3. Limits.
4. Continuity.
5. Symbolic differentiation-1.
6. Symbolic differentiation-2.
7. Symbolic integration-1.
8. Symbolic integration-2.
9. Real roots of functions.
10. Newton-Raphson method.
11. Interpolation.

16HS102 ENGINEERING PHYSICS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	45	30	10	-	10

Course Description and Objectives:

Technology is the experimental information for the physicist, where the theories can be tested. Recent technical developments have been the results of collaboration of physicists and engineers.

Study of engineering physics is a unique opportunity to learn the fundamental concepts of physics and apply this knowledge to both scientific and engineering problems.

The present course deals with various fields such as lasers, optical fibres, photonics, nano and funcational materials, make the students to enrich basic knowledge in various fields of physics and apply the same in engineering fields.

Course Outcomes:

The student will be able to :

- understand the applications of ultrasonics and to calculate the velocity of ultrasonic waves in liquids.
- acquire basic knowledge in non-destructive techniques.
- understand basic concepts of laser and optical fibre which help in designing and developing new devices in emerging fields.
- grasp the basics of quantum mechanics.
- understand the fabrication of solar devices.
- use nanoscience and technology for innovative and compact design.
- demonstrate synthesis, properties and applications of nanomaterials and functional materials.

SKILLS:

✓ *Determine the velocity of ultrasonics in a given liquid using interferometer.*

✓ *Study the wavelengths of light sources and lasers.*

✓ *Estimate the efficiency of a given solar cell.*

✓ *Learn about the type of the optical fibre and their ability to propagate light waves from its numerical aperture.*

✓ *Know voltage – current characteristics of a given light emitting diode.*

UNIT - 1 **L-9**

ULTRASONICS : Introduction – production of ultrasonic waves, piezoelectric method, properties of ultrasonic waves, types of ultrasonic waves, determination of velocity of ultrasonic waves in solids and liquids; SONAR - medical applications.

NDT: Introduction- types, visual inspection and liquid penetrate testing; Ultrasonic testing systems; X - ray radiography.

UNIT - 2 **L-9**

LASERS : Characteristics of laser light – spontaneous and stimulated emission of radiation, He-Ne laser, CO_2 laser, semiconductor laser and applications.

HOLOGRAPHY: Holography and applications.

FIBER OPTICS : Principle of optical fibre – acceptance angle, numerical aperture, types of fibres, dispersion and attenuation in optical fibres, optical fibre communication system and fibre optic sensors.

UNIT - 3 **L-9**

QUANTUM MECHANICS : Introduction- matter waves, Schroedinger's time independent wave equation, physical significance of the wave function, particle in one dimensional potential well and tunneling phenomenon.

FREE ELECTRON THEORY OF METALS : Introduction – classical free electron theory, electrical conductivity of metal, quantum free electron theory, Fermi - Dirac distribution function and its variation with temperature

PARTICLE ACCELERATORS: Introduction- cyclotron, synchrocyclotron, betatron and applications.

UNIT - 4 **L-9**

SOLAR ENERGY: Solar radiation, photovoltaic effect, solar cells, efficiency of solar cell and solar thermal energy conversion systems.

PHOTONICS: LED, LCD, photo conducting materials, photo detectors, photonic crystals, non- linear optical behaviour of materials and applications.

UNIT - 5 **L-9**

NANO MATERIALS: Introduction, fabrication of nano materials, ball milling, sol-gel, physical and chemical properties of nano materials and applications.

FUNCTIONAL MATERIALS: Smart materials, shape memory alloys, chromic materials (thermo, photo and electro), metallic glasses, advanced ceramics, composites, fiber reinforced plastics/ metals and biomaterials.

TEXT BOOKS:

1. V. Rajendran, "Engineering Physics", 7th edition, TMH Publications, 2014
2. D.K. Bhattacharya and P. Tandon, "Engineering Physics", Oxford University Press, 2015.

REFERENCE BOOKS :

1. M.R. Srinivasan, "Engineering Physics", 1st edition, New Age International Publishers, 2008.
2. M.N. Avadhanulu and P.G. Kshirsagar, "Engineering Physics", 1st edition, S. Chand and Company Ltd, 1992.
3. S.P. Sukhatme, "Solar Energy", 2nd edition, TMH Publication, 2005.
4. Dr. Arumugam, "Materials Science", 3rd edition, Anuradha Publications, 2002.

ACTIVITIES:

- *Estimate acoustic impedance of a given material.*
- *Measurement of distances using ultrasonic range finder.*
- *Study of linear density of yarn/ fibre using Melde's experiment.*
- *Determination of refractive index of a given liquid using laser.*
- *Find height of a room using laser.*
- *Identify the type of semi-conductor using Hall effect.*
- *Study of numerical aperture of optical fibres made of different materials.*
- *Design of solar panel to obtain required voltage.*
- *Evaluate thermal conductivity of materials.*
- *Measure temperature using thermo couple.*

16HS105 TECHNICAL ENGLISH COMMUNICATION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	15	5	6	4	5

Course Description and Objectives :

To introduce students the specific use of English for the purpose of Technical Communication that would strengthen their skills in the areas of writing and speaking and thereby enable them to function effectively in their professional sphere. The teaching efforts in this course will be directed towards making students develop their technical writing skills in particular and overall language proficiency in general. It will be done by making students peruse good samples of technical writing covering a wide range of contemporary issues relevant to the engineering profession. Students will, also be revisiting, the fundamentals of grammar to get trained on use of standard English.

Course Outcomes:

The student will be able to :

- acquire an understanding of the rules of grammar.
- strengthen their reading and listening comprehension skills to follow the academic discourse in the engineering classroom.
- have a command of basic vocabulary related to different subject areas.
- have a grasp on the mechanics of writing and express their ideas through construction of simple texts.
- attain language proficiency to participate in the classroom discussions.

SKILLS:

✓ *Apply different sub skills like skimming, scanning, reading for information, reading for inference etc to understand different kinds of text.*

✓ *Apply different sub skills like top down, bottoms up approachs to listening, and understand phonetic and phonological features of the English language to deconstruct long spoken discourses.*

✓ *Use functional vocabulary relevant to subject areas like environment, tourism, engineering, technology and media to express ideas lucidly.*

✓ *Use appropriate sentence structure, cohesive devices and diction to construct simple text in writing and regular correspondence like e-mails, letters etc.*

✓ *Capture and understand key points during class room discourses through applying sub skills of writing like note-making, paraphrasing and summarizing.*

UNIT - 1 **L-9**

- Text : **Environmental consciousness**
  (Climate change, green cover, pollution, renewable vs. non renewable energy sources (from energy unit)
- Grammar : Articles, prepositions, sentence types and construction
- Vocabulary : Root, prefixes and suffixes
- Composition : Paragraph writing (descriptive and narrative)
- Laboratory Practice : Introduction to phonetics (Organs of speech- consonants, vowels and diphthongs; Syllable, stress and intonation)

UNIT - 2 **L-9**

- Text : **Emerging technologies**
  (Solar power, cloud computing, nanotechnology, wind energy (to be covered from energy unit)
- Grammar : Time and tense (Present, past and future; Helping verbs; Modals)
- Vocabulary : Synonyms and antonyms
- Composition : Letter writing (Informal)
- Laboratory Practice : Grammar practice (Speaking of past, present and future)

UNIT - 3 **L-9**

- Text : **Travel and tourism**
  (Advantages and disadvantages of travel, tourism, *atithi devo bhava* – Tourism in India)
- Grammar : Subject-Verb agreement and sentence construction
- Vocabulary : Idioms and Phrases
- Composition : Letter writing (Formal)
- Laboratory Practice : Situational conversations – Role plays (Introducing, greeting, enquiring, informing, requesting and inviting)

UNIT - 4 **L-9**

- Text : **Engineering Ethics**
  (Challenger disaster, biotechnology, genetic engineering, protection from natural calamities, how pertinent is the nuclear option? An
  environment of energy (from energy unit)) Avoiding sexist language (Gender sensitization)
- Grammar : Sentence transformation (Degrees, voice, speech and synthesis)
- Vocabulary : Phrasal verbs
- Composition : Note-making on Nandan Nilekani's "In search of our energy solutions" (from energy unit) Summarizing on

ACTIVITIES:

- *Doing phonetic transcription of selected words from the list provided using talking dictionaries of AHD and CALD.*
- *Complete graded grammar exercises in Rosetta Stone.*
- *Complete graded listening and reading comprehension exercises in Rosetta Stone.*
- *Watch TED videos and making notes.*
- *Watch TED videos to paraphrase and summarize.*
- *Ad- making.*
- *Prepare brochure.*
- *Dialogue writing followed by role play.*
- *Poster designing.*
- *Team presentation with PPTs and group discussion.*

			"Flight from conversation" (New York Times)
•	Laboratory Practice	:	Situational conversations – Role plays (Emotions, directions, agreements, refusals and suggestions).

UNIT - 5 **L-9**

•	Text	:	**Media matters** (History of media, language and media, milestones in media, manipulation by media, thousands march against nuclear power in Tokyo (from energy unit), entertainment media and interviews)
•	Grammar	:	Common errors
•	Vocabulary	:	One-word substitutes
•	Composition	:	E-mail, short message service (SMS), writing advertisements, reporting; Social Media- blogging, facebook, twitter (acceptable and non acceptable content)
•	Laboratory Practice	:	Group discussions (topics from energy unit) – Dumping of nuclear wastes, exploration of eco-friendly energy options, lifting of subsidies on petrol, diesel, LPG etc)

16CS101 BASICS OF COMPUTERS AND INTERNET

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course provides students with a working knowledge of the terminology, processes and components associated with computers and internet. Students will get exposure to building blocks of computers, operating systems, application software, networking, internet, world wide web, security, maintenance, information systems and the application development processes.

Course Outcomes:

The student will be able to :

- understand the terms and concepts of computer science and information technology (hardware, software, networking, security, internet/web and technologies).
- use the products and services of computers.
- use internet/web services as a resource for developing shared applications.
- install different operating systems and application software.

SKILLS:

- ✓ *Assemble and disassemble the personal computer system.*
- ✓ *Install different desktop operating systems.*
- ✓ *Use the basic text processing, simple data analysis and data presentation tools.*
- ✓ *Configure network parameters.*
- ✓ *Secure the personal computer and information from various external threats.*

UNIT - 1 **L-10**

COMPUTING SYSTEMS : Introduction to computer, computers for individuals, importance of computers, parts of computer system, memory devices, input and out devices, types of monitors, types of printers, number systems, bits and bytes, text codes and types of processors.

UNIT - 2 **L-10**

OPERATING SYSTEMS : Types of operating systems, user interfaces, PC operating systems, network operating systems, types of software, programming languages, compiler and interpreter, program control flow and algorithm.

UNIT - 3 **L-8**

NETWORKS AND DATABASES : Networking basics, uses of network, types of networks, network hardware, introduction to data bases and database management systems.

UNIT - 4 **L-8**

INTERNET AND WWW : Internet's services, world wide web, browser setups, using search engine, email and other internet applications.

UNIT - 5 **L-9**

CYBER SECURITY : The need of computer security, basic security concepts, threats of users, online spying tools, threats to data, cybercrime and protective measures.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- know the usage of the computer systems.
- setup the IDEs for the computer programming languages.
- get exposure on office automation tools like Microsoft Word, Excel, and power point.
- identify the different computer system and data threats and also protect them by installing antivirus software.

LIST OF EXPERIMENTS Total hours: 30

1. Demonstrate the personal computer peripherals and get a report on each peripheral.
2. Demonstrate the personal computer assembling procedure and do the same.
3. Install wide varieties of free and open source operating systems.
4. Demonstrate network interface card (NIC) configuration and any internet browsers options setup.
5. Demonstrate the Java development kit (JDK) installation and environmental variable (PATH) setup.
6. Demonstrate the following experiments using Office automation tools
   a. Text formatting and table.
   b. Mathematical equations.
   c. Watermarking using analysis tool.

ACTIVITIES:

- *Prepare a report on various generations of computers and their peripherals.*
- *Disassemble and assemble of a personal computer system.*
- *Install the Linux operating system and other software required in a personal computer system.*
- *Connect the system to an ethernet and configure the same.*
- *Prepare an MS word document.*
- *Prepare a spread sheet with various mathematical operations, charts, sorting etc.*
- *Make a report on power point presentation for the given topic.*

   d. Calculate student mark details.
   e. Create four types of charts.
   f. Import external data, sort and filter using powerpoint tool.
   g. Create text and images with effects.
   h. Create animation and sound effects.
7. Demonstrate the installation of anti-virus software to detect different types of virus programs.

TEXT BOOK :

1. P. Norton, “Introduction to Computers”, 7th edition, Tata-McGraw Hill, 2010.

REFERENCE BOOKS:

1. ITL Education Solution Limited, “Introduction to Computer Science”, 2nd edition, Pearson Education, 2011.
2. E. Maiwald, “Fundamentals of Network Security”, 3rd edition, Tata-McGraw Hill, 2004.

16CS102 COMPUTER PROGRAMMING

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	5

Course Description and Objectives:

This course is aimed at offering fundamental concepts of programming language to the students. It starts with the basics of C-programming and deals with the structure and various attributes required for writing a 'C' program. It also introduces various operators and control statements used in programming. Then it switches to functions and arrays. It goes on with strings, pointers, files and the user defined data types. As a first-level course in computer science, it forms the basis to understand usage of various attributes in writing a program.

Course Outcomes:

The student will be able to :

- understand the basic terminology used in computer programming to write, compile and debug programs in 'C' language.
- use different data types to design programs involving decisions, loops and functions.
- understand the allocation and usage of dynamic memory.
- understand the usage of files and structures.

SKILLS:

- ✓ *Identify suitable data types for an application.*
- ✓ *Apply control statements for decision making problems.*
- ✓ *Use multidimension array for matrix application.*
- ✓ *Design a program to calculate average of a class.*
- ✓ *Analyze the difference between static and dynamic memory allocation.*

UNIT - 1 **L-9, T-3**

INTRODUCTION TO C PROGRAMMING : Structure of C program- comments, processor statement, function header statement, variable declaration statement and executable statement; C character set - constants, identifiers, operators, punctuations, keywords, modifiers, identifiers, variables, c scopes, basic data types, type qualifiers, storage classes, reading and writing characters and formatted I/O.

UNIT - 2 **L-9, T-3**

OPERATORS AND CONTROL STATEMENTS : Operators- assignment, arithmetic, relational, logical, bitwise, ternary, address, indirection, size of, dot, arrow and parentheses operators; Expressions precedence of operators and associative rules; Control statements- category of statements, selection, iteration, jump, label, expression and block.

UNIT - 3 **L-9, T-3**

FUNCTIONS AND ARRAYS : Function- declaration, prototype, definition, calling by value and call by address, standard library functions and recursive functions; Array- declaration, initialization, reading, writing, accessing and passing as a parameter to functions, 2D-arrays and multidimensional arrays.

UNIT - 4 **L-9, T-3**

STRINGS AND POINTERS : Strings- declaration, string library functions, array of strings and command line arguments; Pointers- declaration, initializing pointers, multiple indirection, relationship between arrays and pointers; Scaling up- array of arrays, array of pointers, pointer to a pointer, pointer to an array; pointer to functions and dynamic memory allocation functions.

UNIT - 5 **L-9, T-3**

STRUCTURES AND FILES : Structures - declaration, initialization and accessing, array of structures and passing structures to functions, structure pointers, arrays and structures within structures, unions, bit-fields, types and enumerations; Files - I/O and processing operations on text and binary files; Pre-processor directives.

LABORATORY EXPERIMENTS

Course Outcomes:

Upon successful completion of this course, the student will be able to:

- write, compile and debug programs in C language.
- formulate problems and implement algorithms in C.
- choose programming components that efficiently solve computing problems in real-world.

LIST OF EXPERIMENTS Total hours: 30

1. Compute the factors of a number.
2. Compute the average of 'n' numbers.
3. Find whether a number is palindrome or not.
4. Find whether a number is a power of 2 or not.
5. Compute the factorial of a number.
6. Implement any kind of operation (+,-,*,/,%) using a switch case.

ACTIVITIES:

- *Implement matrix operations.*
- *Implement malloc and calloc functions.*
- *Copy the content of one file into the other.*
- *Implement string manipulations functions.*

7. Swap two values useing call by value and call by reference.
8. Using structure of arrays.
9. Find the reversal of a number.
10. Find the frequency of each number in the array.
11. Which takes 0’s and 1’s as input and the array should consist of all 0’s first and then 1’s.
12. Copy the first 10 words of a file into the other file.
13. Count the number of words in a file.
14. Create a structure which stores the student’s information in a class.
15. Reverse the contents of the array.
16. Implement pointer of pointers.
17. Give n^{th} term of the Fibonacci number.
18. Find the factorial of a number using recursion.
19. Find the number of vowels in a file.
20. Access the structure and union members.

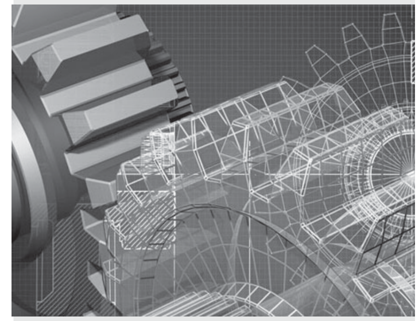
16EE101 BASICS OF ENGINEERING PRODUCTS



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course enables the students to understand the basics of civil, mechanical, electrical and electronics systems and components used in day-to-day life. It deals with construction materials, power generation principles and working of a few commonly used household appliances. Besides, the student will be able to identify/appreciate various concepts, service and maintainance of engineering products.

Course Outcomes:

The student will be able to:

- gain knowledge and hands-on experience on various engineering products.
- install, operate, maintain and troubleshoot basic mechanical, electrical and electronic appliances.
- understand the concept of conservation of energy.
- gain awareness on choosing appropriate construction materials.

SKILLS:

✓ *Identify UPS requirements for a given load.*

✓ *Provide a lighting scheme for specific working environment.*

✓ *Design a composition of hHeating element for a particular application.*

✓ *Troubleshoot issues relating to immersion heater and induction heater.*

✓ *Provide an earthing for domestic outlet.*

✓ *Select, configure and maintain a few engineering appliances such as TV, radio, telephone, mobile phone, wifi router, micro oven, PA system, etc.*

ACTIVITIES:

- *Trouble shooting of immersion heater and induction heaters.*
- *Disassemble and Assemble of Domestic Appliances such as Mixer Grinder, Fan etc.,*
- *Provide Earthing for Domestic Outlet.*
- *Design Electric Wiring system for a prototype house.*
- *Design UPS for a defined load.*
- *Practice assembly of a FM radio.*
- *Configure a Wifi Router for required number of users.*

UNIT - 1 **L-9**

WORKING PRINCIPLE OF AC, REFRIGERATOR, PUMPS, IC ENGINES AND SCREW JACK: Working principle of air-conditioner and refrigerator- components, assembly and disassembly, working principle of centrifugal and reciprocating pumps; Types, parts and applications, working principle of screw jack and its components; Working principle of IC engines- 2 stroke and 4 stroke.

UNIT - 2 **L-10**

BRICKS : General, qualities and classification of bricks; Tests for bricks; Size and weight of bricks;

Timber- definition, qualities of good timber, decay of timber and advantages of timber in construction.

CEMENTS : Types and composition of cement, setting of cement, tests for physical properties of

cement, and different grades of cement.

AGGREGATES : Classification of aggregates, source, size and shape of aggregates; Tests for aggregates.

STEEL: Types of steel, physical properties and mechanical properties of steel.

Simple layout design, paints, tiles, fittings, ventilation, furniture and green house aspects.

UNIT - 3 **L-8**

ELECTRIC ENERGY SYSTEMS : Overview of power system structure; Conventional and non conventional generations - types of turbines, generators, substations, towers, earthing procedure, protection schemes, single phase and three phase systems.

Methods of electrical wiring systems - wiring procedure and calculations; Wiring methods.

Uninterruptible power supply (UPS)- components in UPS, its functionality and calculation of ratings for UPS components to a specific load.

UNIT - 4 **L-10**

LIGHT : Light energy, evolution of light sources, working of incandescent, fluorescent, MV, SV and LED lamps, comparison and applications.

HEAT : Heat energy, modes of heat transfer, resistance and induction heating, comparison and applications.

MOTOR : Electric motors, classification, construction and working principles of motors used in domestic applications, mixer grinder, ceiling and exhaust fan, hair dryer, washing machine, water pump, air coolers, vacuum cleaner, computer cooling motor and electric bike.

UNIT - 5 **L-8**

HOUSE HOLD ELECTRONIC APPLIANCES: Working principles of television, radio, remote control, telephone, microwave oven, cell phone, PA system, induction stove, wifi router and DTH.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Demonstration of Modelling / functioning / disassembly / assembly / fault rectification / understanding of the following.

1. Air-conditioners and Refrigerators
2. 2 Stroke and 4 Stroke Engines
3. Reciprocating Pumps
4. Power Screw Jack
5. Size and Water absorption capacity of Bricks
6. Initial and final setting time of Cement
7. Toughness value of coarse aggregates
8. Bulking of Sand
9. Earthing Schemes
10. Electric Wiring
11. UPS system
12. Immersion Heater, Induction Heater and Iron Box.
13. Ceiling Fan and Mixer.
14. Television

15 Radio

16. Remote Control
17. Telephone
18. Fax Machine
19. Mobile Phone
20. PA System

16HS104 ENGLISH PROFICIENCY AND COMMUNICATION SKILLS

Hours Per Week :

L	T	P	C
0	-	2	1

Total Hours :

L	T	P
0	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To equip students with Functional English by exposing them to a wide range of language use in different contexts and thereby encourage them to use the language comfortably in real life situations. Students will strengthen their comprehension skills of listening and reading by acquiring adequate vocabulary through perusing authentic materials gathered from news papers, journals and other mass communication media.

Course Outcomes:

The student will be able to :

- use functional English to speak and express themselves in different social contexts
- write simple letters, narratives, factual reports and descriptive passages for both academic and non-academic purposes in English.
- gain proficiency to undergo Preliminary English Test (PET), an Intermediate Level English Certification Test administered by Cambridge English Language Assessment, UK.

SKILLS:

- ✓ *Use appropriate words in right order for effective sentence formation, and writing short texts.*
- ✓ *Read and extract information from different texts & draw inferences by understanding elements like tone and transitional words.*
- ✓ *Understand short and long spoken discourses through analysis of elements like stress and intonation.*
- ✓ *Articulate clearly thoughts and ideas on simple every day topics.*

UNIT - 1 **P-6**

Functions : Introducing self/others; Expressing needs/feelings/opinions (SWOT Analysis)

Skill Focus:

Reading	–	Understanding factual information
Writing	–	Word order and sentence formation
Listening	–	Decoding for meaning following elements of stress, intonation and accent
Speaking	–	Articulating syllables clearly, speaking fluently with correct pronunciation
Vocabulary	–	Discerning to use right word for the given context
Grammar	–	Spellings, use of nouns, adjectives, verbs, prepositions in the sentence structure

Practice : Objective PET Units 1 - 6

UNIT - 2 **P-6**

Functions : Defining and describing people, places, things and process.

Skill Focus:

Reading	–	Inferences from sentences and short messages – true/false
Writing	–	Rewording, sentence transformation and convincing
Listening	–	Understanding the short messages and conversations
Speaking	–	Role plays and short conversations
Vocabulary / Grammar	–	Use of adjectives/adverbs, comparatives and superlatives

Practice : Objective PET Units 7 – 12

UNIT - 3 **P-6**

Functions : Describing spatial and temporal relations; Giving directions/ instructions

Skill Focus :

Reading	–	Reading between the lines, inferences, true/false
Writing	–	Developing hints - Writing short messages/paragraphs
Listening	–	Searching for factual information - Gap filling
Speaking	–	Snap talks, JAM and elocution

Vocabulary / Grammar – Prepositions, phrasal verbs; PET word list

Practice: Objective PET Units 13 - 18

UNIT - 4 **P-6**

Functions : Narrating, predicting, negotiating and planning

ACTIVITIES:

- *SWOT Analysis.*
- *Snap talks.*
- *Spell Bee.*
- *Short conversations.*
- *Role play.*
- *Quiz.*
- *Elocution.*
- *JAM.*
- *Group. Discussion Debate.*
- *Team presentations.*

Skill Focus:

Reading – Reading for evaluation and appreciation, comprehension

Writing – Letters – e-mails – 7 C's

Listening – Following long conversations/interviews

Speaking – Discussions, debate and descriptions

Vocabulary / Grammar – Modals, conditionals and verb forms (time and tense)

Practice : Objective PET Units 19 – 24

UNIT - 5 **P-6**

Functions : Requesting, denying, suggesting and persuading

Skill Focus:

Reading – Understanding factual information

Writing – Short stories and explanatory paragraphs

Listening – Inferences from long speeches/conversations

Speaking – Announcements and presentations

Vocabulary / Grammar – Punctuation and cloze tests

Practice : Objective PET Units 25 – 30

TEXT BOOK:

1. L. Hashemi and B. Thomas, "Objective PET", Student's Book with Answers, 2nd edition, Cambridge University Press, 2015.

REFERENCE BOOKS :

1. Cambridge Preliminary English Test Without Answers 8.

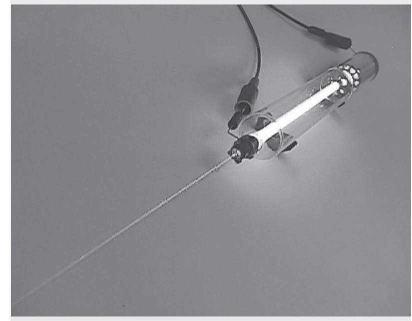
16HS110 ENGINEERING PHYSICS LABORATORY



Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course Description and Objectives:

This lab is intended to make the students realize the theoretical concepts of physics having hands on experience in conducting the following experiments.The students have to perform at least 10 experiments from the list of experiments.

Course Outcomes:

The student will be able to :

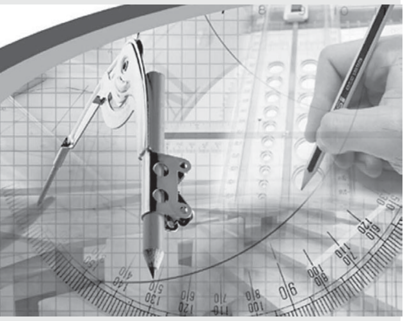
- realize the concept of resonance by conducting the experiments of AC sonometer and Melde's experiment.
- acquire the knowledge on magnetic field theory, thermal conductivity by conducting experiments of field along the axis of a circular coil and thermal conductivity of bad conductor
- understand the concepts of light by conducting the experiments of determination of wave length, numerical aperture of an optical fibre and also from V–I characteristics of Solar cell and LED.

LIST OF EXPERIMENTS

1. Determination of velocity of ultrasonic waves in liquids.
2. Melde's experiment - transverse and longitudinal modes.
3. Determination of wave length – Helium - Neon laser.
4. Determination of Planck's constant.
5. Determination of Frequency of alternating current.
6. Field along the axis of a circular coil – Stewart and Gee's apparatus.
7. Band gap of semiconductor.
8. Hall coefficient.
9. Thermal conductivity of bad conductor - Lee's method.
10. Optical Fibre – Determination of numerical aperture.
11. Solar Cell – efficiency.
12. Study of V – I characteristics of LED.
13. Seebeck effect.

REFERENCE BOOKS :

1. Jayaraman, "Engineering Physics Laboratory manual", 1st edition, Pearson Education, 2014.
2. Engineering Physics Laboratory Manual – Department of Physics, VFSTR University, 2016.



16HS106 BASIC MATHEMATICS – II

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

This course offers basic concepts on matrices, system of equations, differential equations of first and higher order. Further, numerical methods to solve differential equations are introduced.

The objective of the course is to provide the knowledge on the properties of matrices and solving system of equations using matrices. It is also aimed to offer various methods (analytical as well as numerical) to solve first and second order ordinary differential equations.

Course Outcomes:

The student will be able to :

- understand the basic concepts, properties and operations on matrices.
- determine when a system of equations is consistent or not and solve it whenever possible.
- determine when the matrix has an inverse and find it when it exists.
- identify the method to solve the differential equations.
- find the complete solution of a homogeneous and non homogenerous differential equations with constant coefficients.
- evaluate integrals and solving differential equations using numerical methods.
- compare the solutions of differential equations by numerical methods with exact solution of that equation using MATLAB.

SKILLS:

✓ *Compare the inverse of matrix.*

✓ *Solve given system of linear equations.*

✓ *Solve given differential equations.*

Unit - 1 **L-9, T-3**

MATRICES: Definition, types of matrices, algebra of matrices, determinant, minor, cofactor, adjoint, and inverse of a matrix; Elementary row operations, inverse by row operations, rank, determination of rank using Echelon form and normal form.

Unit - 2 **L-9, T-3**

SYSTEM OF EQUATIONS: System of linear equations, consistency of system of equations, solution by Cramer's rule, matrix inversion method, Gauss-Jordan method and Gauss elimination method.

Unit - 3 **L-9, T-3**

FIRST ORDER ORDINARY DIFFERENTIAL: Introduction, variable separable, linear equations, Bernoulli equation, homogenous equations and non-homogenous equations.

Unit - 4 **L-9, T-3**

SECOND ORDER ORDINARY DIFFERENTIAL EQUATIONS : Linear differential equations of second order with constant coefficients with RHS of type e^{ax}, $\sin ax$, $\cos ax$, x^n.

UNIT - 5 **L-9, T-3**

NUMERICAL METHODS - II: Numerical integration by trapezoidal rule and Simpson's rules; Numerical solutions to Differential equations - Euler's method and Runga-Kutte method.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Matrix algebra.
2. Rank of a matrix.
3. System of equations (Direct method).
4. System of equations (Cramer's rule).
5. System of equations (Matrix inversion method).
6. Solutions of first order ODE.
7. Trapezoidal rule.
8. Simpson's one-third rule.
9. Simpson's three-eight rule.
10. Euler's method.
11. RK Method.

TEXT BOOKS :

1. H. K. Dass and Er. R. Verma, “Higher Engineering Mathematics”, S. Chand and Co., 3rd edition, 2014.
2. B. S. Grawel, “Engineering Mathematics”, Khanna Publishers, 44th edition, 2014.

Reference BookS :

1. K. S. Rao, “Numerical Methods”, 3rd edition, PHI Publishers, 2007.
2. R. Pratap, “Getting started with MatLab”, Oxford University Publication, 2009.

ACTIVITIES:

- *Compute the inverse of matrix and compare with MATLAB output.*
- *Solve given system of linear equations and compare with MATLAB output.*
- *Solve given differential equations and compare with MATLAB output.*

16HS107 ENGINEERING CHEMISTRY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	-	10	-	-

Course Description and Objectives:

This course aims to develop fundamental knowledge on new engineering materials and their significance in science and engineering applications. In addition, characterization of materials using basic and advanced experimental techniques is also offered. Besides, analysis of water sample and treatment method for domestic, commercial and industrial applications are also covered.

Course Outcomes:

The student will be able to :

- understand the limitations of using hard water for domestic and industrial purposes.
- choose and apply suitable methods to soften the hard water for industrial and domestic applications.
- understand electrochemistry and its importance for applications such as fuel cells, modern lithium ion batteries etc.
- understand the types of corrosion and their implications followed by their control and prevention methods.
- familiarize the preparation, properties and applications of various polymers.

SKILLS:

✓ *Analyse the total hardness of water sample.*

✓ *Understand the basic principles involved in various batteries.*

✓ *Understand the mechanisms of corrosion and various controlling methods.*

✓ *Synthesize various polymers.*

✓ *Identify the functional groups present in chemical compounds using Infrared and Ultraviolet instruments.*

UNIT - 1 **L- 9**

WATER TECHNOLOGY : Introduction, WHO, BIS standards of water; Hardness of water-determination of hardness by EDTA (numerical problems), disadvantages of hard water, scales and sludges, caustic embrittlement, boiler corrosion, priming and foaming; Softening methods - zeolite process, ion exchange process; Desalination of brackish water- reverse osmosis and electrodialysis.

UNIT - 2 **L- 9**

ELECTRO CHEMISTRY: Electrode potential; Electrochemical series; Nernst equation; Reference electrodes - Calomel and standard hydrogen electrode, ion selective electrode and glass electrode; Determination of pH by pH meter, primary cell and secondary cell (lead-acid storage cell and lithium ion battery); Fuel cell - hydrogen oxygen and methanol oxygen.

UNIT - 2 **L- 9**

SCIENCE OF CORROSION : Introduction, dry corrosion, wet corrosion and mechanisms of wet corrosion; Bimetallic corrosion - concentration cell corrosion; Factors influencing the rate of corrosion; Corrosion control methods - cathodic protection, electroplating, electrolessplating and corrosion inhibitors.

UNIT - 4 **L- 9**

POLYMERS: Introduction; Types of polymerization - preparation, properties and applications of polyethylene, PVC, teflon, bakelite, urea, formaldehyde and silicones; Rubber – vulcanization; Synthetic rubbers - buna-S, buna-N and neoprene; Introduction to conducting polymers - poly thiophene.

UNIT - 5 **L- 9**

INSTRUMENTAL TECHNIQUES: Interaction of radiation with matter, UV - Visible Spectroscopy, Beer - Lambert's law, qualitative and quantitative analysis; Block diagram of UV-Visible spectrophotometer; IR Spectroscopy - types of vibrations and block diagram of IR spectrophotometer.

TEXT BOOKS :

1. P.C Jain and M. Jain, "Engineering Chemistry", 17th edition, Dhanpat Rai Publications, 2010.
2. S. Chavala, "A Text book of Engineering Chemistry Engineering Materials and Applications", 3rd edition, Dhanpat Rai Publications, 2015.

REFERENCE BOOKS:

1. K.S. Maheswaramma and M. Chugh, "Engineering Chemistry", 1st edition, Pearson publication, 2015.
2. M.R. Senapati, "Advanced Engineering Chemistry", 2nd edition, Lakshmi Publications, 2006.
3. H. W. Wilard and DeMerit, "Instrumental methods of Analysis", 7th edition, CBS Publications,1986.
4. G. Raj and C. Anand, "Instrumental Methods of Analysis", 5th edition, Himalaya Publications, 2007.
5. J.D. Bares, M.Thomas, B. S. Sankar, J.Mendham and R.C Denney, "Vogel's Text book of Qualitative Chemical Analysis", 6th edition, Pearson Publications, 2009.
6. Dr.S. Rattan, "Experiments in Applied Chemistry", S.K. Kataria and Sons Publications, 2008.

ACTIVITIES:

- *Collect water samples from different villages near VFSTR University and determine the total hardness, and total alkalinity.*
- *Present the water analysis report to the villagers and suggest proper measures to be taken.*
- *Measure the rate of corrosion of iron objects by weight loss method.*
- *Identify some of the functional groups like carboxylicacid, aldehyde and ketones by I.R. Spectroscopy.*
- *Collect water sample from different villages and estimate the fluoride present in the raw water and suggest some steps for the removal of fluoride.*

16ME101 ENGINEERING GRAPHICS

Hours Per Week :

L	T	P	C
1	-	3	3

Total Hours :

L	T	P
15		45

WA/RA	SSH/HSH	CS	SA	S	BS
6	15	-	5	-	-

Course Description and Objectives:

The main aim of this course is to familiarize the students with the conventional concepts of engineering drawing and computer aided applications in various fields. Engineering graphics is an "International language of Engineers". It is the most effective method of communicating technical ideas in 2D and 3D format.

Course Outcomes:

The student will be able to :

- sketch engineering objects in the freehand mode.
- create geometric construction with hand tools.
- create dimensions of objects.
- prepare plan and elevation of any pictorial view.
- draw freehand lettering.
- make isometric sketches using graphics.
- draw orthographic multi-view sketches using graphics.

SKILLS:

✓ *Draw free hand sketches, layouts, circuit diagrams, plan and elevations.*

✓ *Draw geometrical objects like polygons, solids of different types.*

✓ *Visualize the objects in real time situations.*

✓ *Develop 3D views (isometric views).*

UNIT - 1 **L-3, P-10**

INTRODUCTION TO ENGINEERING DRAWING: Introduction to engineering drawing- types of lines, lettering, dimensioning, construction of polygon and conics (ellipse, parabola and hyperbola by general method) and ellipse by oblong method.

UNIT - 2 **L-3, P-8**

ORTHOGRAPHIC PROJECTIONS: Principle of projection-planes of projections, projections of points, projection of straight lines; Inclined to one plane and both the planes; Projections of planes; Simple planes; Planes inclined to one reference planes.

UNIT - 3 **L-3, P-8**

PROJECTIONS OF SOLIDS: Projections of prisms, pyramids, cylinders, cones and solid axis inclined to one plane.

UNIT - 4 **L-3, P-10**

AUTOCAD: Introduction to AutoCAD

ISOMETRIC VIEWS: Isometric drawing of simple objects; Isometric view of prisms; Pyramids; Cone and cylinder; Simple orthographic views into isometric views through AutoCAD.

UNIT - 5 **L-3, P-9**

ORTHOGRAPHIC VIEWS: Conversion of pictorial views into orthographic views through AutoCAD.

TEXT BOOKS :

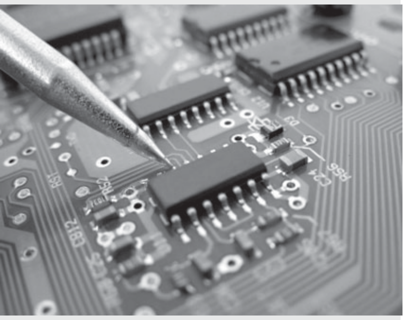
1. N.D.Bhatt, "Engineering Drawing", 53rd edition, Charotar Publication, 2014.
2. B.Agrawal and C.M.Agrawal, "Engineering Drawing" , 2nd edition, Tata McGraw Hill, 2014.

REFERENCE BOOKS :

1. J. Hole, "Engineering Drawing", 2nd edition, Tata McGraw Hill, 2008.
2. K.L. Narayana, "Engineering drawing", 2nd edition, Scitech Publications, 2008.

ACTIVITIES:

- *Draw line diagram of different machineries.*
- *Draw plan and elevations of buildings and engineering products.*
- *Understand, visualize 3-D components/ products and develop drawings.*
- *Draw different curves used in several engineering applications such as bridges, dams etc.*



16EE102 BASICS OF ELECTRICAL AND ELECTRONICS ENGINEERING

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	5

Course Description and Objectives:

This course provides an in-sight into the functioning of basic electrical components like resistor, inductor and capacitor. It deals with the constructional and operational details of both DC and AC machines. It also deals with the basic electronic components like P-N junction Diode, Zener diode, transistor and their characteristics.

Course Outcomes:

The student will be able to:

- understand the notation and usage of components in electric circuits.
- analyze AC (single and three phase) and DC using different methods and laws.
- operate various electrical machines.
- understand the concepts of semiconductor devices and their operation.

SKILLS:

- ✓ *Distinguish between linear and nonlinear elements by looking at VI characteristics.*
- ✓ *Develop a simple loop generator.*
- ✓ *Design a voltage regulator using Zener diode.*
- ✓ *Design a half wave rectifier using PN junction diode.*
- ✓ *Design a full wave rectifier using PN junction diodes.*

UNIT - 1 **L-9**

FUNDAMENTALS OF DC CIRCUITS: Circuit Concepts; Concepts of network- active and passive elements, voltage and current sources, concept of linearity and linear network, unilateral and bilateral elements, R, L and C as linear elements; Ohm's Law; Kirchhoff's Laws; Application to simple series, parallel circuits, mesh and nodal analysis of simple resistive circuits (simple numerical problems).

UNIT - 2 **L-9**

FUNDAMENTALS OF AC CIRCUITS: Generation of AC voltage - frequency, average value, RMS value, form factor, peak factor for sinusoidal only; Phasor representation of alternating quantities; Analysis of simple series and parallel AC circuits (simple numerical problems).

BALANCED THREE PHASE SYSTEMS: Relation between phase and line quantities of voltages and currents in star and delta connected systems (elementary treatment only).

UNIT - 3 **L-9**

FUNDAMENTALS OF ELECTROMAGNETISM: Concepts of magneto motive force, reluctance, flux and flux density, concept of self Inductance and mutual Inductance, coefficient of coupling (only elementary treatment and simple numerical problems).

TRANSFORMERS: Principle of operation of single phase transformer, constructional features, EMF equation (simple numerical problems).

UNIT - 4 **L-9**

DC MACHINES: Constructional details of a DC machine, DC generator, principle of operation; EMF equation, types of DC generators (simple numerical problems).

DC motor- principle of operation, torque equation, types of DC motors (simple numerical problems)

AC MACHINES: Principle of operation of three phase induction motors, slip ring and squirrel cage motors, torque equation, constructional details of synchronous machine.

UNIT - 5 **L-9**

SEMICONDUCTOR DEVICES: Classification of solids based on energy band theory; Intrinsic and extrinsic semiconductors, P-type and N-type semiconductors, P-N junction diode and its characteristics; Half and full wave rectifiers; Zener diode and its characteristics; Voltage regulator; Bi polar junction transistor, operation, types and applications.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Verification of Ohm's law.
2. Verification of Kirchhoff's current law.
3. Verification of Kirchhoff's voltage law.
4. Measurement of energy in single phase resistive load circuit.
5. Measurement of Power in single phase resistive load circuit.
6. Transformation ratio of a single phase transformer at different loads.
7. Verification of PN junction diode characteristics under both forward and reverse bias.
8. Verification of Zener diode characteristics under both forward and reverse bias.
9. Implementation of half wave rectifier without filter.
10. Implementation of full wave rectifier without filter.

ACTIVITIES:

- *Decode the value of resistors.*
- *Design and fabricate a simple loop permanent magnet generator.*
- *Design and fabricate a simple air cored transformer.*
- *Fabricate full and half wave rectifiers using PN junction diodes.*
- *Fabricate a voltage regulator using Zener diode.*

16HS111 ENGINEERING CHEMISTRY LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course Description and Objectives:

This course is aimed at enlightening the importance of theoretical concepts of chemistry and experimental techniques for characterization of materials.

Course Outcomes:

The student will be able to :

- analyse the total hardness present in water samples.
- determine the total alkalinity of water used in industries.
- acquire the knowledge on polymers used as insulators.
- familiarize advanced techniques in chemical analysis using conductometer and pH meter.

LIST OF EXPERIMENTS

1. Determination of total alkalinity of water.
2. Estimation of total hardness of water.
3. Find the percentage of available chlorine in bleaching powder.
4. Estimation of Fe (II) by dichrometry method.
5. Preparation of phenol - formaldehyde resin.
6. Synthesis of urea- formaldehyde resin.
7. Estimation of concentration of acid by pH metry.
8. Determination of strength of acid by conductometry.
9. Measurement of Mn^{+7} by colorimetry.
10. Determination of concentration of a salt by ion exchange method.
11. Find the concentration of Mn^{+7} and Cr^{+6} by UV-visible spectrophotometry.
12. Find the rate of corrosion by weight loss method.

TEXT BOOKS :

1. J.Mendham, R.C.Denney, J.D. Bares, M.Thomas and B.S. Sankar, “Vogel’s Text book of qualitative Chemical Analysis”, Volume I, Pearson Publications, 2009.

16HS109 ENVIRONMENTAL SCIENCE AND TECHNOLOGY

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P
30	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	20	4	-	4	-

Course Description and Objectives:

Environmental science and technology offers technological aspects of environmental science and in maintaining environmental integrity in relation to human development. It helps every engineer to plan appropriate strategies for addressing environmental issues and also contribute to the development of innovative technologies for solving such issues. It produces professionals who will ensure sustainable development of the nation in general and environmental in particular.

Course Outcomes:

The student will be able to :

- observe and integrate the diverse information from sources outside the classroom.
- think critically, creatively, resourcefully and strategically, including identifying steps needed to reach goals, manage projects, evaluate progress, and adapt approaches, developing both self reliance and civic mindedness.
- adapt eco-friendly technologies in order to maintain hygienic conditions.
- understand the human activities that are detrimental to environment.
- collaborate across diverse disciplines to identify and create solutions that conserve and help maintain biodiversity in the long term.
- discuss the issues involved in the generation of renewable energy resources.

SKILLS:

- ✓ *Understand structural relationships, abstract models, symbolic languages and deductive reasoning.*
- ✓ *Gain perspectives to adrress the challenges, improvise and devise solutions.*
- ✓ *Identify solutions to environment and development issues, using planning, analysis, modeling, and new approaches.*
- ✓ *Acquire fieldwork techniques to study, observe and prepare documents, charts, PPTs, Models etc.*
- ✓ *Understand how natural resources should be used judiciously, to protect biodiversity and maintain ecosystem.*

UNIT - 1 **L-6**

NATURAL RESOURCES : Environmental Studies- definition, scope and its importance; Need for public awareness, natural resources, forest resources and deforestation; Water resources - properties and conflicts; Mineral resources - extraction and impacts; Food resources - modern agriculture methods, fertilizer-pesticide problems, water logging and salinity; Energy resources - renewable and non-renewable energy resources, harness technology, solar energy technologies; Land resources - land degradation, soil erosion; Role of an individual in conservation of natural resources.

UNIT - 2 **L-6**

ECOSYSTEMS AND BIODIVERSITY : Ecosystem - concept, structure and functions of an ecosystem; Food chains, food webs, ecological pyramids, energy flow, energy regulation and succession; Biogeochemical cycles; Aquatic ecosystems; Biodiversity - introduction, bio-geographical classification, values of biodiversity, biodiversity at global, national and local levels, hot-spots of biodiversity, threats to biodiversity, endangered and endemic species of India and conservation of biodiversity.

UNIT - 3 **L -6**

WASTE MANAGEMENT AND GREEN TECHNOLOGY : Solid waste management - causes, effects and control measures of municipal and industrial wastes; Pollution - air, water, thermal, soil and noise pollutions; Role of an individual in prevention of pollution; Remote sensing / GIS - introduction, definitions, applications of the remote sensing; Innovative practices-objectives, innovative practices in agriculture, forest-community and bio-villages; Green technology for sustainable development, life cycle assessment and its concept.

UNIT - 4 **L -6**

SOCIAL ISSUES AND EIA : Sustainable development, water conservation, cloud seeding, rainwater harvesting methods, watershed management, global warming, acid rain, ozone layer depletion; Environmental legislation; wildlife protection act, water act, forest conservation act, air act, environmental protection act; Environmental impact assssment (EIA) - introduction, definition of EIA and EIS, scope and objectives, importance of EIA in proposed projects/industry/developmental activity.

UNIT - 5 **L-6**

ENVIRONMENTAL SANITATION : Food sanitation **-** food and drugs act, food preservations, milk sanitation, tests for milk, pasteurization of the milk; Water, air, soil and food borne diseases; Maintenance of sanitary and hygienic conditions; Role of youth in the development; Promoting activities -youth as initiators and activities; Field work/environmental visit - visit to a local area to document environmental assets river/ forest/grassland/hill/mountain; Study of local environment - common plants, insects, birds; Study of simple ecosystems - pond, river, hill slopes etc., Visit to industries/water treatment plants/effluent treatment plants.

TEXT BOOKS:

1. A. Kaushik and C.P. Kaushik, "Perspectives in Environmental Studies", 5th edition, 2016.
2. B. Joseph, "Environmental studies", 2nd edition, McGraw Hill Education, 2015.

REFERENCE BOOKS:

1. Dr. M. Chandrasekhar, "A Text book of Environmental Studies", HI-TECH publications, 2006.
2. Dr. M. Anji Reddy, "A Text book of environmental science and Technology", B S Publications, 2008.
3. Dr. K. Mukkanti, "A Text book of Environmental Studies", S.Chand and Company Ltd, 2009.
4. EHILRS and ST, "Text book of Municipal and Rural Sanitation", M.S Hill, 1998.
5. C. S. Rao, "Environmental Pollution Control Engineering", New Age International Ltd, 2001.

16BT102 BIOPRODUCTS AND BIOENTREPRENEURSHIP

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
5	45	2	12	2	5

Course Description and Objectives:

The course offers knowledge on various bio-products and their marketing. The objective of the course is to create awareness on a wide array of biologically derived products. In addition, it also encourages students to explore entrepreneurship in the arena of bioproducts.

Course Outcomes:

The student will be able to:

- gain insights on a wide range of bioproducts viz., biofuels, biomaterials, biochemicals of therapeutic and nutritional importance.
- analyse and perceive green entrepreneurship and bioproduct market.

SKILLS:

✓ *Evaluate the scope for bioentrepreneurship.*

✓ *Recycle and reuse biowaste.*

✓ *Design small scale industry setup.*

✓ *Analyze bioproducts market trend.*

UNIT - 1 **L-9, T-3**

INTRODUCTION TO BIOPRODUCTS: Definition of bioproducts; Categories of bioproducts; Importance of bioproducts; Bioproducts industry - strategies and action plans, global trends and current situation; Bioproducts used for decoration; Biofertilisers; Examples of clonal propagation of plants; Socio-economic and environmental impact of bioproducts.

UNIT - 2 **L-9, T-3**

ENERGY RELATED BIOPRODUCTS: Liquid fuels - ethanol and biodiesel; Carbon neutrality; Conversion mechanisms; Solid biomass for combustion to generate heat and power; Gaseous fuel such as biogas; Renewable energy opportunities for Indian entrepreneurs.

UNIT - 3 **L-9, T-3**

BIOMATERIALS: Bioplastics from plant oils and sugars; Biofoams and biorubber from plant oils and latex; Biocomposites manufactured from agricultural (e.g., hemp, flax, kenaf) and forestry; Biofibres.

UNIT - 4 **L-9, T-3**

BIOCHEMICALS: Industrial - basic and specific chemicals, resins, lubricants and solvents; Pharmaceuticals - examples of monoclonal therapeutic antibodies, interleukins, enzymes (therapeutic and detergent), hormones and vaccines; Antibiotics; Omega 3 fatty acids; Biocosmetics - soaps, body creams and lotions; Biorepellents - case study; Trichoderma.

UNIT - 5 **L-9, T-3**

ENTREPRENEURSHIP RELATED TO BIOPRODUCTS: Entrepreneurship ecosystem and bioeconomy; Perception and analysis of green entrepreneurship ecosystem by its stakeholders; Green entrepreneurship - case studies; Bioproducts manufacturers and suppliers in India.

TEXT BOOKS :

1. N.T. Dunford, “Food and industrial bioproducts and bioprocessing”, Wiley-Blackwell publishers, 2012.

2. J.C. Philp and K.C. Pavanan, “Perspectives- bio-based production in a bioeconomy”, Asian Biotechnology and Development Review, Vol. 15, No.2, pp 81-88, 2012.

REFERENCE BOOKS :

1. J. W. Lee, "Advanced Biofuels and Bioproducts", Springer New York, 2013.

2. C. T. Hou and J.F. Shaw, "Biocatalysis and Bioenergy", Wiley publishers, 2008.

ACTIVITIES:

- *Models on renewable energy- biomass, biofuels, biogas.*
- *Prepare vermicompost.*
- *Case studies on green entrepreneurship.*

16ME103 WORKSHOP PRACTICE

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	45	-	-	-	20	-	-

Course Description and Objectives:

This course is aimed to impart knowledge and provide hands-on experience in Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring. In addition it also provides knowledge on various manufacturing processes such as Foundary, Welding, Machine Shops and CNC Machines.

Course Outcomes:

The student will be able to :

- identify various tools connected to the trades such as Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring.
- fabrication of wooden joints and understand joining of metals.
- make metal joints and sheet metal work.
- make metal tools like knives, needles, swords, arrows, etc.

SKILLS:

- ✓ *Prepare wooden and metal furniture.*
- ✓ *Electrical wiring and power supply in residences.*
- ✓ *Make funnels, trays, locker, steel almirahs, etc.*
- ✓ *Fabrication of various agriculture tools, hooks, axes, axels, rims, etc.*
- ✓ *CNC machines and various machining operations and processes.*

EXERCISES IN THE FOLLOWING TRADES :

1. Carpentry.
2. Fitting.
3. Tin Smithy and Black Smithy.
4. House Wiring.
5. Foundry and Welding (Demonstration).
6. Machine shop and CNC (Demonstration).

Note: In each trade, the student has to perform at least two jobs.

TEXT BOOKS :

1. S.K. Hazra Choudhury, "Elements of workshop Technology", 11th edition, Media Promoters, 1997.
2. Gopal, T.V., Kumar, T., and Murali, G., "A first course on workshop practice: Theory, Practice and Work Book", Suma Publications, Chennai, 2005.
3. Venkatachalapathy, V. S., "First year Engineering Workshop Practice", Ramalinga Publications, Madurai, 1999.

ACTIVITIES:

- *To make wooden joints like Mortise and Tenon joint, T-lap Joint which are used to prepare a wooden furniture.*
- *To prepare metal joints and metal sheet products like V-Joint and trays by using mild steel flats and Galvonised iron sheets.*
- *Trials on electrical circuit connections.*

16HS202 PROBABILITY AND STATISTICS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	35	4	10	2	-

Course Description and Objectives:

This course deals with descriptive statistics, correlation and regression and their applications, probability, theoretical distributions and testing of hypothesis. The objective of this course is to enable the student to understand and apply statistical techniques, curve fitting, correlation and regression, probability and also to make the student familiar with discrete, continuous distributions and testing of hypothesis.

Course Outcomes:

The student will be able to:

- distinguish between quantitative and categorical data and represent the data in graphical and tabular forms.
- calculate and interpret measures for the centre and spread of a data set.
- decide how and when to use the normal model.
- calculate and interpret correlation coefficient and regression lines.
- understand the rules of probability and apply them.
- compute probabilities using theoritical distributions.
- test hypothesis for population parameters.

UNIT - 1 **L-9, T-3**

STATISTICS: Basic Definitions, Frequencies, Graphical representation, Histogram, Ogive curves, Measures of central tendency, Arithmetic mean, Median, Mode, Mean deviation, Standard deviation, Symmetry and Skewness, Karl Pearson's Coefficient of skewness.

UNIT - 2 **L-9, T-3**

CURVE FITTING, CORRELATION & REGRESSION : Least squares method, Curve fitting (straight line and parabola only). Covariance, Correlation, Types, Pearson's coefficient of correlation, Rank correlation, Spearman's rank correlation. Regression, Regression lines.

UNIT - 3 **L-8, T-3**

PROBABILITY : Introduction, Definition (Classical and Axiomatic approach), Addition theorem, Conditional probability, Multiplication theorem, Total probability, Bayes theorem.

UNIT - 4 **L-8, T-3**

DISTRIBUTIONS: Random variables, Discrete and Continuous variables, Introduction to Distributions.

BINOMIAL DISTRIBUTION : Definition, Mean and Standard deviation, Recurrence relation, Applications, Fitting of binomial distribution.

POISSON DISTRIBUTION : Definition, Mean and Standard deviation, Recurrence relation, Poisson Distribution is an approximation of Binomial distribution, Applications, Fitting of Poisson distribution.

NORMAL DISTRIBUTION : Definition, Normal curve, Mean and Standard deviation, Median, Mode, Normal Distribution applications.

UNIT - 5 **L-12, T-3**

SAMPLING METHODS : Population and Sampling, Parameters and Statistics, Types of sampling. Test of hypothesis and test of significance: Null hypothesis, Errors, Level of significance, Confidence Limits, Testing large samples, Sample distribution of proportion, T-distribution for small sample, difference between means of small sample, Chi square test for goodness of fit, Chi square test for test of independence.

TEXT BOOKS:

1. Miller and Freund, "Probability and Statistics for engineers", 8th edition, Pearson publishers, 2013.
2. H. K. Dass and Er. Rajanish Verma, "Higher Engineering Mathematics", S. Chand & Co., Third edition, 2014.

REFERENCE BOOK:

1. *S.C. Gupta* and *V.K. Kapoor*, "Fundamentals of Mathematical Statistics", Sultan Chand & Co., New Delhi, 2005.

16MS201 MANAGEMENT SCIENCE

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	20	5	5	-	-

Course Description and Objectives:

This course offers the framework for improving managerial skills and leadership qualities. The objective of the course is to provide skills related to making decisions, organization structure, production operations, marketing, human resource management, product management and other management strategies.

Course Outcomes:

The student will be able to :

- understand the nature and importance of managerial skills.
- identify the significance of Operations Management.
- carry out production operations in an effective manner through work study, time study etc.
- understand the current develoments in market variations, customer requirements and competitions stagegies.
- plan and control the HR function effectively.

SKILLS :

✓ *Improve productivity and marketing through production, sales and time management techniques.*

✓ *Create better ambience in the shop floor using better interpersonal relationship.*

✓ *Conduct / organise meetings, seminars and conferences in a professional manner.*

✓ *Effective managment of human resources.*

ACTIVITIES:

- *Identify various operational functions of management using case studies.*
- *Analyze and improve marketing stategies.*
- *Estimate human resources requirement and understand the interpersonal relationships in industries.*

UNIT - 1 **L-9**

INTRODUCTION TO MANAGEMENT: Concepts of Management and organization; nature, importance and Functions of Management; Systems approach to Management; Taylor's Scientific Management Theory, Fayol's Principles of Management, Mayo's Hawthorne Experiments, Maslow's Theory of Human Needs, Douglas McGregor's Theory X and Theory Y, Herzberg's Two-Factor Theory of Motivation, Leadership Styles, Social responsibilities of Management.

UNIT - 2 **L-9**

OPERATIONS MANAGEMENT: Principles and Types of Plant Layout; Methods of production (Job, Batch and Mass Production), Work Study - Basic procedure involved in Method Study and Work Measurement

UNIT - 3 **L-9**

MATERIALS MANAGEMENT AND STATISTICAL QUALITY CONTROL: Objectives, Need for Inventory control, EOQ, ABC Analysis, Purchase Procedure, Stores Management and Stores Records; **Statistical Quality Control**: control charts for variables and attributes (simple Problems), Acceptance Sampling

UNIT - 4 **L-9**

HUMAN RESOURCES MANAGEMENT (HRM): Concepts of HRM, Basic functions of HR Manager; Manpower planning, Recruitment, Selection, Training and Development, Placement, Wage and Salary Administration, Promotion, Transfer, Separation, Performance Appraisal, Grievance Handling and Welfare Administration, Job Evaluation and Merit Rating.

UNIT - 5 **L-9**

MARKETING MANAGEMENT: Evolution of Marketing, Functions of Marketing Selling Vs Marketing; 4 P's of Marketing – Product Mix, Product Life Cycle, Place Mix – Channels of Distribution, Price Mix – Pricing Methods, Promotion Mix, Tools of Promotions.

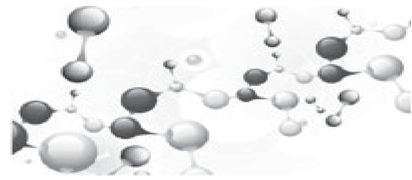
TEXT BOOKS :

1. P. Vijay Kumar, N. Appa Rao and A. Chnalill, "Introduction to Management Science" Cengage Learning India, 2012.
2. Stoner, Freeman and Gilbert, "*Management*", 6th edition, Pearson Education, New Delhi, 2004.

REFERENCE BOOKS :

1. K. Philip and K. Kevin. Lane, "Marketing Mangement" 12th edition, PHI, 2005.
2. Koontz and Weihrich, "Essentials of Management", 6th edition, TMH, 2005.

16BT201 BIOCHEMISTRY



Source:
www.medipharmlab.com/

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	30	5	50	-	8	2	2

Course Description and Objectives:

This course provides various chemical processes associated with living cell machinery. In addition, it offers a clear-cut idea about various molecular mechanisms, metabolic pathways and biochemical processes regulating the production of energy for the functioning of cells. The objective of this course is to familiarize students on the complex structures of biomolecules, their synthesis, interaction and metabolism.

Course Outcomes:

The student will be able to

- understand the structures and functions of biological molecules and interactions between them.
- gain sufficient insights into redox biochemistry.
- acquire adequate knowledge on various pathways in intermediary metabolism and bioenergetics.
- judge whether a proposed or hypothetical reaction is consistent with the general framework of catabolic and anabolic metabolism.
- assess how common foodsstuffs are turned into metabolic energy and predict the energy levels of different classes of biomolecules.

SKILLS:

✓ *Identify biomolecules by colorimetric and biochemical assays.*

✓ *Quantify macromolecules using UV-VIS Spectrophotometer.*

✓ *Proficiency in paper, thin layer and gel chromatographic techniques.*

✓ *Operation of HPLC.*

ACTIVITIES:

- *Analyze bio-molecules in food samples.*
- *Estimate macromolecules in biological fluids.*
- *Model exercises on building structures of macromolecules.*

UNIT - 1 **L-9**

CARBOHYDRATES: Structure and properties of mono-, di-, oligo- and polysaccharides, complex carbohydrates; Confirmation of pyranose and furanose ring, glycosidic bond; Structure and function of glycogen, starch, dextran, cellulose, glycoproteins, glycosaminoglycans and lectins.

UNIT - 2 **L-9**

BIOENERGETICS AND METABOLISM OF CARBOHYDRATE: Aerobic and anaerobic respiration-glycolysis, glucogenesis, glycogenolysis and gluconeogenesis; Entner–Doudoroff (ED) pathway; Pentose phosphate shunt and TCA cycle.

UNIT - 3 **L-9**

METABOLISM OF AMINO ACIDS: Amino acids - classifications, physico-chemical properties; Protein structure, folding and function; Nitrogen cycle; Nitrogen balance; Reductive amination; Transamination and urea cycle; Synthesis of amino acids - glutamate pathway, serine pathway and shikimate pathway.

UNIT - 4 **L-9**

LIPIDS AND THEIR METABOLISM: Classification, structure and roles of fatty acids; Synthesis and breakdown of fatty acid; Synthesis and metabolism of triglycerides; Cholesterol structure and function; Lipoproteins - classification and function.

UNIT - 5 **L-9**

NUCLEIC ACIDS AND INTERMEDIARY METABOLISM: Structure and properties of purines, pyrimidines, nucleosides and nucleotides; Biosynthesis and degradation of nucleic acids; Interconnection of pathways and metabolic regulation.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Preparation of buffers and pH measurement.
2. Qualitative and quantitative tests for carbohydrates by 3,5-dinitro salicylic acid (DNS) method.
3. Qualitative and quantitative tests for amino acids.
4. Protein estimation by Biuret / Lowry / Bradford methods.
5. Separation of different macromolecules by paper and thin layer chromatography.
6. Extraction of lipids through solvents.
7. Analysis of cholesterol by Zak method.
8. Estimation of RNA by Orcinol methods.
9. Separation of proteins by electrophoresis.

TEXT BOOKS:

1. A.L. Lehninger, O.L. Nelson and M.M. Cox , "Principles of Biochemistry" 3rd edition, CBS Publications, 2005.

2. J.L. Jain , "Fundamentals of Biochemistry ", 7th edition, S. Chand Publishers, 2009.

16BT202 CELL BIOLOGY

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	50	-	12	2	3

Course Description and objectives:

This course provides an understanding of various cell organelles, their functions and inter-organellar interactions. The objective of the course is to impart knowledge on complexity involved in cell signaling and cell cycle. In addition, laboratory experiments are designed to familiarize students with the functioning of cell and its organelles.

Course Outcomes:

The student will be able to

- understand the basic structure of cell and their organelles.
- acquire knowledge on cell cycle and its regulation.
- possess in-depth knowledge on *in-vitro* fertilization.
- understand embryo and organ formation.

SKILLS:

✓ *Differentiate various blood cells for hematological profile.*

✓ *Identify various stages of cell division and differentiation.*

✓ *Handle fluorescence microscope.*

Unit - 1 **L-9**

STRUCTURE OF CELLS: Structure of prokaryotic and eukaryotic cells; Overview of organelles-mitochondria, chloroplasts, endoplasmic reticulum, golgi complex, nucleus; Cytoskeletal proteins - contractile proteins - actin, myosin and nebulin.

Unit - 2 **L-9**

TRANSPORT ACROSS CELL MEMBRANES: Organization of plasma membrane; Passive and active transport; Na-K pump; Ca^{2+} ATPase pump; Lysosomal and vacuolar membrane; ATP dependent proton pumps - cotransport, symport, anti-port, ion-gated and ligand gated channels; Endocytosis and exocytosis.

Unit - 3 **L-9**

REGULATION OF CELL CYCLE AND CANCER: Cell division- mitosis and meiosis; Cell cycle and regulation; Cancer- types, development and causes; Mutagenesis - tumor suppressor genes and oncogenes.

Unit - 4 **L-9**

CELL SIGNALING: Intracellular signaling; Types of signal receptors; Signal transduction by hormones - steroid/peptide hormones; secondary messengers - cAMP, cGMP, protein kinases; G Proteins - receptor mediated tyrosine kinases.

UNIT - 5 **L-9**

GAMETE BIOLOGY: Heterogamy in eukaryotes; Leydig cells- morphology and differentiation; Spermatogenesis; Semen formation; Sperm bank; Artificial insemination; *in vitro* fertilization; Stages of development - zygote, blastula, gastrula and neurula.

LABORATORY EXPERIMENTS

List of Experiments Total Hours-30

1. Media Preparation for *in vitro* animal cell culture and propagation.
2. Microscopic analysis of cells and cell organelles.
3. *In vitro* primary cell culture and maintenance.
4. Quantitative assessment of cell attachment to different surfaces.
5. Trypsinization of cells from cell culture plates.
6. Cell counting by Haemocytometer.
7. Passaging of cells for further culturing of cells *in vitro*.
8. Differential cell count by staining to differentiate between cell types.
9. Smear preparation for microscopy and immunohistochemistry.

TEXT BOOKS :

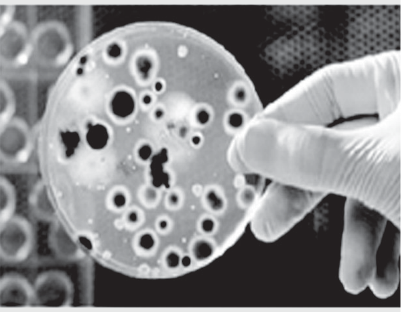
1. P. S. Verma and V.K. Agarwal, "Cell Biology, Genetics and Molecular Biology", S. Chand and company, New Delhi, 2000.
2. E.D.P. De Robertis and E.M.F. De Robertis, "Cell and Molecular Biology", 8th edition, B.I. Waverly Pvt. Ltd., New Delhi, 2006.
3. G.M. Cooper, “The Cell-A Molecular Approach", 3rd edition, Sinauer Publications, 2004.

REFERENCE BOOKS :

1. G. Karp, "Cell and Molecular Biology", 5th edition, Wiley Publishers, 2008.

ACTIVITIES:

- *Demonstrate various stages of chick embryo development.*
- *Culture different cell lines.*
- *Assess cell viability.*
- *Identify individual cell organelles by staining.*



Source: www.medipharmlab.com/

16BT203 MICROBIOLOGY

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	50	-	8	3	3

Course Description and Objectives:

This course provides the classification of microorganisms, culturing methods and their control. The objective of this course is to impart knowledge on scope and relevance of microbes and microscopic examination. In addition, the course also imparts knowledge on microbial genetics and genetically modified microbes suitable for industries.

Course Outcomes:

The student will be able to:

- maintain sterile conditions in microbiology laboratory.
- understand the principles of microscopy.
- understand the scope and historical developments in the field of microbiology.
- identify and classify the microorganisms based on various attributes.
- cultivate pure cultures using specific as well as enrichment media.

SKILLS:

✓ *Handle different microscopes.*

✓ *Isolate microbes.*

✓ *Differentiate between microbial species.*

✓ *Aseptic maintenance of lab and hood.*

✓ *Maintain stock cultures.*

UNIT - 1 **L-9**

INTRODUCTION TO MICROBIOLOGY: Discovery of microorganisms; Theory of spontaneous generation, Germ theory of diseases; Major contribution and events in the field of Microbiology; Scope and relevance of microbiology; Microscopy-types; Fixation of microorganisms; Principle dyes, principles of different staining techniques- simple staining, differential staining, spore staining, flagellar staining, acid fast and capsular staining.

UNIT - 2 **L-9**

MAJOR GROUPS OF MICROORGANISMS: Diversity classification proposed by Woese et al; Three Domains of life; Classification systems- phylogenetic, phenetic, genetic; Taxonomic ranks; Major characteristics used in taxonomy; Molecular approaches to microbial taxonomy.

UNIT - 3 **L-9**

NUTRITION FOR MICROORGANISMS: Nutritional classes of microbes, Macro and micronutrients, their sources and physiological functions of nutrients, growth factors and their functions in metabolism; Aerobic and anaerobic metabolism; Growth curve and kinetics.

CULTIVATION OF MICROORGANISMS: Culture media-synthetic and complex media; Solidifying agents; Types of media - selective, differential and enrichment media; Pure culture methods - spread plate, pour plate and streak plate; Special techniques for cultivation of anaerobes.

UNIT - 4 **L-9**

MICROBIAL DISEASES AND HOST PATHOGEN INTERACTION: Classification of infectious diseases; Emerging infectious diseases; Molecular basis of pathogenicity and identification methods; Human diseases caused by viruses, bacteria and fungi.

UNIT - 5 **L-9**

STERILIZATION AND CONTROL OF MICROORGANISMS: Sterilization processes- autoclaves, UV radiations, filter sterilization, disinfection; Physical agents - moist and dry heat; Chemical agents - characteristics and mode of action of antimicrobial agents; Classes of disinfectants - phenol, phenolics, alcohol, halogens (chlorine, chloramines, bromine, iodine, tinctures of iodine, iodophores), surfactants (soaps and detergents), alkylating agents (formaldehyde, glutaraldehyde, 3-propiolactone and ethylene oxide), heavy metals (mercury, silver and copper containing compounds); Evaluation of effectiveness of antimicrobial agents.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Sterilization techniques in microbiology: wet method, dry method and filter sterilization methods.
2. Study of Microscopes- dark field, bright field, phase contrast and fluorescence microscopy.
3. Microscopical identification of bacterial cells in permanent fixed slides.
4. Preparation of nutrient broth and agar for culturing *E. coli*.
5. Different inoculation methods of microorganisms in culture media.
6. Isolation of pure culture by streak plate and pour plate technique.
7. Gram staining of bacteria and observation under microscope.
8. Hanging drop method to observe bacterial motility.
9. Biochemical tests.

ACTIVITIES:

- *Isolate microbes from different sources – air, soil and water.*
- *Identify pathogens from local hospitals and dairy farms.*
- *Purify different strains of bacteria and fungi.*
- Carryout *sterilization processes.*

TEXT BOOKS:

3. M.J.Pelczar, E.C.S.Chan and N.R. Krieg, "Microbiology", 5th edition, Tata McGraw Hill, 2006.

16CS254 SCRIPTING LANGUAGES

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

CS	WA/RA	SSH	SA	S	BS
5	5	40	8	5	2

Course Description and Objective:

This course offers the concepts of scprting language Python. The objective of this course is to enable the students to understand design automation and testing tools using scrpting languages.

Course Outcomes:

The student will be able to:

- develop tools using Python.
- design of algorithms to retrieve information across various domains.
- implement advanced network applications.
- develop text processing and GUI applications.

Skills:

✓ *Design and develop applications for data processing, automation and testing in various domains such as web mining and semantic web.*

✓ *Develop and test web applications.*

✓ *Develop tools for network simulation.*

✓ *Create test scripts for automated testing of standalone and web applications.*

ACTIVITIES :

- *Implementation of data types such as scalars, arrays, lists using Python.*
- *Implementation of simple matching expressions using Python.*
- *Develop functions using Python.*
- *Finding the similarity of text documents.*

UNIT - 1 **L-9**

INTRODUCTION TO PROCEDURAL PROGRAMMING: Running python programs, data types, object references, collection data types, logical operations, control flow statements, arithmetic operators, input/output, creating and calling functions; Data types- identifiers and keywords, integral types, floating-point types and strings; Collection data types- sequence types, set types, mapping types, iterating and copying collections.

UNIT - 2 **L-8**

CONTROL STRUCTURES AND FUNCTIONS: Control structures, exception handling, custom functions; Modules- modules and packages, overview of python's standard library, string handling, command-line programming, mathematics and numbers, times and dates, algorithms and collection data types, file formats, encodings, and data persistence, file, directory and process handling; Networking and internet programming; XML.

UNIT - 3 **L-9**

OBJECT-ORIENTED PROGRAMMING: The object-oriented approach, custom classes, custom collection classes; File handling- writing and reading binary data, writing and parsing text files, writing and parsing XML files and random access binary files.

UNIT - 4 **L-10**

PROCESSES AND THREADING: Using the multiprocessing module, using the threading module; Networking- creating a TCP client and creating a TCP server; Database Programming - DBM databases and SQL databases.

UNIT - 5 **L-9**

REGULAR EXPRESSIONS: Python's regular expression language, characters and character classes, quantifiers, grouping and capturing, assertions and flags; The regular expression module. Introduction to GUI Programming - dialog-style programs, main-window-style programs, creating a main window and creating a custom dialog.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hrs:30

1. Program to print given string on the screen.
2. Accept a user name as string and wish the user like "Hello Vignan".
3. Read two integers and perform all arithmetic operations on those two numbers.
4. Develop a program to accept three numbers from user and find biggest, smallest and average of the same.
5. Print numbers from 1 to 100 using all types of loops.
6. Develop a function to display "Hello <<USER>>".
7. Compute factorial of a number.
8. Find the sum of first N numbers.
9. Compute sum of first N even numbers.
10. Find sum of first N odd numbers.

11. Print Fibonacci series up to a number.
12. Calculate square root of a number.
13. Handle divide by zero exception.
14. Demonstrate sequence type.
15. Demonstrate set type.
16. Create a dictionary of student data and search for a student.
17. Create a class called student and perform operations such as display, calculate percentage, add, delete and modify student data.
18. Find number of occurrences of distinct words from a text file.
19. Store student data such as Regd No., Name, Dept, Percentage, DOB in an XML file.
20. Program to create two threads.
21. Implement a program to connect to vignanuniversity.org and display number of bytes received.
22. Insert student data in a database.
23. Find all mobile numbers in a text file and store them in other file.

20	45	1	10	2	2

Course Description and Objectives:

The course introduces basic principles of Mendelian laws of Genetics and organization of genetic material. It also describes fine structure and function of chromosomes. The objective of this course is to provide insight into Laws of inheritance, chromosomes, genetic aberrations, genetic linkage and extra-chromosomal inheritance.

Course outcomes:

The student will be able to:

- understand the genetic basis of heredity with appropriate examples.
- gain knowledge on organization of genetic material, chromosomes and their functions.
- know the basics of genetic linkage and genetic diseases.

SKILLS:

✓ *Solve genetics problems related to Mendelian Laws of inheritance.*

✓ *Disease mapping by pedigree.*

✓ *Karyotype human chromosome.*

✓ *Map chromosome.*

UNIT - 1 **L-9, T-3**

PHYSICAL BASIS OF HEREDITY: Historical perspectives of genetics; Mendelian laws/Basic laws of inheritance- monohybrid, dihybrid and trihybrid cross; Modification of Mendel's ratios due to gene interactions; Multiple alleles and lethality; Multiple factors of inheritance; The concept of linkage, crossing over and recombination; Two point, three-point test crosses and gene mapping; Probability in Mendelian inheritance.

UNIT - 2 **L-9, T-3**

GENETIC MATERIAL AND ITS ORGANIZATION: Identification of the genetic material; Classical experiments- Hershey-Chase, Avery–MacLeod–McCarty and Meselson-Stahl. Packing and organization of genetic material in prokaryotes and eukaryotes; Chromosome morphology, classification and karyotyping; Special chromosomes.

UNIT - 3 **L-9, T-3**

BACTERIAL GENETICS AND EXTRA CHROMOSOMAL INHERITANCE: Conjugation, transformation and transduction; Phages and their life cycles; Retroviruses; Introduction to extra chromosomal inheritance with examples; Petite phenotypes in yeast; Uniparental inheritance in algae.

UNIT - 4 **L-9, T-3**

GENE STRUCTURE AND MUTATIONS: Spontaneous and induced mutations; Selection of mutants- Ames test; Chromosomal aberrations; Fine structure of genes in prokaryotes and eukaryotes; Genetic control of development in Drosophila.

UNIT - 5 **L-9, T-3**

CONCEPTS OF HUMAN GENETICS (SEX DETERMINATION, LINKAGE AND DOMINANCE): Introduction - population genetics, eugenics and euthenics; Mechanisms of sex determination and differentiation; Sex influenced dominance; Sex linked inheritance and sex limited gene expression; Molecular basis of genetic diseases and applications.

TEXT BOOKS:

1. P.K. Gupta, "Genetics", 3rd edition, Rastogi Publications, 2005.
2. E. J. Gardner, M.J. Simmons and D. P. Snustad, "Principles of Genetics", 8th edition, Wiley India, 2007.

REFERENCE BOOKS:

1. M.W. Strickberger, "Genetics", 3rd edition, Prentice Hall of India Publications, 2006.
2. W. H. Elliott and D.C. Ellioit, "Biochemistry and Molecular Biology", 3rd edition, Oxford University Press, 2007.

ACTIVITIES:

- *Examine Mendelian Laws using pea plant by applying Punnett squares.*
- *Design Ames test to understand mutation.*
- *Solve the crossover problems using Drosophila as an example.*
- *Conduct conjugation experiment using E. coli model.*

16BT208 MOLECULAR BIOLOGY

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
6	50	-	8	2	-

Course Description and Objectives:

This course describes the structure, synthesis and processing of nucleic acids and protein synthesis in prokaryotes and eukaryotes. The objective of this course is to impart the concepts of genetic materials, central dogma, mutations and DNA repair.

Course Outcome:

The student will be able to

- learn the structure of genetic materials.
- understand the concepts of central dogma of life.
- understand biochemical synthesis and molecular processes that occur during cell growth.
- acquire concepts of genetic code.

SKILLS:

✓ *Determining purine-pyrimidine complementation.*

✓ *Handling of micro-pipette.*

✓ *Setting up chemical reactions in micro-volumes.*

✓ *Handling reagents, enzymes and biochemicals related to molecular biology.*

UNIT - 1 **L-9**

STRUCTURE OF DNA AND RNA: Discovery-structure of DNA; B, A and Z models; Denaturation and melting curves; m-RNA, r-RNA, t-RNA structures.

UNIT - 2 **L-9**

DNA REPLICATION: Models of DNA replication: semi-conservative model, mitochondrial (D-loop), viral DNA (Rolling circle); Single stranded- DNA phages (M13, phi-174); Mechanism of DNA replication in *E.coli* (bi- directional); Inhibitors of DNA replication; Enzymes involved in replication; Eukaryotic telomeres.

UNIT - 3 **L-9**

RNA BIOSYNTHESIS AND POST TRANSCRIPTIONAL PROCESSING: Transcription apparatus; Mechanism of transcription in prokaryotes and eukaryotes; RNA polymerases and proteins involved in transcription; Inhibitors of transcription; Post transcriptional processing of mRNA.

UNIT - 4 **L-9**

PROTEIN BIOSYNTHESIS IN PROKARYOTES AND EUKARYOTES: The genetic code and Wobble Hypothesis; Protein synthesis in prokaryotes and eukaryotes; Differences between prokaryotic and eukaryotic protein synthesis; Post translation modifications; Inhibitors of protein synthesis.

UNIT - 5 **L-9**

MUTAGENESIS: Types of mutagens and their actions; Types of mutations- spontaneous, induced and lethal; Characteristics of mutations and applications; Site- directed mutagenesis and reverse genetics; DNA damage and repair mechanisms; Nucleotide excision repair mechanisms; Mismatch repair mechanism and base excision repair mechanism.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total Hours-30

1. Isolation of genomic DNA from plants.
2. Isolation of genomic DNA from animals.
3. Isolation of genomic DNA from bacteria.
4. Quantification of DNA by UV Spectrophotometer.
5. Isolation of RNA.
6. Quantification of RNA by UV Spectrophotometer.
7. Agarose gel electrophoresis to visualize and quantify DNA isolated from bacteria, plants or animals.
8. SDS-PAGE technique for separation of proteins.
9. Staining of PAGE gels with Coomassie brilliant blue.
10. Staining of PAGE gels with silver nitrate.

ACTIVITIES:

- *model the double-helix of DNA using ball and stick kit.*
- *Identify complements, palindromes, loops and bends.*
- *Predict DNA complexity by gel electrophoresis.*
- *Amplify gene using PCR.*

BT, VU, Dirisala etal., (2015)
Mediators of Inflammation,
Article ID 619480.

Course Description and Objectives:

The course offers insights on concepts related to biological databases. The objective of this course is to provide knowledge on design, development and implementation of biological database systems.

Course Outcomes:

The student will be able to:

- understand the utility of database systems.
- perform various operations in structural databases.
- understand the role of various enzymes in metabolic pathways.

SKILLS:

✓ *Design model ontologies for biomedical data dependencies.*

✓ *Design systems biology databases.*

✓ *Design protein classification databases.*

ACTIVITIES:

- *Retrieve file formats of various public databases such as Genbank and PDB.*
- *Perform biomolecular sequence analysis.*
- *Perform biomolecular structure analysis.*

UNIT - 1 **L-9**

INTRODUCTION TO BIOINFORMATICS: Basic concepts of cell, gene, genome and genetic code; Central dogma; Nucleic acids and proteins; Biological sequence data; Need for biological databases.

UNIT - 2 **L-9**

SEQUENCE DATABASES: Nucleotide databases - Genbank, DDBJ, EMBL, NCBI; Protein sequence databases- PIR, SWISSPROT, TrEMBL.

UNIT - 3 **L-9**

STRUCTURAL DATABASES: Secondary,tertiary and quarternary structures of proteins; Ramachandran plot; Databases - PDB, SCOP, CATH, SSEP, CADB, THGS, SMS, Pfam and GDB.

UNIT - 4 **L-9**

PATHWAY DATABASES: Role of enzymes in biochemical pathways; Enzyme databases - MEROPS, BRENDA and EXPASY; Pathway databases - CAZy and KEGG; Disease databases and literature databases - EXPLORE ENZ.

UNIT - 5 **L-9**

SPECIAL TOPICS IN BIOINFORMATICS: New directions of bioinformatics research; essential prerequisites; Scope of bioinformatics; Application of bioinformatics in pharmacy and IT industries.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. GenBank- Retrieval of DNA, RNA and protein sequences.
2. NCBI ENTREZ- Searching research articles through PubMed.
3. EMBL- Retrieval of DNA, RNA and protein sequences.
4. DDBJ- Retrieval of macromolecular sequences for analysis.
5. SWISSPROT- Searching and retrieval of protein sequences in different formats for analysis by various softwares.
6. PIR- Using of protein information resource to support genomic and proteomic research activities.
7. TrEMBL- A supplement of SWISS-PROT for analysing and evaluating protein sequences.
8. PDB- Retreival of protein sequences for sequence analysis.
9. SCOP- Analyze proteins having structural similarities for checking the common evolutionary origin.
10. CATH- Classification of protein structures based based on sequences downloaded from PDB.
11. Pfam- Multiple sequence alignment of proteins in to clans and families.
12. PROSITE and BLOCKS- Database of protein families and domains.
13. UCSC Genome Browser- Using UCSC on-line genome browser access to genome sequence data from a variety of vertebrate and invertebrate species integrated with a large collection of aligned annotations.

16BI202 MOLECULAR EVOLUTION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	45	-	8	2	5

Course Description and Objectives:

This course imparts knowledge on species concepts and causative features of evolution. The objective of this course is to provide insights into gene evolution, exon shuffling and intron hypothesis. In addition, software programs used in the construction of phylogentic trees are also dealt with.

Course Outcomes:

The student will be able to:

- explain evolutionary concepts.
- infer the cladograms obtained through software packages.
- correlate and extend the principles to all groups of living organisms.
- create relations among the chosen species.
- demonstrate the cause for epidemics.
- evaluate the genetic similarity and distances among the test organisms.

SKILLS:

✓ *Analyze molecular clock in the estimation of species diversity.*

✓ *Construct phylogenetic trees using software tools: Mr. Bayes and Paup.*

✓ *Utilize online software tools to convert files such as FASTA, Phylip and NEXUS.*

UNIT - 1 **L-9**

SCIENCE OF TAXONOMY: Contribution of systematics to biology; Systematics as the science of organic diversity; The history of taxonomy; Systematics as a profession and the future of systematics; Description of terms - taxonomy, classification and systematics; Taxonomic characters; Biological species concept - reproductive isolating mechanisms; Modes of speciation - allopatric, sympatric, parapatric and cryptic.

UNIT - 2 **L-9**

MOLECULAR EVOLUTION: Gene evolution; Evolution of gene families; Exon shuffling; Intron hypothesis; Concerted evolution; Neutrality hypothesis; Molecular clock hypothesis; Applications of molecular trees; Molecular basis of macroevolution.

UNIT - 3 **L-9**

PHYLOGENETIC TREES: Construction of phylogenetic tree; Terms used in representing a phylogenetic tree; Rooted trees and unrooted trees; Rooting phylogenetic trees; Tree confidence-bootstrapping and estimating the reliability of phylogenetic trees; Types of trees; Cladogram; Phylogram; Dendrogram; Gene tree vs. species tree; Ultrametric trees; Perfect phylogeny.

UNIT - 4 **L-9**

FILE FORMATS AND DISTANCE VS. CHARACTER-BASED METHODS: File Formats - FASTA , Clustal, Nexus, Phylip, GCG/MSF, NBRF/PIR and interconverting formats; Distance vs. character-based methods; Character-based methods - Parsimony, maximum likelihood and Bayesian analysis; Distance methods - UPGMA and Neighborhood joining.

UNIT - 5 **L-9**

CONSTRUCTION OF PHYLOGENETIC TREES : Query sequence (DNA/Protein); Sequence similarity search; Methods of multiple sequence alignments; BLAST Analysis; Construction of a dendrogram using online ClustalW2 program; Creating parsimony tree using PAUP; Creating maximum likelihood DNA trees using PAUP; Using MrBayes to create Bayesian DNA trees.

ACTIVITIES:

- *Deduce evolutionary relationships using phylogenetic trees.*
- *Construct rooted and unrooted trees.*
- *Construct dendrogram.*
- *Perform multiple sequence alignment using software tools.*

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Applications of trees (UPGMA; NJ plots; PAUP and MEGA).
2. History and philosophy of phylogenetics, concept of homology, choice of characters.
3. Sequences as phylogenetic characters.
4. Sequence alignment, datamatrices.
5. Introduction to parsimony, rooting trees.
6. Parsimony methods, weighting characters.
7. Assessing support; Introduction to maximum likelihood.
8. Maximum likelihood and models of sequence evolution.
9. Maximum likelihood and models of sequence evolution.
10. Distance-based phylogenetic methods; Comparison of tree reconstruction methods.
11. Species concepts; Gene trees versus species trees
12. Study of Phylogeography with reference to animal species (Eg. Snails; Butterflies etc.)

TEXT BOOKS:

1. E. W. Mayr, P. D. Ashlock, "Principles of systematic Zoology", McGraw Hill,1991.
2. D. Graur and W.Li, "Fundamentals of Molecular Evolution", 2nd edition, Sinauer Associates Inc. 2000.
3. M.Nei and S. Kumar, "Molecular evolution and phylogenetics", Oxford University press, 2000.

16EL102 SOFT SKILLS LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The Soft Skills Laboratory course is aimed at training undergraduate students on employability skills. Designed to impart work related skills, the course will enable trainees to develop interpersonal communication, leadership, preparing resumé, group discussion and interview skills. It will give them the required competence and confidence to handle professional tasks.

Course Outcomes:

The student will be able to :

- formulate mathematical models of physical systems and represent them in block diagrams and signal flow graphs equip with requisite professional and inter-personal skills.
- think critically on issues for informed decision making and know how to communicate effectively through choice of appropriate language and speech, while dealing with others at the workplace.
- identify and introspect on individual strengths and weaknesses.
- improve levels of self-awareness and self-worth for greater efficacy at workplace.

SKILLS:

✓ *Communicate and understand the difference between soft skills and hard skills.*

✓ *Professionalism and employability skills.*

✓ *Plan career by drawing their SWOT, setting the goal, learn the importance of time and stress management.*

✓ *Vocabulary, situational english, group discussion, reading comprehension and listening comprehension which are essential for all competitive examinations.*

✓ *Prepare resumé and learn how to face interview.*

✓ *Gender sensitive language, good manners, emotional intelligence and essential skills.*

ACTIVITIES:

- *Formal and informal communication.*
- *SWOT analysis.*
- *Stephen covey Time Management matrix.*
- *Stress Management techniques.*
- *Vocabulary flash cards.*
- *Situational Dialogues.*
- *Group Discussion.*
- *Resume preparation.*
- *Mock Interview.*
- *Reading comprehension activities.*
- *Listening comprehension Activity by watching the American accent video.*
- *Emotional intelligence, etiquette quiz.*

UNIT - 1 **P-8**

A) COMMUNICATION: Need for effective communication - the process of communication, levels of communication, flow of communication, choice of diction and style with reference to setting (formal, semi-formal or informal); communication networks, barriers to communication, miscommunication, noise and ways to overcome the barriers.

B) SOFT SKILLS: Difference between soft and hard skills, need for soft skills, professionalism, employability skills.

C) CAREER PLANNING:

Job vs. career, goal setting, SWOT analysis, planning and prioritization, four quadrant time management system, self-management, stress-management.

ACTIVITY: Johari Window for SWOT analysis; Setting a SMART goal using the provided grid; Writing a statement of purpose (SOP).

UNIT - 2 **P-8**

A) VOCABULARY BUILDING: Word etymology, roots, prefixes & suffixes, synonyms and antonyms, collocations, one-word substitutes, analogies, idioms and phrases, contextual guessing of unfamiliar words, task-oriented learning (50 words).

ACTIVITY: Making a flash card (one per day by each student) – vocabulary exercises with hand-outs; Vocabulary quiz (evaluation will be a combination of the 50 words provided by the instructor and the flash cards made by the student (one per day).

B) FUNCTIONAL ENGLISH: Situational dialogues, role plays (including small talk), self introduction, opening and closing a telephonic conversation, making an appointment, making a query, offering/ passing on information, communicating with superiors, expressing agreement/objection, opening bank account (combination of prepared and impromptu situations given to each student).

C) GROUP DISCUSSION: Articulation and flow of oral presentation, dynamics of group discussion, intervention, summarizing and conclusion, voice modulation, content generation, key word approach (KWA), social, political, economic, legal and technical approach (SPELT), view point of affected part (VAP), language relevance, fluency and coherence.

ACTIVITY: Viewing a recorded video of GD and Mock sessions on different types of GD topics- controversial, knowledge, case study (including topics on current affairs).

UNIT - 3 **P-4**

A) RESUME-WRITING: Structure and presentation, defining career objective, projecting one's strengths and skill-sets, summarizing, formats and styles and covering letter.

ACTIVITY: Appraising some samples of good and bad resumes, preparing the resume, writing an effective covering letter.

B) FACING INTERVIEWS: Interview process, understanding employer expectations, pre-interview planning, opening strategies, impressive self-introduction, answering strategies, other critical aspects such as body language, grooming, other types of interviews such as stress-based interviews, tele- interviews, video interviews, frequently asked questions (FAQs) including behavioural and HR questions and the aspect looked at by corporate during interviews.

ACTIVITY: Writing responses and practicing through role plays and mock interviews on the FAQs including feedback.

UNIT - 4 **P-4**

A) READING COMPREHENSION: Reading as a skill, techniques for speed reading, understanding the tone, skimming and scanning, appreciating stylistics, impediments for speed reading, eye fixation, sub-vocalization, critical reading, reading based on purpose, reading for information, reading for inference.

ACTIVITY: Reading comprehension exercises with texts drawn from diverse subject areas (handouts); Newspaper activity with students divided into 4 groups; Each group looks at critical component of communication such as listening, speaking, reading and writing enabling them to be better communicators as well as be more aware about the current affairs, which help in group discussion.

B) LISTENING COMPREHENSION: Listening as a skill, different types of listening, active and passive listening, top-down approach, bottom-up approach, understanding the non verbal cues of communication; intonation and stress.

ACTIVITY: Narration of a story, Speech excerpts with different accents (Indian, British and American), listening comprehension exercises with audio and video excerpts.

UNIT - 5 **P-6**

IMPACT OF LANGUAGE ON PERSONALITY: Gender sensitive language in MNCs, cultural sensitivity, social awareness, emotional intelligence, good manners, self-grooming, positive body language, accepting and handling responsibility, assertiveness, problem solving, negotiating skills, networking and creating a good first impression.

Seven essential skills for a team player; attentive listening, intelligent questioning, gently persuading, respecting other's views, assisting others, sharing and participating actively.

ACTIVITY: Johari window, games and case studies.

BI 301 MOLECULAR EVOLUTION AND PHYLOGENETIC TREES

Course Description and Objectives:

This course deals with the basic concepts behind molecular evolution. This course aims to combine the concepts of molecular biology, evolutionary biology and population genetics to understand recent discoveries on the structure and function of nucleic acids and proteins.

Course Outcomes:

1. The students will be able analyze the techniques and methods used in molecular evolution and phylogeny in processing the molecular data in building phylogenetic trees.
2. They will be able to study epidemiology based on molecular data.
3. They will be able to measure genetic change by performing sequence alignment
4. They will understand the basic principles behind molecular clock hypothesis
5. They will understand the applications of molecular phylogeny approaches in reconstructing species trees.

UNIT I : Introduction To Molecular Evolution :

Archaeology of the genome- fundamentals of Population genetics-The nature of molecular evolution- Driving forces in evolution, evolutionary changes in nucleotide sequences.

UNIT II : Molecular Phylogenetics :

Terminology of phylogenetic trees- Trees and distances- Molecular phylogenetic archaeology - Molecular phylogenetic examples- The universal phylogeny.

UNIT III : Measuring Genetic Change- Sequence Alignment and Homology :

Genetic distance-Measuring evolutionary change on a tree- kinds of data- Methods of reconstruction- Distance matrix methods, Maximum parsimony methods, Maximum likelihood methods- analysis of true tree- Problems associated with phylogenetic reconstruction

UNIT IV: Models Of Molecular Evolution- Modes Of Evolutionary Process :

Functional constraints and the rate of substitution patterns of codon usage and base composition- Molecular clocks, evaluation of molecular clock hypothesis - Neutral theory- Genetic variation within species- Natural selection.

.

UNIT V : Applications Of Molecular Phylogenetics :

Organismal phylogeny- Gene trees and species trees- Age and rates of diversification phylogeny in molecular epidemology- Host parasite co- speciation.

(CS 223) OBJECT ORIENTED PROGRAMMING THROUGH JAVA

Course Description and Objectives:

This course deals with the various aspects of object oriented programming through java. The main objective of this course is to make students aware of the fundamentals of object-oriented programming in Java, including defining classes, invoking methods, using class libraries.

Course Outcomes:

1. Students will understandOOP concepts and basics of java programming (Console and GUI based)
2. They will acquire the skills to apply OOP and Java programming in problem solving
3. They will gain the ability to extend his knowledge of Java programming further on his/her own.
4. They will be able to understand the Applet Class, Applet Architecture and how to pass parameters to Applets
5. They will be able to utilize the knowledge gained from this course to write programs effectively.

UNIT I : Introduction, Classes and Objects :

Creation of Java, Importance of Java to Internet, Byte code, Java buzzwords, OOP Principles- Encapsulation, Inheritance and Polymorphism, Data types, Variables, Declaring variables, Dynamic initialization, Scope and life time of variables, Arrays, Operators, Control statements, Type conversion and casting, Compiling and running of simple Java program, Concepts of classes and objects Class fundamentals – Declaring objects, Assigning object reference variables, Introducing methods, Constructors, Usage of static with data and methods, Usage of final with data, Access control, this key word, Garbage collection, Overloading methods and constructors, Call by value, Recursion, Nested classes and Inner classes, Exploring the String class.

UNIT II : Microbial growth kinetics :

Basic concepts, Member access rules, Usage of super key word, Forms of inheritance, Method overriding, Abstract classes, Dynamic method dispatch, Using final with inheritance, the Object class. Defining, Creating and Accessing a Package, Understanding CLASSPATH, Importing packages, Differences between classes and interfaces, Defining an interface, Implementing interface, Applying interfaces, Variables in interface and Extending interfaces.

UNIT III : Exception Handling, Multithreading :

Concepts of Exception handling, Types of exceptions, Usage of try, Catch, Throw, Throws and Finally keywords, Built-in exceptions, Creating own exception Sub classes, Concepts of Multithreading, Differences between process and thread, Thread life cycle, Creating multiple threads using Thread class, Runnable interface, Synchronization, Thread priorities, Inter thread communication, Daemon threads, deadlocks, Thread groups.

UNIT IV: Applets, Event Handling & AWT Controls:

Applets: Applet Class, Applet Architecture, Applet Skeleton - Applet Initialization and Termination, Overriding update(), Simple Applet, Display Methods, Requesting Repainting - A simple banner Applet, Using The Status Window, The HTML APPLET Tag, Passing parameters to Applets, Applet Context and show Document.

Event Handling & AWT Controls : Event sources, Event classes – ActionEvent, AdjustmentEvent, ComponentEvent, Container Event, Focus Event, InputEvent, ItemEvent, KeyEvent and MouseEvent, Delegation event model, Event Listeners, Handling mouse and Keyboard events, Adapter classes.

UNIT V: AWT & Swing :

AWT: Concepts of components, Container, Panel, Window, Frame, Canvas, Font class, Color class and Graphics. AWT Controls : Buttons, Labels, Text fields, Text area, Check boxes, Check box groups, Lists, Choice, Scrollbars, Menus, Layout Managers - Flow, Border, Grid, Card and Grid bag.

Swing: JApplet, JFrame and JComponent, Icons and Labels, Handling threading issues, Text fields, Buttons – The JButton class, Check boxes, Radio buttons, Combo boxes, Tabbed Panes, Scroll Panes, Trees, and ables.

IT 314 SCRIPT PROGRAMMING

Course Description and Objectives:

The course introduces students to algorithmic programming using two scripting languages widely used for web applications: PHP and JavaScript. Because web applications typically draw parts of their content from online databases, the course will make them aware of PHP's facilities for interacting with database systems.

Course Outcomes:

1. Students will be able to explain the structure of the HTTP protocol for exchanging messages over the Internet
2. Identify the features of web servers needed to support PHP and a local database
3. They will be able to perform python programming
4. They will be able to perform Php programming
5. They will be able to perform Windows powershell programming

UNIT I : Script and Perl :

Introduction to Script programming in Linux and MS-windows, Perl programming.

UNIT II : Python programming :

Running Your Python Scripts from a Command Prompt Making Your Scripts Behave Like Normal Programs A Simple CGI Script Writing the Editor Script Writing the Save Script Running the Editor. Writing the Main Script Writing the View Script Writing the Edit Script Writing the Save Script Trying It Out.

UNIT III : Php programming :

Writing php first script, a script to acquire user input, file upload forms and scripts, Calling an External CGI Script with the virtual function getting information about php and your script.

UNIT IV : Windows Power shell programming :

Using power shell scripts, debugging power shell script.

UNIT V : Application Development :

Applications development with Client/server architecture, graphs, GUI and graphics programming using script languages searching and search engine development using script languages.

TEXT BOOKS :

1. Programming Perl, 3rd Edition By Larry Wall, Tom Christiansen, Jon Orwant O'Reilly
2. Beginning Python: From Novice to Professional, Magnus Lie Hetland, Apress, 2003.

MS 310 MANAGERIAL ECONOMICS (ELECTIVE - III)

Course description and ObjectiveS:

To make the students familiar with Economic, Accounting & Financial concepts used to help the managers in taking Business Decisions.

Course Outcomes:

1. Student will be able to undesrastand the basic concepts of managerial economics
2. They will gain adequate knowledge in cost analysis
3. They will acquire sufficient skills to interpret pricing and profit management
4. They will be able to perform various ratio analyse

UNIT – I : Introduction to Managerial Economics :

Nature & Scope relation of Managerial Economics with the functional areas of business organization. Role of Managerial Economist

Demand Analysis: Types of Demand, Demand determination, Demand elasticities, Demand forecasting, Survey & Statistical methods.

UNIT – II : Production and Cost Analysis production function:

Marginal rate of technical substitution, iso-quants and iso-costs, production function with one/two variables, cobb-douglas production function, Factor productivities and returns to scale.

Cost Analysis: Cost concepts, cost determinants, cost output relationship in the short and long run.

UNIT – III : Pricing and Profit Management:

Features and types of different competitive situations – Perfect competition, monopoly, monopolistic and oligopoly, pricing methods in practice.

UNIT – IV : Profit Management:

Nature and theories of profit. Cost – Volume – Profit Analysis.

UNIT – V : Ratio Analysis :

Introduction to ratios, Advantages and disadvantages of ratio analysis, Types of ratios – liquidity, solvency, turnover and profitability ratios.

TEXT BOOKS :

1. Gupta, “Managerial Economics” TMH, 1/e, 2005.

BT 307 PLANT BIOTECHNOLOGY (ELECTIVE-I)

Course Description and Objectives:

The Course is designed to provide concepts and industrial applications in the field of agricultural biotechnology. Production of high yielding,disease resistant crop varieties by using plant transformation technology. Concepts of Plant Molecular farming and production of plantibodies from Genetically modified organisms. To enable students to participate in R&D projects, develop laboratory and research skills.

Course Outcomes:

The students will develop fundamental knowledge in Plant Biotechnology and its application in laboratory and industry settings.

The students will:

1. Acquaint with principles, technical requirement, scientific and commercial applications in Plant Biotechnology,
2. Become familiar with sterile techniques, media preparation, DNA extraction methods, gene isolation and sequence analysis,
3. A knowledge of *Agrobacterium* and its development as a transformation vector & critically assess various plant genetic modification strategies
4. Knowledge of how plants can be transformed with respect to pest resistance, herbicide tolerance,
5. Support methodologies in plant tissue/cell culture to plant improvement, understanding how breeding strategies can be targeted to crops

UNIT I : Introduction to Tissue Culture & Applications:

Introduction to cell and tissue culture; Tissue culture media (composition, preparation); Initiation and maintenance of callus and cell suspension culture, organogenesis; Protoplast isolation culture and fusion;Production of haploids, Somaclonal variations,Germplasm conservation (Cryopreservation); Hardening & Field transformation of cultured Plants; Bioreactors systems and models for mass cultivation of plant cells.

UNIT II: PLANT TRANSFORMATION TECHNOLOGY:

Agrobacterium mediated gene transfer; Agrobacterium based vectors, viral vectors and their application. Direct gene transfer methods; chemical methods, electroporation, microinjection, particle bombardment.

UNIT III:PLANT GENETIC ENGINEERING FOR PRODUCTIVITY AND PERFORMANCE (BIOTIC STRESS & ABIOTIC STRESS):

Herbicide resistance, Insect resistance, Disease resistance, virus resistance,. Abiotic stress tolerance ;(Drought, temperature, salt).

UNIT IVII MOLECULAR FARMING & INDUSTRIAL PRODUCTS:

Application of Plant biotechnology for the production of quality oil, Industrial enzymes, Therapeutic Proteins ,Antigens (edible vaccine) and plantibodies.

UNIT V: METABOLIC ENGINEERING:

Concepts of Production of secondary metabolites from plant; Metabolic engineering for plant primary metabolites and secondary metabolites.

TEXT BOOKS:

1. H.S. Chawla, A Text Book of “Plant Biotechnology”, 2nd ed., Oxford & IBH, New Delhi, 2002.
2. H.K.Das, Text Book of Biotechnology -Wiley India, (P) Ltd. New Delhi, 5th edition, 2007.

BI 303 HERBAL BIOTECHNOLOGY

Course Description and Objectives:

This course deals with utilization of medicinal plant wealth in India. The main objective of this course is to generate interest in learning the medicinal plant wealth of India also to provide adequate knowledge in utilization of medicinal properties of various medicinal plants.

Course Outcomes:

Upon completion of the course, student will

1. Be able to identify major plants used in traditional system of herbal medicines
2. Be able to cultivate and utilize the available major medicinal plants in India
3. Be able to perform tissue culture for extraction of secondary metabolites
4. Be able to perform various assays of herbal drugs
5. Be able to extract secondary metabolites from various plant parts

Unit –I: Medicinal Plants and Crude drugs :

Medicinal plants in the traditional system (Ayurveda, Siddha, Unani and Homeopathy). Crude Drugs – Scope & Importance, Classification (Taxonomical, Morphological Chemical, Pharmacological); Cultivation, Collection & processing of Crude Drugs

Unit-II : Production of Medicinal Plants

Cultivation and Utilization of Medicinal & Aromatic Plants in India. Tissue Culture of medicinal Plants. Plant Tissue Culture as source of medicines, Plant Tissue Culture for enhancing secondary metabolite production (Withania somnifera, Rauwolfia serpentina, Catheranthus roseus, Andrographis paniculata, Dioscorea sp.).

Unit-III : Extraction and evaluation of crude extracts

Herbal extraction methods: steps, solvents, equipments. Types of herbal extract preparations and storage methods. Methods of Drug evaluation (Morphological, Microscopic, Physical & Chemical). Preliminary methods.

Unit-IV : Types of phytochemicals

Carbohydrates & derived products; Glycosides - extraction methods (Digitalis, Aloe, Dioscorea,); Tannins (Hydrolysable & Condensed types); Volatile Oils - extraction methods. Alkaloids - extraction methods (Taxus, Papaver, Cinchona); Flavonoids- extraction methods, Resins- extraction methods. Application of phytochemicals in industry and healthcare; Biocides, Biofungicides, Biopesticides

Unit-V: Methods to identify adulterants in Herbal medicines

PDrug adulteration – Types of adulterants. Chemical Methods of Analysis and Detection of Adulterants: Chemical estimations, Spectrophotometry & Fluorescene analysis. Molecular methods of Analysis and Detection of Adulterants in herbal medicines (RAPD, SSR, SCAR and RFLP). Plant DNA barcoding.

(BI305) NATURAL SELECTION : METHODS & APPLICATIONS (ELECTIVE-I)

Course Description and Objectives:

This course provides an overview about various evolutionary processes. The main objective of this course is to enable the students to understand the concept of evolution in biology.

Course Outcomes:

Upon completion of the course, the student will:

1. Be able to differentiate Darwinisim, Neutral theory and Neo-Darwinism
2. Be able to utilize the concepts of natural selection and neutral variation to critically understand the process of speciation
3. Be able to correlate nucleotides, genetic codes and codon biases
4. Be able to utilize the statistical tools to detect/measure molecular adaptation
5. Be able to explain process of aging with the help of Hamiltonian theory and other non-evolutionary theories of aging

Unit I: Introduction to Evolutionary Biology :

Introduction to Evolutionary Biology: meaning and importance of evolution in biology. A brief history of life. The development of evolutionary theoryLamarckism, Darwinism, Natural selection, Neo-Darwinism and Mutation theory. Evolution of diseases: some examples.

Unit II: Natural selection, Genetic drift and Mutation :

Variations- nature and types. Mechanisms that decrease and increase variations (natural selection, genetic drift, mutation, recombination and gene flow). Speciation: Modes of speciation, isolating mechanisms, speciation in time. Fitness landscape of an evolving population.

Unit III : Identifying Evolution Signatures in Molecules and Neutral theory :

Structure of the genetic material, Mutation of genetic sequences, Genetic code, Nucleotide and Codon Biases, Synonymous and Non-synonymous nucleotide substitution, Neutral theory of molecular evolution.

Unit IV : Statistical methods for detecting molecular adaptation :

Measuring selection using the nonsynonymous/synonymous (dN/dS) rate ratio, Estimation of dN and dS between two sequences, Detecting lineage-specific episodes of darwinian selection, Detecting amino acid sites under darwinian selection, Limitations of current methods and future directions.

Unit V : Evolution of Ageing and Late life :

Evolutionary theories of aging : Hamilton's Forces of Natural Selection, Comparative Biology of Aging, Specific Population Genetic Hypotheses for Aging. Hamiltonian theories of aging. Evolutionary biology of late life: The Discovery of Late Life, Explaining Late Life with Hamiltonian Theory, Explaining Late Life with Nonevolutionary Theories.

Text Books :

1. Natural Selection: Methods and Applications. Mario A. Fares (Editor). CRC Press.
2. Experimental Evolution: Concepts, Methods, and Applications of Selection Experiments, edited by Theodore Garland, Jr., and Michael R. Rose.

CS 229 OBJECT ORIENTED PROGRAMMING LAB

Course Description and Objectives :

Write programs using the Java language. Basic topics considered are programs and program structure in general, and Java syntax, data types, flow of control, classes, methods, objects, arrays, exception handling, recursion, and graphical user interfaces (GUIs). Writing and testing applets for potential inclusion in web pages. Understanding how to access enterprise data bases from the application programe.

Course Outcomes :

The student is expected to have hands on experience with the following:

1. Students will learn the basics of java programming, multi-threaded programs and Exception handling
2. They will be able to apply the OOP in Java programming in problem solving
3. They will be able to use use GUI components (Console and GUI based)

LIST OF EXPERIMENTS :

1. Write a Java program that prompts the user for an integer and then prints out all prime numbers up to that. Integer.
2. Write a Java program that checks whether a given string is a palindrome or not.

   Ex: MADAM is a palindrome.
3. Write a Java program for sorting a given list of names in ascending order.
4. Write a Java Program that reads a line of integers, and then displays each integer, and the sum of all the integers (use StringTokenizer class)
5. Write a Java program that reads a file and displays a file and displays the file on the screen, with a line number before each line.

6. Write a Java program that displays the number of characters, lines and words in a text file.
7. Write a Java program for creating multiple threads

   a) Using Thread class.

   b) Using Runnable interface.
8. Write a Java program that illustrates how run time polymorphism isachieved.
9. Write a java program that illustrates the following
   a) Creation of simple package.
   b) Accessing a package.
   c) Implementing interfaces.
10. Write a java program that illustrates the following
    a) Handling predefined exceptions.
    b) Handling user defined exceptions
11. APPLETS
    a) Working with Frames and various controls.
    b) Working with Dialogs and Menus.
    c) Working with Panel and Layout.
    d) Incorporating Graphics.
    e) Working with colors and fonts
12. SWINGS

    Jpanel- Jframe – Jtoolbar—JwindowFramework

IT 305 SCRIPT PROGRAMMING LABORATORY

Course Description and Objectives :

This course deals with the concepts and basics of Perl programme for a beginner. The major objective of this course is to train students to write their own programs using perl language.

Course Outcomes:

1. Students will be able to wite Perl program for concatenating two sequences
2. They will be able to write Perl program for calculating the length, total bases, GC and AT counts
3. They will be able to write Perl program for DNA to RNA transcription
4. They will be able to write Perl program **to** translate DNA into protein.

LIST OF EXPERIMENTS:

1. Perl program for concatenating two sequences
2. Perl program for file handling
3. Perl program for handling scalar and array variables
4. Perl program for calculating the length, total bases, GC and AT counts
5. Perl programme-Depicting loop functions
6. Perl program for DNA to RNA transcription
7. Retrieving protein sequences and locating motifs
8. Evaluating In silico Salient features of DNA
9. Perl Program to translate DNA into protein
10. Bio-perl programme to retrieve DNA sequence from swissprot.

BI 307 CONSTRUCTION OF PHYLOGENETIC TREES LABORATORY

Course Description and Objectives:

This lab course offers training in performing various methods to construct phylogenetic trees. The major objective of this lab course is to provide student adequate hand-on experience to work with softwares.

Course Outcomes :

1. Student will be able to perform pairwise and multiple sequence alignment
2. They will be able to perform neighbor joining method for tree construction
3. They will be able to perform Minimum evolution method for tree construction
4. They will be able to perform Maximum likelihood method for tree construction
5. They will be able to perform basic analysis in phylogeography

List of Experiments:

1. Introduction – uses of trees.
2. History and philosophy of phylogenetics, concept of homology, choice of characters.
3. Sequences as phylogenetic characters.
4. Sequence alignment, data matrices.
5. Introduction to parsimony, rooting trees.
6. Parsimony methods, weighting characters.
7. Assessing support; Introduction to maximum likelihood.
8. Maximum likelihood and models of sequence evolution.
9. Maximum likelihood and models of sequence evolution.
10. Distance-based phylogenetic methods; Comparison of tree reconstruction methods.
11. Species concepts; Gene trees versus species trees
12. Phylogeography.

TEXT BOOK :

1. Molecular evolution and Phylogenetics 2000. Nei & Kumar.

CS 222 DATABASE SYSTEMS

Course Description and Objectives:

The objective of the course is to present an introduction to database management systems, with an emphasis on how to organize, maintain and retrieve - efficiently, and effectively - information from a DBMS.

Course Outcomes:

1. Students will be able to describe the fundamental elements of relational database management systems
2. They will be able to explain the basic concepts of relational data model, entity-relationship model, relational database design, relational algebra and SQL.
3. They will be able to design ER-models to represent simple database application scenarios
4. They will be able to convert the ER-model to relational tables, populate relational database and formulate SQL queries on data.
5. They will be able to improve the database design by normalization.

UNIT- I : Database System- concepts and architecture:

Data modelling using the Entity Relationship (ER) modelling and Enhanced Entity Relationship (EER) modelling, Specialization and Generalization.

UNIT-II : The Relational Model:

Relational database design using ER to relational mapping, Relational algebra and relational calculus, Tuple Relational Calculus, Domain Relational Calculus, SQL.

UNIT-III : Database design theory and methodology:

Functional dependencies and normalization of relations, Normal Forms, Properties of relational decomposition, Algorithms for relational database schema design.

UNIT-IV : Transaction processing concepts:

Schedules and serializability, Concurrency control, Two Phase Locking Techniques, Optimistic Concurrency Control, Database recovery concepts and techniques.

UNIT-V : Data Storage and indexing:

Single level and multi level indexing, Dynamic Multi level indexing using B Trees and B+ Trees, Query processing and Query Optimization, Introduction to database security.

TEXT BOOK:

1. Ramez Elmasri and Shamkant B. Navathe, Fundamentals of Database Systems (5/e), Pearson Education, 2008

BI 302 GENETIC ENGINEERING & EPIGENETICS

Course Description and Objectives:

This course deals with the basics of gene regulation and expression in prokaryotes as well as eukaryotes. The main objective of this course is to provide fundamental knowledge in DNA technology and also to provide basic concepts of epigenetics.

Course Outcomes

Student will:

1. Student will be able to demonstrate the mechanisms behind regulation of gene expression in prokaryotes and eukaryotes
2. They will be able to choose the appropriate vector for their research work
3. They will be able to construct cDNA library
4. They will be able to devise various strategies in recombinant DNA technology to be used in epigenetic technology

Unit I: Gene Regulation and Expression in Prokaryotes & Eukaryotes:

Lactose, Arabinose and Tryptophan operons, Repressors and activator, Sigma switch in Bacillus subtilis. Gene regulation in Eukaryotic system, Repetitive DNA, Gene rearrangement, Promoters, enhancer elements, gene amplification

Unit II: Plasmids, Transposons / Vectors for Gene Transfers :

Plasmids: Definition, types, Identification, classification and purifications and transfer of Plasmids. Host restriction in transfer. Transposable elements: Definition, detection of transposition in bacteria, types of bacterial transposons, mechanisms of transposition and excision, applications of transposons. Retrotransposons.

UNIT III: DNA Technology :

Purification of genomic DNA from living cells, Manipulation of purified DNA; construction of prototype vector (pBR 322), different types of cloning vectors (plasmid – pUC 19, ? phage, cosmid, M13). Enzymes involved in genetic engineering; cloning strategies, Introduction of DNA into living cells. Methods of Gene transfer, Restriction mapping.

UNIT –IV Expression and Detection of clones :

Detection of clones and its expression: Expression of cloned genes in yeast & E.coli. Blot analysis - Southern, Northern & Western blot; dot and slot blot. Immunological techniques. DNA methylation, DNA hybridization. Genomic and cDNA library construction and application. DNA sequencing.

Unit V: Introduction to Epigenetics :

The basics of DNA methylation and histone modification, Epigenetic technology, Model organisms of epigenetics, Functions of epigenetics, Epigenetics and human diseases.

TEXT BOOK :

1. Old RW, Primrose SB, principles of Gene manipulation, An introduction to Genetic engineering, Blackwell Scientific Publications, 1993

(BI 304) ETHNOBOTANY GENOMICS (ELECTIVE - II)

Course Descritpion and Objectives:

This course deals with the concepts and principles of ethnobotany genomics. The main objective of this course is to provide sufficient insights into the concept of DNA barcoding and relate it to the the contemporary Issues in Ethnobotany.

Course Outcomes:

1. Students will learn the he sociological and anthropological terms of Ethnobotany genomics.
2. They will be able to understand the link between the ethnobotanical knowledge and tribal communities.
3. They will acquire skills in various methods of ethnobotanical research methods such as Practical and field skills; Prior Informed Consent, PRA techniques, interviews and questionnaire methods
4. They will be able to make plant voucher specimens for further utilization
5. They will be able to utilize the concept of Plant DNA barcoding for the correct identification of species.
6. They will be able to choose the right barcode for DNA barcoding.

Unit I : An Introduction to Ethnobotany :

A brief history of ethnobotanical studies in the world and in India. Scope of ethnobotany. Subdisciplines of ethnobotany. Interdisciplinary approaches. Knowledge of sociological and anthropological terms. Distribution of tribes in Southern India. Ethnobotanical knowledge and communities: Ethnobotanical classification; Folk Taxonomy of Plants.

Unit II : Collection, Documentation and Study Design

Sources of ethnobotanical data: Primary - archeological sources and inventories, Secondary - travelogues, folklore and literary sources, herbaria, medicinal texts and official records. Methods in ethnobotanical research. Research design and cautions in data collections, Practical and field skills; Prior Informed Consent, PRA techniques, interviews and questionnaire methods, choice of resource persons.

Unit III : Assemblage of traditional & scientific knowledge :

Ethnobotany Genomics: Identification and preservation of plant voucher specimens. Concept of DNA barcoding. Single locus and multi locus barcodes. Characterestics of an Ideal Barcode. Procedure of DNA barcoding. Data Standards for BARCODE Records by CBOL. Utility of BOLD (Barcode of Life Data systems). Single nucleotide polymorphisms (SNPs) as Species Specific Marker.

Unit IV : Choosing and Using a Plant DNA Barcode :

Various loci as plant DNA barcodes (plastid and nuclear regions). Selection of a core-barcode. Alternative sources of markers. Factors Influencing the Discrimination Success of Plant Barcodes**: Impacts of intra-specific gene flow on species discrimination success.** Informatics support tools for data management and analysis.

Unit V : Contemporary Issues in Ethnobotany :

The multidimensionality of human-plant interactions. Ethnobotany, socio-environmental change and globalization. Ethnoecology and symbolic ecology. Ethnobotany and forest product development. Conservation and environmental governance

Text Books :

1. Ethnobotany: Principles and Applications. C. M. Cotton. 2003. Wiley Publications.
2. DNA Barcodes: Methods and Protocol. 2007. W. John Kress, David L. Erickson

References Book :

(BI 306) CODON EVOLUTION AND TEMPORAL DYNAMICS (ELECTIVE - II)

Course Description and Objectives :

This course deals with the basics of evolution of codons. The main objective of this course is to provide the students adequate knowledge about evolution of codons also to provide them an introduction about various models of codon evolution

Course Outcomes :

1. Students will be able to understand the basic concepts of codon evolution
2. They will be able to able to utilize various models of codon evolution to conduct independent study on various model organisms
3. They will be able to Identify the influence of natural selection in shaping codon usage
4. They will be able to detect and analyse conservation at synonymous sites
5. They will be able to devise machine learning approaches for codon usage analyses.

Unit 1: Introduction :

Background, Parametric Models of Codon Evolution, Empirical and Semi-empirical Models of Codon Evolution.

Unit II: Monte Carlo and LiBaC approaches for Codon Models :

Monte Carlo Computational Approaches in Bayesian Codon Substitution Modeling, Likelihood Based Clustering (LiBaC) for Codon Models, Detecting and Understanding Natural Selection

Unit III: Parametric Codon Models and Natural Selection :

Codon Models as a Vehicle for Reconciling Population Genetics with Interspecific Sequence Data, Robust Estimation of Natural Selection Using Parametric Codon Models.

Unit IV: Codon Models :

Simulation of Coding Sequence Evolution, Use of Codon Models in Molecular Dating and Functional Analysis, Codon Models Applied to the Study of Fungal Genomes

Unit V: Codon Usage Bias :

Measuring Codon Usage Bias, Detection and Analysis of Conservation at Synonymous Sites, Distance Measures and Machine Learning Approaches for Codon Usage Analyses

Text Book :

1. Codon Evolution:Mechanisms and Models Edited by Gina M. Cannarozzi and Adrian Schneider. Oxford University Press.

References Book :

BT 302 ANIMAL BIOTECHNOLOGY (ELECTIVE-II)

Course Description & Objectives :

The course provides an overview of current developments in different areas of animal biotechnology. It imparts in vitro reproductive techniques for sperm, ovum and embryo manipulation.It helps in ellucidating structural, functional and comparative genomics of farm animals and its application for livestock improvement.The course comprehends the application of immunological techniques in biotechnology and appreciates the principles of animal cell culture and its application.

Course Outcomes :

At the end the students will demonstrate the ability in / to

1. Development of primary cultures
2. Development of established cell culture.
3. Assess the effect of factors and their role in cell functions.
4. Develop awareness in interlinking of different fields for the development of biological organs.

UNIT- I: Animal cell culture techniques and media :

Cell culture techniques including primary and secondary culture, cell lines, suspension culture, organ culture etc. Different type of cell culture media, growth supplements, serum free media, balanced salt solution, culture of different tissues and its applications. Behavior of cells in culture conditions, division, growth pattern and metabolism, estimation of cell number and cell viability, MTT assay. Quantification of cells by trypan blue dye exclusion method.

UNIT-II: Development and maintenance of Cell Lines :

Development of cell lines, characterization and maintenance of cell lines, stem cells, cryopreservation, common cell culture contaminants. Cryopreservation of primary cell cultures and cell lines. Effect of viruses on cultured mammalian cells. Cloning of domestic animals. Conservation of endangered species.

UNIT-III: Immunodiagnostics :

Somatic cell hybridization, hybridoma technology, commercial production of antibodies using monoclonal antibodies, screening of hybrids for production of monoclonal antibodies. Application of antibodies in chemiluminescence and fluorescence assay used, antibody based nucleic acid probes and their applications in ELISA.

UNIT-IV : Reproductive Technology :

Assisted reproductive biotechnology in man and animal, introduction to embryo biotechnology, endocrine therapeutics. methodology of super ovulation, *in vitro* fertilization, embryo culture and micromanipulation, preparation of sperm for IVF. Different methods of gene transfer and their limitations, sperm mediated gene transfer, embryo splitting, production of transgenic livestock by nuclear transfer and its application, regulatory issues.

Unit-V : Animal Genomics :

Characterization of animal genomes, SNP, STR, QTL, RFLP, RAPD, genetic basis for disease resistance, transgenic animal production and application in expression of therapeutic proteins. Nucleic acid based methods for identification of animal species, detection of meat adulteration using DNA based methods, identification of wild animal species using DNA based methods. Brief introduction on Software tools for molecular phylogeny

Test Books:

BI 310 BIOMEDICAL INFORMATICS

Course Description and Objectives :

This course deals with the basics and applications of Biomedical informatics. The main objective of this course is to introduce the basic concepts of Biomedical informatics and to provide the students adequate knowledge about computer applications in health care and biomedicine

Course Outcomes :

1. Student will be able to acquire, store and use biomedical data.
2. They will be able to acquire a general understanding about the computer application in healthcare and biomedicine
3. They will gain knowledge in the ethics that must be followed in Biomedical and health informatics
4. They will be able to to know the functioning of electronic health record systems and management of information in health care organizations.

Unit I: Introduction to Biomedical Informatics :

Biomedical Informatics: The Science and the Pragmatics, Biomedical Data: Their Acquisition, Storage, and Use, Biomedical Decision Making: Probabilistic Clinical Reasoning, Cognitive Science and Biomedical Informatics.

Unit II: Computer architecture and standards in Biomedical Informatics :

Computer Architectures for Health Care and Biomedicine, Software Engineering for Health Care and Biomedicine, Standards in Biomedical Informatics, Natural Language Processing in Health Care and Biomedicine.

Unit III: Biomedical and Health Information Resources :

Biomedical Imaging Informatics, Ethics in Biomedical and Health Informatics: Users, Standards, and Outcomes, Evaluation of Biomedical and Health Information Resources.

Unit IV: Information management :

Electronic Health Record Systems, Health Information Infrastructure, Management of Information in Health Care Organizations, Patient-Centered Care Systems, Public Health Informatics, Consumer Health Informatics and Personal Health Records

Unit V: Health care management :

Telehealth, Patient Monitoring Systems, Imaging Systems in Radiology, Information Retrieval and Digital Libraries, Clinical Decision-Support Systems, Computers in Health Care Education

Text book :

1. Biomedical Informatics by Shortliffe and Cimino. 2007, Springer

Reference Book :

1. Health Care Informatics: An Interdisciplinary Approach by Sheila P. Englebardt, Ramona Nelson, 2010.

L	T	P	To	C
4	-	-	4	4

BI 312 UNIX PROGRAMMING

Course Description and Objectives :

This course deals with the design, build, and use of software tools that fit well into Unix, writing such tools both in the Bourne Shell and in C, using Unix arguments and standard input and output facilities. The main objective of this course is to train the students to design modest-sized program using independent modules (abstract data typesHrs), that offer some potential for reuse·

Course outcomes :

1. Students will be able to use standard C libraries and their associated header files effectively in writing programs.
2. The course will enable students to effectively use Unix and C to write, test, debug, and maintain modest-sized programs.
3. They will be able to design modest-sized program using independent modules (abstract data typesHrs)
4. They will gain adequate insights into the Signal Concepts, Signal handling.
5. They will gain expertise in writing Inter Process Communication

UNIT - I : Unix Utilities :

Introduction to UNIX file system, file handling utilities, security by file permissions,vi editor, process utilities, diskutilities, networkingcommands, cp,mv, ln, rm, unlink, mkdir, rmdir, du, df, mount, umount, find, umask, ulimit, ps,who, w, finger, arp, ftp, telnet, rlogin.

UNIT - II : Unix Utilities :

Text processing utilities and backup utilities detailed commands tobe covered are: cat, tail, head, sort, nl, uniq, grep, egrep, fgrep, cut, paste, join,tee, more, pg, comm., cmp, diff, tr, awk, tar. What is a shell, shell responsibilities,pipes and input redirection, output redirection, shell variables, conditions,history and control structures and shell programming.

UNIT - III : File I/O :

File descriptor, open function, close function, creat function, lseek, read, write, Filesharing, dup and dup2 functions, fcntl, ioctl functions.

Files and Directories :

File status,stat,fstat,lstat Functions, File types, Permission, ownership of new files and Directories, File system, Links, File times, Directory related functions.The System calls to be covered are access, umask, chmod, fchmod, chown, link, unlink, symlink, mkdir, rmdir, chdir, fchdir, getcwd, utime. **Standard I/O Library:** Streams, Buffering, open, read & write on streams, Binary I/O, Formatted I/O TemporaryFiles (fopen, fread, fclose, fflush, fseek, fgetc, getc, getchar, fputc, putchar).

UNIT - IV : Environment of Unix Process:

Process invocation and termination,Environment variables & List, Memory Layout of C program & memory management routines.

Process control : Process identifiers, fork, vfork, exit, wait, waitpid, wait3, exec Functions. Race conditions, Zombie process.

Signals : Signal Concepts, Signal handling, Important signals: kill, raise, alarm, pause, and abort.

UNIT - V : Advanced I/O :

Record Locking , Streams, I/O Multiplexing, Memory Mapped I/O, various Read and write.

Inter Process Communication :

Pipes, FIFO, System V IPC (Message Queue,Semaphore, Shared Memory Hrs).

Text Books :

1. Unix and shell Programming Behrouz A. Forouzan, Richard F. Gilberg.Thomson.

Reference Books :

1. Sumitabha Das - Unix: Concepts & Applications 4/e - TMH.
2. Advanced Programming in the UNIX environment W.R.Stevens

CS 228 DATABASE SYSTEM LABORATORY

Course Description and Objectives :

This lab course will enhance database handling, data manipulation and data processing skills in student through SQL & PL/SQL, and helps them gain knowledge in designing forms, Menus and also helps them in developing database applications.

Course Outcomes:

1. Students will be able to create and manipulate various DB objects for a table.
2. They will be able to create views, partitions and locks for a particular DB
3. They will be able to write PL/SQL block for transaction operations of a typical application using triggers
4. They will be able to implement the query in sql for
   (a) insertion (b) retrieval (c) updation (d) deletion.

List of Experiments :

1. Execute a single line and group functions for a table.
2. Execute DCL and TCL Commands.
3. Create and manipulate various DB objects for a table.
4. Create views, partitions and locks for a particular DB.
5. Write PL/SQL procedure for an application using exception handling.
6. Write PL/SQL procedure for an application using cursors.

7. Write a DBMS program to prepare reports for an application using functions.
8. Write a PL/SQL block for transaction operations of a typical application using triggers.
9. Implement the query in sql for a) insertion b) retrieval c) updation d) deletion
10. Creating Views
11. Writing Triggers
12. Implementing operation on relation using PL/SQL

Typical Applications : Banking, Course registration, Electricity Billing, Library Management, Pay roll, Insurance, Inventory etc.

Text books :

1. Oracle certified associate Mysql beginner's guide.
2. Oracle certified associate Oracle 10g &11g SQL fundament.

III Year B.Tech. Bioinformatics II - Semester

L	T	P	To	C
-	-	3	3	2

BI 314 UNIX PROGRAMMING LABORATORY

Course description and Objectives:

This course deals with the basics of UNIX programming protocols. This lab course will provide adequate exposure to students about shell scripting

Course outcomes:

1. Students will be able to gain adequate knowledge about the basics of UNIX Programming
2. They will be able to write a shell script to generate a multiplication table.
3. They will be able to write a shell script that copies multiple files to a directory.
4. They will be able to write a shell script which counts the number of lines and words present in a given file.
5. They will be able to write a shell script which displays the list of all files in the given directory.

Recommended Systems/Software Requirements:

Intel based desktop PC with minimum of 166 MHZ or faster processor with atleast 64 MB RAM and 100 MB free disk space LAN Connected.

Any flavour of Unix / Linux

Session - 1 :

a) Log into the system

b) Use vi editor to create a file called myfile.txt which contains some text.

c) Correct typing errors during creation.

d) Save the file

e) Logout of the system

Session - 2 :

a) Log into the system

b) open the file created in session 1(vi,cat,touch)

c) Add some text (cp,mv,rm,mkdir,rmdir,ls)

d) Change some text

e) Delete some text

f) Save the Changes

g) Logout of the system

session - 3 : Filters : (Text processing utilities) Wc, od, cmp, comm., diff, head, tail, cut, paste, sort,grep,uniq Disk&backup utilities Du,df,tar,cpio,ps,who

session - 4 :

1. Write a shell script to generate a multiplication table.
2. Write a shell script that copies multiple files to a directory.
3. Write a shell script which counts the number of lines and words present in a given file.
4. Write a shell script which displays the list of all files in the given directory.
5. Write a shell script(small calculator) that adds, subtracts,multiplies and divides the given two integers. There are two division options: one returns the quotient and the other returns reminder. The script requires 3 arguments: The operation to be used and two integer numbers. The options are add(-a), subtract(-s),multiply(-m), quotient(-c) and reminder(-r).
6. Write a shell script to reverse the rows and columns of a matrix

Session - 5 :

1. Write a C program that counts the number of blanks in a text file. using standard I/O using systemcalls. Imp a) using standard I/O b) using systemcalls.
2. Implement in Cthe following Unix commands using systemcalls.

   (a) cat (b) ls (c) mv
3. Write a programthat takes one ormore file/directorynames as command line input and reports the following information on the file: (a) File type. (b) Number of links, (c) Time of last access. (d) Read,Write and Execute permissions.
4. Writea C programthat illustrates howto execute two commands concurrentlywith a command pipe.
5. Write a Cprogramthat illustrates the creation of child process using fork systemcall.
6. Writea C programthat displays the real time ofa day every 60 seconds.
7. Writea C programthat illustrates file locking using semaphores.
8. Write a C program that implements a producer-consumer system with two processes. (using semaphores)
9. Write a C program that illustrates inter process communication using shared memory system calls.
10. Write a C program that illustrates the following:

    a) Creating a message queue (b) Writing to a message queue.

    c) Reading from a message queue.

BI 401 MOLECULAR MODELING & DRUG DESIGN

Course Description and Objectives :

This course provides an overall understanding about the critical relationship among biomolecular structure, function and force field models. The main objective of this course is to train students to utilize basic modeling techniques to explore biological phenomena at the molecular level.

Course Outcomes :

1. Students will be introduced to the principles and practice of Molecular modeling and modern drug discovery.
2. They will gain an awareness of rational drug design, based on understanding the three-dimensional structures and physicochemical properties of drugs and receptors will be created.
3. They will be able to perform monte carlo simulation
4. The will be able to predict the structure of a protein by 'Threading'
5. They will acquire fundamental principles of chemoinformatics.

Unit I: Introduction to Molecular Modelling:

Introduction - Useful Concepts in Molecular Modelling: Coordinate Systems. Potential Energy Surfaces. Molecular Graphics. Surfaces. Computer Hardware and Software. The Molecular Modelling Literature.

UnitII: Force Fields:

Force Fields. Bond Stretching. Angle Bending. Introduction to Non-bonded Interactions. Electrostatic Interactions. Van der Waals Interactions. Hydrogen Bonding in Molecular Mechanics. Force Field Models for the Simulation of Liquid Water.

Unit III : Energy Minimisation and Computer Simulation :

Energy Minimisation and Related Methods for Exploring the Energy Surface. Non-Derivative method, 1st and 2nd order minimisation methods. Computer Simulation Methods. Simple Thermodynamic Properties and Phase Space. Boundaries. Analyzing the Results of a Simulation and Estimating Errors. GROMACS and CNS.

Unit IV : Molecular Dynamics & Monte Carlo Simulation :

Molecular Dynamics Simulation Methods. Molecular Dynamics Using Simple Models. Molecular Dynamics with Continuous Potentials. Molecular Dynamics at Constant Temperature and Pressure. Metropolis Method. Monte Carlo Simulation of Molecules. Models Used in Monte Carlo Simulations of Polymers. Molecular Modeling software: BIOSUITE

Unit V : Structure Prediction and Drug Design :

Protein Structure Prediction - Introduction to Comparative Modeling. Sequence Alignment. Constructing and Evaluating a Comparative Model. Predicting Protein Structures by 'Threading', Molecular Docking, AUTODOCK and HEX. Structure based De Novo Ligand design, Drug Discovery - Chemoinformatics - QSAR.

Text book :

1. A. R. Leach, Molecular Modelling Principles and Application, Longman, 200l.

Reference Books:

l. J.M.Haile, Molecular Dynamics Simulation Elementary Methods, lohn Wiley and Sons, 1997.

3. Satya Prakash Gupta, QSAR and Molecular Modeling, Springer - Anamaya Publishers, 2008.

IV Year B.Tech. Bioinformatics	I - Semester	L	T	P	To	C
		4	-	-	4	4

BI 403 R - STATISTICS

Course Description and Objectives :

This course deals with the basic concepts of R-statistics. The main objective of this course is to provide students the skills to utilize R for basic statistics.

Course Outcomes :

1. Acquire basic concepts of R-Statistics
2. Be able to perform basic statistics using R
3. Gain adequate insights to the graphics in R
4. Be able to perform various models of simulations using R.

Unit I: Overview :

R help; help.search( ), R mailing list, contributed documentation on CRAN. Data types in R : numeric/character/logical; real/integer/ complex, strings and the paste command, matrices, dataframes, lists, Creation of new variables, Creation of patterned variables, Saving workspace/history.

Unit II: Graphics in R

The plot command, histogram, barplot, boxplot, points, lines, segments, arrows, inserting mathematical symbols in a plot, pie diagram, Customisation of plotsetting graphical parameters, adding text, saving to a file; Adding a legend.

Unit III: Basic statistics using R

One and two sample t tests, Bartletts test for variance,F test for equality of variances, multi sample means, Nonparametric tests, Chi squared tests, Exact tests and confidence intervals, Checking assumptions, distribution fitting.

Unit IV: Vector matrix operations :

Matrix operations such as addition, subtraction, multiplication,; Linear equations and eigenvalues, matrix decomposition – LU, QR and SVD; matrix inverse, G inverse : finding a basis, orthonormalisation, finding rank.

Unit V: Linear models :

The lm function; ANOVA/ANCOVA/regression, models, the summary function, goodness of fit measures, predicted values and residuals; the ANOVA table, confidence intervals and confidence ellipsoids; Multiple testing. Random no. generation & Simulations :rnorm, rchisq,rt, rbinometc; sample; set.seed, Monte Carlo techniques. Programming in R.

Text Book :

1. P.Dalgaard : Introductory Statistics with R, Springer, 2nd,2008.

Reference Books :

1. J.Maindonald&J.Braun : Data Analysis and Graphics Using R , Cambridge University Press, Cambridge, 2nd edition, 2007.

IV Year B.Tech. Bioinformatics	I - Semester	L	T	P	To	C
		4	-	-	4	4

BI 405 IMMUNOLOGY AND IMMUNOINFORMATICS

Course Description and Objectives :

This course deals with the basics of immune system. The main objective of this course is to provide the students adequate knowledge about host defense parameters and apply informatics tools to study immune diversity.

Course Outcomes :

1. Students will be able gain an overall understanding of the components of immune system.
2. They will learn various immunotechniques to evaluating the immune system
3. They will understand the degree of variation in immune susceptibility .
4. They will be able to evealuate degree of variation in immune susceptibility using immunoinformatics tools .

Unit I : Overview of Immune System:

Types of Immunity - Innate and Adaptive. Cells and organs of the immune system. Antigens – epitopes, antigenicity, factors influencing antigenicity. Antigen processing and presentation.

Unit II : Immunoglobulins:

Structure and types of Immunoglobulins, Biological activities. Monoclonal antibodies- production and applications. Cytokines – types and immune response. Complement system

Unit III : Antigen Antibody Interactions :

Antibody affinity and activity –precipitation, agglutination, Radio Immuno Assay, ELISA, Western blotting, Immunoprecipitation, Immunofluorescence, Flow cytometry for separation of immune cells. Major Histocompatiblity Complex (MHC). MLR.

Unit IV : T Cell & B Cell Activation :

T cell & B cell maturation, activation and differentiation. Leukocyte migration and inflammation. Hypersensitive reactions. Transplantation immunology

Unit V : Immunoinformatics :

Immunoinformatics - Introduction & Methods. Applications – prediction of epitopes, vaccine design, Web based tools for vaccine design. IMGT: the international ImMunoGeneTics database.

Text Books :

1. Richard A. Golds, Thomas J Kindt: Kuby Immunology, eds. Barbara Osborne. W.H.Freeman & Company, 4th edition, 2000.

2. Kenneth Murphy: Janeway's Immunobiology, Eighth Edition, Garland Science.

IV Year B.Tech. Bioinformatics	I - Semester	L	T	P	To	C
		4	-	-	4	4

BI 407 POPULATION GENETICS (ELECTIVE-III)

Course Description and Objectives :

This course deals with the basics of genetic and phenotypic variation and the organization of genetic variation. The main objective of this course is to provide adequate knowledge in Major evolutionary forces such as Selection, Mutation, Genetic Drift

Course Outcomes :

1. Student will be able to utilize Hardy-Weinberg equation to test the Hardy-Weinberg equilibrium

2. They will be able to identify the causes of linkage disequilibrium

3. They will be able to correlate random genetic drift and Coalescence theory

4. They will be able to understand the rationale behind the origin of various theories of Evolution

5. They will be able to utilize the concept of molecular clock in evolutionary biology research.

Unit I: Genetic and phenotypic variation :

Relevance of population genetics, Phenotypic variation in natural populations, Multiple-factor inheritance, Maintenance of genetic variation, Molecular population genetics, Polymorphisms in DNA sequences, Utility of genetic polymorphisms :

Unit II: Organization of genetic variation :

Random mating, the Hardy-Weinberg principle, testing for Hardy-Weinberg equilibrium, Extensions of the Hardy-Weinberg principle. Linkage and linkage disequilibrium, Causes of linkage disequilibrium.

Unit III: Random genetic drift :

Mutation and random genetic drift, Random genetic drift and binomial sampling, The Wright–Fisher model of random genetic drift, The diffusion approximation, Random drift in a subdivided population, Effective population size, Gene Trees And Coalescence, Theoretical Implications Of Coalescence.

Unit IV: Darwinian Selection and Neutral Theory :

Neutral Theory of Molecular Evolution, The Infinite-Alleles Model, Infinite-Sites Model, Mutation and recombination. Selection in haploid organisms, Selection In Diploid Organisms, Change In Allele Frequency In Diploids, Equilibria With Selection, Mutation-Selection Balance, Complex Types Of Selection, Interdeme Selection In Geographically Subdivided Populations, Selection In A Finite Population

Unit V: Inbreeding, Population Subdivision, and Migration :

Inbreeding, Population Subdivision, The Wahlund Principle, Assortative Mating, Migration, Estimating Rates Of Molecular Sequence Divergence, Molecular Clock. Patterns Of Nucleotide And Amino Acid Substitution, Polymorphism And Divergence In Nucleotide Sequence— The Mcdonald-Kreitman And Hka Tests.

Text Book :

1. Principles Of Population Genetics Fourth Edition, Daniel L. Hartl and Andrew G. Clark. Sinauer Associates, 2011 Inc. Publishers

Reference Book :

1. Population Genetics by Matthew Hamilton, 2009, Wiley Blackwell.

IV Year B.Tech. Bioinformatics	I - Semester	L	T	P	To	C
		4	-	-	4	4

BI 409 PROTEOMICS AND GENOMICS (ELECTIVE - III)

Course Description and Objectives :

This course deals with the basic concepts of proteomics and genomics. To develop skills of the students in the area of genomics and proteomics in both theory and research. To provide knowledge on genome, transcriptome and proteome analysis through computational methods.

Course Outcomes:

1. Students get interest in gene, genome, transcriptome and proteome analysis through computational methods.
2. Students come to know well about the genome features of prokaryote and eukaryote and also they may develop sequence analysis tools based on any genome and proteome feature.
3. Students will get interest in personalized medicine research.
4. Knowledge in the technique, methodology and application of Proteomics tools.
5. An overview of application of microarrays in medicine.

Unit I : Overview :

Research areas and related journals in genomics and proteomics - Concepts of central dogma - Structure and organization of prokaryotic & eukaryotic genome - Changes andregulation of genome activity in prokaryote and eukaryote - Brief outlook of various genome projects and their outcomes - Human genome project.

Unit II : Genome mapping and sequencing :

Mapping techniques - Genetic markers - RFLP, SSLP, STRs, VNTRs - Physical markers - EST, STS, FISH, SNP - Radiation hybrids - Mapping resources - Sequencing methods: chemical and enzymatic method - High throughput method - Automated sequencing methods - Whole genome shotgun sequencing method.

Unit III: Sequence assembly and annotation: Assembly of contiguous DNA sequence - shotgun, directed shotgun and clone contig approach - Genomic DNA library - cDNA library - Primer walking, Chromosome walking, Chromosome jumping - Tools for sequence assembly - Structural and functional genomics - Transcriptome and Microarray approach - Comparative genomics - Population genomics - Pharmacogenomics.

Unit IV : Proteomics :

Introduction to proteome - Proteome and technology - Information and the proteome - Importance of 2D Electrophoresis in proteomics - Protein identification in proteome projects - Primary and secondary attributes for protein identification -Cross species protein identification - Detection and analysis of co- and post-translational modification.

Unit V : Proteome databases :

Protein sequence databases - SWISS-PROT and TiE.MBL - Pattern and profile databases - PROSITE and BLOCKS - 2D PAGE databases - Structure databases - PDB - Metabolic databases - post translational modification databases - Application of proteomics to medicine, proteomics, toxicology and pharmaceuticals.

Text Books :

1. T.A. Brown, Genomes, 2nd edition, BIOS Scientific Publishers Ltd, 2002.
2. Marc R. Wilkins, Keith L. Williams, Ron D. Appel and Denis F. Hochstrasser Proteome Research: New Frontiers in Functional Genomics, Springer, 1997.

2. David W. Mount, Bioinformatics: sequence and genome analysis, 2nd edition, CBS publishers, 2004.
3. Pennington, Proteomics from protein sequence to function, 2nd edition, Viva Books Ltd, 2002.

IV Year B.Tech. Bioinformatics	I - Semester	L	T	P	To	C
		4	-	-	4	4

BT310 BIOETHICS, SAFETY AND INTELLECTUAL PROPERTY RIGHTS (ELECTIVE - III)

Course Description and Objectives :

This course helps to adhere to the ethical practices appropriate to the discipline at all times and to adopt safeworking practices relevant to the bioindustries & field of research :

Course outcomes :

1. Students will gain awareness about Intellectual Property Rights (IPRs) to take measure for the protecting their ideas
2. They will able to devise business strategies by taking account of IPRs
3. They will be able to assists in technology upgradation and enhancing competitiveness.
4. They will acquire adequate knowledge in the use of genetically modified organisms and its effect on human health
5. They will gain more insights into the regulatory affairs.

UNIT I: Engineering Ethics & Bioethics :

Senses of “Engineering Ethics”’ - variety of moral issued - types of inquiry - moral dilemmas - moral autonomy - Kohlberg’s theory - Gilligan’s theory - consensus and controversy – Models of Professional Roles - theories about right action - Self-interest - customs and religion - uses of ethical theories. Introduction to Bioethics. Social and ethical issues in Biotechnology Definition of Biosafety. Biosafety for human health and environment. Social and ethical issues. Use of genetically modified organisms and their release in to the environment. Special procedures for r-DNA based products, Transgenic plants and Animals.

UNIT II : Regulatory Affairs :

Regulation, national and international guidelines of Biosafety, r-DNA guidelines, Regulatory requirements for drugs and Biologics GLP and GMP.

UNIT III : Intellectual Property Rights :

Intellectual property rights and protection, patents and methods of application of patents, Trade Secrets copyrights, Trade Marks, legal implications, farmer's rights, plant breeder's rights. International and National conventions on biotechnology and related areas, WTO guidelines.

UNIT IV : Safety, Responsibilities and Rights:

Safety and risk - assessment of safety and risk - risk benefit analysis and reducing risk – the three mile island and case studies. Collegiality and loyalty - respect for authority - collective bargaining - confidentiality - conflicts of interest - occupational crime - professional rights - employee rights.

UNIT V : Global Issues :

Multinational corporations - Environmental ethics - computer ethics - weapons development and bioterrorisms - engineers as managers-consulting engineers - engineers as expert witnesses and advisors - moral leadership-sample code of Ethics.

Text Books :

1. Mike Martin and Roland Schinzinger, "Ethics in Engineering", McGraw-Hill, New York 1996.
2. Govindarajan M, Natarajan S, Senthil Kumar V. S, " Engineering Ethics", Prentice Hall of India, New Delhi, 2004.

Reference Books :

3. Edmund G Seebauer and Robert L Barry, "Fundamentals of Ethics for Scientists and Engineers", Oxford University Press, Oxford, 2001. 9. Singh K. "Intellectual Property Rights on Biotechnology", BCIL, New Delhi.

IV Year B.Tech. Bioinformatics I - Semester

L	T	P	To	C
4	-	-	4	4

BI 411 FORENSIC SCIENCE (ELECTIVE - IV)

Course Description and Objectives :

This course deals with the basics of forensic science. The main objective of this course is to provide adequate knowledge to the students about the Organization set-up of forensic laboratories.

Course Outcomes :

Upon completion of the course, the students will:

1. Gain sufficient knowledge in the various methods of Investigation
2. Know the significance of Narco Analysis as an Inverstigative tool
3. Gain certain insights into the Criminal Profiling
4. Acquire background knowledge in the history and development of police as an institution
5. Know about the qualifications and duties of a forensic scientist
6. Be able to differentiate various types of DNA finger prints and their applications

Unit I : Introduction to the basics of Forensic science :

History and Development of Forensic Science, Definition of Forensic Science, Scope of Forensic Science, Need of Forensic Science, Basic Principles of Forensic Science, Tools and Techniques of Forensic Science.

Unit II : Organization setup of forensic laboratories :

Organizational setup of Forensic Science Laboratories, CFSL, FSL, GEQD, FPB, NICFS, Central Detective Training School, NCRB (Maintenance of Crime Records), NPA Mobile Forensic Science Laboratory, Branch of Forensic Science, Forensic Science : its International Perspective.

Unit III : Methods of Investigation :

Modus Operandi and MOB and its role in Criminal Investigation, Methods of Investigation : Narco analysis :History, Importance as an investigative tool, methods as use of drugs, Hypnosis etc. Limitations and legal aspects. Ethics in Forensic Science.

Unit IV: Brain finger printing :

Concepts, History, Significance, method, future perspective of the technique, limitations. Criminal Profiling : Introduction, Importance, Profile of the victim and culprit, understanding *modus operandi*, investigative strategy, crime scene characteristics, criminal behavior on the internet, limitations. Various Police Organisations, Organisation of Police Station, Evolution of Police as an Institution, Role & Functions of Police,

Unit V: History and Development of Finger Print as a tool for Personal Identification :

Education of Forensic Science, Role of Media, Human Rights & Criminal Justice System. Duties of Forensic Scientist, Qualification of Forensic Scientist. Development of Finger Print as Science for Personal Identification, Type of Finger Prints, Classification of Finger Prints, Latent Finger Print, Causes of Formation of latent Finger Prints, Comparison of Finger Prints, ridge details. Presentation of Expert Evidence: Data, Reports, Evidence in the Court

Text Books :

1. Nanda, B.B. and Tewari, R.K. (2001) : Forensic Science in India : A vision for the twenty first century Select Publisher, New Delhi.
2. James, S.H and Nordby, J.J.. (2003) Forensic Science : An introduction to scientific and investigative techniques CRC Press, Barnett (2001): Ethics in Forensic Science.

Reference Books :

2. Osterburg : Crime Laboratory. Saferstien : Forensic Science, Handbook, Vol. I, II & III, Prentice Hall Inc. USA.

IV Year B.Tech. Bioinformatics	I - Semester	L	T	P	To	C
		4	-	-	4	4

BT415 BIOPHARMACEUTICAL TECHNOLOGY (ELECTIVE-IV)

Course Description and Objectives :

To give an awareness to the student about history, sources of drugs, pharmocodynamics and pharmacokinetics and drug manufacturing. Also about production and applications of biopharmaceuticals and drug delivery systems.

Course Outcomes :

Student gains knowledge on

1. History and sources of drugs, different dosage forms and routes of drug administration.
2. Pharmacodynamic and pharmacokinetic mechanisms
3. GMP, Manufacturing facilities, sources, production procedures, analysis and formulation of drugs and Biopharmaceuticals
4. Production and medical applications of therapeutic proteins like interferons, interleukins, insulin, erythropoietin, hGH etc.,
5. Biomaterials and different drug delivery systems.

UNIT I : Introduction to Pharmaceuticals :

History & Definition of Drugs. Sources of Drugs - Plant, Animals, Microbes and Minerals, Different dosage forms, Routes of drug administration.

UNIT II : Pharmacodynamics and Pharmacokinetics :

Physico-Chemical Principles, Pharmacodynamics- Mechanism of drug action, Drug receptors, and Physiological receptors: structural and functional families. Pharmacokinetics - Drug absorption, Factors that affect the absorption of drugs, Distribution of drugs, Biotransformation of drugs, Bioavailability of drugs.

UNIT III : Drug manufacturing processes :

Good manufacturing practices, Manufacturing facilities, Sources of Biopharmaceuticals, Production & analysis of Biopharmaceuticals. Recent advances in the manufacture of drugs using r-DNA technology.

UNIT IV : Production and Applications of Biopharmaceuticals:

Production of Therapeutic Proteins, Hormones, Cytokines - Interferon's, Interleukins I & II, Tumor Necrosis Factor (TNF); Nucleic acids. Role of Biopharmaceuticals in treatment of various health disorders

UNIT V : Drug Delivery Systems, Biomaterials & their Applications :

Controlled and sustained delivery of drugs. Biomaterial for the sustained drug delivery. Liposome mediated drug delivery. Drug delivery methods for therapeutic proteins.

TEXT BOOKS :

1. Leon Lachman, H.A. Lieberman & J.L.Kanig, Theory & Practice of Industrial Pharmacy, 3rd ed. Varghese Publishg House, Bombay, 1987.

IV Year B.Tech. Biotechnology	I - Semester	L	T	P	To	C
		4	-	-	4	4

BI 413 NEXT GENERATION SEQUENCING & ANALYSIS (ELECTIVE - IV)

Course Description and Objectives :

This course deals with the analysis and interpretation of data obtained using NGS.

Course Outcomes :

1. Students will be able to differentiate general and unique aspect of sequencing methods
2. Students will be able to apply concepts of next generation sequencing (NGS)
3. They will be able to understand NGS data
4. They will be able to analyze NGS data
5. They will be able to utilize various tools available in NGS databases for performing various analyses.

UNIT I - DNA Sequencing :

DNA Sequencing, First generation DNA sequencers, Drawbacks of the first generation sequencing methods.

UNIT II - NGS :

Emergence of Next generation sequencing, 454 Pyro-sequencing, Illumina Genome Analyzer, Applied Biosystems Sequencing, Ion Torrent Sequencing, Polonator Technology, Nanopore Sequencing, Single Molecule Real Time DNA sequencing, Comparison of Next generation sequencing techniques, Drawbacks of NGS, NGS File formats, & applications.

UNIT III - Assembly of Sequence Data :

De novo Genome sequence assembly, Reference sequence assembly, Challenges of Genome assembly, Use of paired – end reads in the assembly, Data Preprocessing methods and sequencing read correction methods, Assembly Errors, Evaluation of assembly methods.

UNIT IV : Applications of NGS :

Transcriptome (RNA) sequencing, Exome sequencing, Genome Annotation, Using NGS to detect sequence variants, ChIP-sequence, Biological theories on ChIPsequence, analysis, Understanding the non – coding genome, Disease gene identification, DNA fragment evaluation, Peak identification, Two condition comparison, Saturation analysis, Motif finding and related theories.

UNIT V : NGS Databases & Analysis of NGS Data :

NGS databases, Sequence Analysis: Pairwise and multiple sequence alignment methods.

TEXTBOOKS :

1. Ali Masoudi-Nejad, Zahra Narimani, Nazanin Hosseinkhan; “Next Generation Sequencing and Sequence Assembly”, Methodologies and Algorithms, Springer; 2013.

BI 415 STRUCTURAL BIOINFORMATICS

Course Description and Objectives :

This course aims to study the strategy and tactics of biophysical concepts of macromolecules and the conformational analysis and forces that determine the protein and nucleic acid structure and ligand interaction with macromolecules. Study of the size and shape of the macro molecule using different techniques using various tools like X-ray Crystallography and NMR is explained in the course.

Course Outcomes :

1. Student will learn the different structural levels of biological macromolecules, its size, shape, their conformations and the forces that are involved in stabilizing these molecules.
2. They will be able to utilize the tools by which this analysis is done will be learned.
3. The student would also learn about the ligand interaction with macromolecules.
4. They will understand the basic principles of various methods of spectroscopy and its applications
5. They will understand the concepts behind X-ray diffraction and X-ray crystallography.

Unit I : Introduction: Levels of structures in Biological macromolecules :

Basic strategies in biophysics- Principles and concepts used in biophysical analysis of life processes - Biomolecules and their interactions, size and shape of macromolecules.

Unit II: Conformational Analysis :

Forces that determine protein and nucleic acid structure, basic problems, polypeptide chains geometries, potential energy calculations, observed values for rotation angles, hydrogen bonding, hydrophobic interactions and ionic interactions, disulphide bonds.

Unit III : Structural Analysis of Macromolecules :

Prediction of proteins structure, nucleic acids, general characteristics of nucleic acid structure, geometries, glycosidic bond rotational isomers and those puckering backbone rotational isomers and ribose puckering forces stabilising ordered forms, base pairing, base stacking tertiary structure of nucleic acids.

Unit IV : Spectroscopy and methods of visualization :

Absorption spectroscopy, Linear and Circular Dichroism, Emission spectroscopy, Nuclear Magnetic Resonance spectroscopy. Methods of direct visualisation, macromolecules as hydrodynamic particles, macromolecular diffusion, ultracentrifugation, viscometry.

Unit V : X-ray diffraction :

X-ray crystallography - X-ray diffraction, determination of molecular structures, electron microscopy, neutron scattering, light scattering.

BI 316 IMMUNOINFORMATICS LABORATORY

Course description and objectives :

This course deals with the basic experiments in immunoinformatics. The main objective of this course is to provide the students adequate skills for understaking miniprojects in immunoinformatics.

Course outcomes:

1. Students will be able perform epitope prediction
2. They will be able to perform target recognition and domain analysis
3. They will be able to predict MHC-I binding sites
4. They will be able to predict MHC-II binding sites
5. They will be able to perform promiscuous regions predictions

LIST OF EXPERIMENTS :

1. Immuno informatics – Epitope prediction
2. Target recognition & Domain analysis
3. MHC-I binding sites predictions using BIMAS for genome polyprotein
4. MHC-I binding sites predictions using BIMAS for domain sequence
5. MHC-I binding sites predictions using SYFPHEITI for genome polyprotein
6. MHC-I binding sites predictions using SYFPHEITI for domain sequence
7. Proteosome cleavage prediction
8. MHC-II binding sites predictions
9. Promiscuous regions predictions
10. Domain modeling using swiss model
11. Sequential epitope prediction using swiss pdb viewer
12. Conformational epitope prediction using swiss pdb viewer

BI 419 R - STATISTICS LABORATORY

Course Description and Objectives :

This course deals with the performance of basic statistical analysis using R-interface. The main objective of this course is to provide training to students to perform basic statistics using R programming.

Course Outcomes:

1. Students will be able to perform Exploratory data analysis
2. They will be able to do sampling from standard discrete and continuous distributions
3. They will be able to use R to illustrate probabilistic notions such as conditioning, convolutions and the law of large numbers.

List of Experiments :

1. Introduction to R.
2. Exploratory data analysis: methods of visualisation and summary statistics.
3. Sampling from standard discrete and continuous distributions (Bernoulli, Geometric, Poisson, Gaussian, Gamma).
4. Generic methods for sampling from univariate distributions
5. The use of R to illustrate probabilistic notions such as conditioning, convolutions and the law of large numbers.
6. Examples of modelling real data (but without formal statistical inference) and the use of visualisations to assess fit.

Test Books:

1. J.Maindonald&J.Braun : Data Analysis and Graphics Using R , Cambridge University Press, Cambridge, 2nd edition, 2007.
2. J.J.Faraway : Linear Models with R ,Chapman& Hall/CRC Texts in Statistical Science.

BI 421 MOLECULAR MODELING LABORATORY

Course Description and Objectives :

This course deals with the modelling of protein structures using software tools. The main objective of this course is to provide hands-on training in modelling proteins.

Course outcomes :

1. Students will be able to perform alignments
2. They will be able to do homology modelling
3. They will gain sufficient insights into the empirical energy field
4. They will be able to perform molecular dynamics

List of Experiments :

1. Comparison/validation alignments.
2. Protein visualization.
3. Homology modelling.
4. Empirical force fields.
5. Molecular dynamics: set up and analysis.
6. Molecular docking.

TEXT BOOK:

MS 402 PRINCIPLES AND PRACTICE OF MANAGEMENT

Course Description & Objectives :

The main object of the course is to explain about concepts, principles and practice of management.

Course Outcomes:

By the end of this course it is expected that the student will be able to:

1. Understand what is management and evolution of management thought
2. Importance of planning and decision making in organizations
3. Process of organizing and delegation of authority
4. Theories of motivation and leadership styles
5. Coordination and control process in the organizations

UNIT - I : Management - Overview:

Definition, nature, purpose and scope of management - Functions and Roles of a manager - an overview of planning, organizing and controlling - Is managing a science or art? Ethics in managing and social responsibility of managers - Evolution of management thought. Contributions made by Taylor, Fayol, Weber, Elton Mayo, Maslow, Herzberg, and McGergor. Various approaches to Management - Decision Theory approach. Systems Approach: Key concepts in systems - Closed system versus open system. Subsystems, System Boundary. McKinsey's 7-S Approach needs - Leadership.

UNIT – II Planning & Decision Making:

Types of plans, steps in planning, and process of planning.Nature of objectives, setting objectives. Concept and process of Managing by Objectives.Nature and purpose of strategies and policies. Strategic planning process. SWOT analysis,Portfolio matrix, premising and forecasting. Decision Making: Meaning, Importance and steps in Decision Making - Traditional approaches to decision-making - Decision making under certainty, programmed decisions – Introduction to decision-making under uncertainty,non-programmed decisions, decision tree- group-aided decisions; Brain storming – Creativity, creative problem solving.

UNIT – III : Organizing :

Concept of organization, process of organizing, bases of Departmentation,Authority & power - concept & distinction. Various types of organization structures -Delegation - concept of delegation; elements of delegation - authority, responsibility, accountability. Reasons for failure of delegation & how to make delegation effective.Decentralization - concept, reasons for decentralization and types (or methods) of decentralization. Span ofManagement - concept, early ideas on span of management.

UNIT – IV : Directing :

Motivation and Motivators: Concept, Theories of Motivation: Hierarchy of Needs, Motivation-Hygiene Expectancy, Equity, Reinforcement, McClelland's needs - Leadership:
Meaning, Definition, Ingredients of Leadership – Trait Approaches of Leadership – Leadership Behavior and Styles – Contingency Approaches to Leadership – Communication: Meaning, Process, and Importance in Functions of Organization – Barriers in Communication – Effective Communication

UNIT – V : Coordination and Control:

Concept and importance of coordination; factors which make coordination difficult; techniques or methods to ensure effective coordination. Control: Concept, planning-control relationship, process of control - setting objectives, establishing standards, measuring performance, correcting deviations. Human response to control. Dimensions or Types of Control: Feed forward control, Concurrent Control (Real TimeInformation & Control), Feedback Control - Techniques of Control: Brief review of Traditional and Modern Techniques of Control.

Text Books:

IV Year B.Tech. Bioinformatics II - Semester

L	T	P	To	C
4	-	-	4	4

BI 402 ECO INFORMATICS AND PREDICTIVE ECOLOGY (ELECTIVE-V)

Course Description and Objectives:

This course links the concepts of fuzzy logic and artificial neural networks for ecological applications. The main objective of this course is to provide insights into the design and application genetic algorithms in ecology and also enabling the students to utilize the knowledge of evolutionary computation in prediction and elucidation of Stream Ecosystems in Prediction and Elucidation of Stream Ecosystems

Course Outcomes :

1. Students will be able to perform Fuzzy knowledge based modeling
2. They will able to perform the designing of genetic algorithms
3. They will able to predict the future of ecosystems
4. They will able to incorporate the scope of utilizing adaptive agents in ecological studies
5. They will able to conduct independent study in river ecosystems for river management

Unit I: Ecological Applications of Fuzzy Logic and unsupervised artificial neural networks :

Fuzzy Sets and Fuzzy Logic, Fuzzy Approach to Ecological Modelling and Data Analysis, Fuzzy Classification, Fuzzy Regionalisation, Fuzzy Knowledge-Based Modelling, Computation of Self organizing Map with an abundant Datasets: SOM algorithm, Utilization of Self organizing Map

Unit II: Ecological Applications of Genetic Aigorithms :

Ecology and Ecological Modelling, Genetic Algorithm Design Details, Applications of Genetic Algorithms to Ecological Modelling, Predicting the Future with Genetic Algorithms, The Next Generation: Hybrids Genetic Algorithms.

Unit III: Ecological Applications of Evolutionary Computation

The Challenges of Ecological Modelling, The Basic Evolutionary Algorithm, Equation Discovery, Optimisation of Difference Equations, Evolving Differential Equations, Rule Discovery, Modelling Individual and Cooperative Behaviour, Predator-Prey Algorithms, Modelling Hierarchical Ecosystems.

Unit IV: Ecological Applications of Adaptive Agents :

Adaptive Agents Framework, Individual-Based Adaptive Agents, State Variable-Based Adaptive Agents (Explain the concept using Algal Species Simulation by Adaptive Agents: Embodiment of Evolutionary Computation in Agents, Adaptive Agents Bank, Pelagic Food Web Simulation by Adaptive Agents).

Unit V: Prediction and Elucidation of Stream Ecosystems :

Study Sites, Data Sources and Modelling Techniques (Explain with an example of any river basin), Classification Trees: Model Development and Validation, Application of Predictive Classification Trees for River management, Artificial Neural Networks: Model Development and Validation, Application of Predictive Artificial Neural Networks for River Management, Prediction of environmental standards.

BI 316 COMPUTATIONAL EPIGENETICS

Course Description and Objectives :

This course deals with the the basic concepts and principles of Epigenetics. This course will Provide basic knowledge to the students about the mechanisms that form the basis of Epigenetics.

Course Outcomes :

1. Student will be able to utilize the concepts of mammalian epigenetics in comparative genomics
2. They will be able to understand the role of istone modifications in DNA repair
3. They will be able to utilize epigenetic databases for retrival of epigenetic data
4. They will be able to utilize computational epigenetic tools
5. They will be able to perform computational analysis of histone modification.

Unit I: **Epigenetics: New Science of Genetics :**

The basics of DNA methylation and histone modification, Epigenetic technology, Model organisms of epigenetics, Functions of epigenetics, Epigenetics and human diseases.

Unit II : **Mechanisms of DNA Methylation, Methyl-CpG Recognition, and Demethylation in Mammals :**

Mammalian DNA MTases, Dnmt3L as a regulatory factor for *de novo* DNA methylation, Base flipping mechanism, UHRF1-histone interactions, Replication-coupled crosstalk between DNA methylation and histone modifications.

Unit III: **Mechanisms of Histone Modifications :**

Histone modifications: Proline Isomerization, Sumoylation, Ubiquitination, ADP-ribosylation, Phosphorylation. Role of histone phosphorylation in transcription regulation, Role of histone phosphorylation in DNA repair. Methylation, Role of histone methylation in transcription regulation. Acetylation, Role of histone acetylation in transcription regulation, Role of histone acetylation in DNA repair.

Unit IV : **Epigenetic Technology :**

Analysis of Gene-specific DNA Methylation, Methods for Assessing Genome-wide DNA Methylation, Methylation of Lysine 9 of Histone H3: Role of Heterochromatin Modulation and Tumorigenesis, Chromatin Modifications Distinguish Genomic Features and Physical Organization of the Nucleus.

Unit V : Computational Epigenetics :

Introduction to epigenetic databases, Computational tools for Epigenetic research, Computational analysis of DNA methylation, Computational analysis of histone modifications, Cancer informatics, Stem cell informatics

Text Books :

1. Handbook of Epigenetics by Trygve Tollefsbol, 2006
2. Epigenetics by Danny Reinberg, 2010

BI 406 METABOLIC ENGINEERING (ELECTIVE - V)

Course Description and Objectives :

This course deals with the basic and applications of metabolic engineering. This course helps the student for understanding purposeful modification of metabolic pathways to achieve desired goals such as enhanced production of metabolites, creation of novel metabolites and utilization of new carbon substrates

UNIT I : Introduction & Applications of Metabolic Engineering :

Identification of metabolic regulation is a key point in metabolic engineering. Basic concepts of Metabolic Engineering – Overview of cellular metabolism – Different models for cellular reactions, induction – Jacob Monod model and its regulation, Differential regulation by isoenzymes, Feed back regulation. Application in pharmaceuticals, chemical bioprocess, food technology, agriculture, environmental bioremediation and biomass conversion.

UNIT II : Synthesis of Primary & Secondary Metabolities :

Amino acid synthesis pathways and its regulation at enzyme level and whole cell level, Alteration of feed back regulation, Limiting accumulation of endproducts. Regulation of secondary metabolite pathways, precursor effects, prophase, idiophase relationship, Catabolite regulation by passing control of secondary metabolism, producers of secondary metabolites, applications of secondary metabolites.

UNIT III : Bioconversions & Regulation of Enzyme Production :

Applications of Bioconversions, Factors affecting bioconversions, Specificity, Yields, Co metabolism, Product inhibition, mixed or sequential bioconversions, Conversion of insoluble substances. Strain selection, Genetic improvement of strains, Gene dosage, metabolic pathway manipulations to improve fermentation, Feed back repression, Catabolite Repression, optimization and control of metabolic activities. The modification of existing - or the introduction of entirely new - metabolic pathways.

UNIT IV : Metabolic Flux :

Integration of anabolism and catabolism, metabolic flux distribution analysisbioprocess, material balance, kinetic types, equilibrium reaction. Experimental determination method of flux distribution, Metabolic flux analysis and its applications, Thermodynamics of cellular processes.

UNIT V : Metabolic Engineering with Bioinformatoics :

Metabolic pathway modeling, Analysis of metabolic control and the structure metabolic networks, Metabolic pathway synthesis algorithms.

BI 408 MOLECULAR FORENSICS (ELECTIVE-VI)

Course Description and Objectives:

This course deals with the basic concepts of DNA forensics and various tools employed. The main objective of this course is to provide gain adequate knowledge in various types of PCR and techniques in DNA forensics.

Course Outcomes:

1. Students will be to choose the proper PCR method and technique for molecular forensic analysis
2. They will be able to demonstrate the process of paternity testing
3. They will be able to interpret DNA typing results
4. They will be familiarized with various legal perspectives of permissibility of DNA testing
5. They will be able to use various population databases of DNA markers.

Unit I: Introduction to Bioinformatics :

Bioinformatics: Introduction, Theory and practice of database searching, Integrated information retrieval, Internet access, Searching for sequence homology and alignment. Basic concepts of UNIX database and programming, Computing concepts of the UNIX operating system. Patent laws and Intellectual rights.

Unit II: Introduction to DNA forensics and types of PCR :

Introduction to DNA forensics, Scope and application of DNA forensics in animal and human criminal investigations in variety of situations. Types of PCR: Nested PCR, Touchdown PCR, Gradient, PCR, Hot-starts PCR, Quantitative PCR, multiplex PCR. DNA quantification by Slot- blot assay, Pico-green micro-titer plate assay, AluQuant human DNA quantification system, endpoint PCR, PCR inhibitors & solutions, Contamination Issues, etc.

UNIT III: Techniques in DNA forensics :

Uni-parentally inherited genetic markers in ethnic and geographical origin detection, DNA Profiling Kits (Easy DNA, Pro-filer, etc.) DNA fingerprinting of degraded samples, Slot-blot assay for quantification of DNA, DNA-DNA Hybridization, SNP microarray for supplementary paternity testing. Genetic analysis of chromosome X (pentaplex/heptaplex PCR assay), multicopy Y-STR analysis, mitochondrial DNA analysis, DNA multi-reverse parental analysis, cytochrome b analysis, eDNA Personal Effects and DNA analysis(sources and problems)

UNIT IV: Forensic DNA evidence interpretation :

Advantages, disadvantages and limitations of DNA forensics. Interpretation of DNA typing results: Complicating Factors (Multiple contributors, degradation, and extraneous substances), System-specific Interpretational Issues (RFLP, PCR systems). Assessing strength of evidence: Determination of Genetic Concordance, Evaluation of Results, Frequency Estimate Calculations, Population Substructure, Likelihood Ratios, and Uniqueness of DNA Profile.

UNIT V: DNA Fingerprinting Applications :

Case studies in disputed paternity cases, child swapping, missing person's identity, civil immigration, veterinary, wild life and agriculture cases ;Legal perspectives – legal standards for admissibility of DNA profiling – procedural & ethical concerns, status of development of DNA profiling in India & abroad; Limitations of DNA profiling; Population databases of DNA markers –STRs, Mini STRs, SNPs. Uses of STR Typing, New & future technologies: Microarrays technology, Synthetic DNA, analysis of Degraded DNA, Low Copy Number DNA, MALDI-ToF, Mass Spectrometry.

BI 410 COMPARATIVE GENOMICS (ELECTIVE-VI)

Course Description and Objectives:

This course deals with genomes of various organisms and their comparisons. The main objective of this course is to find genomic information and resources also to provide students adequate knowledge in annotating genes

Course Outcomes :

1. Student will be able to understand the basic concepts of Comparative genomics
2. Student will be acquire adequate insights into the human genome project
3. Student will be learn the utility of phylogenetic trees in evolutionary thinking
4. Student will be understand the fundamentals of bacterial and vertebrate evolution

Unit I: Introduction to comparative genomics :

What is “comparative genomics”?. Timeline of comparative genomics developments. Databases for genomics resources: NCBI. The history of the Human Genome Project. Why, when, who and how. Why sequence the human genome?. Ethical and societal issues: Iceland’s Genomic Database as a case study

Unit II: Obtaining and Assembling Sequences :

Hierarchical shotgun sequencing, Large-scale sequencing methods: cloning and BAC library creation, Sequence quality scoring, vector screening (phred), Sequence assembly into contigs and skeleton frameworks (phrap), Introduction to evolutionary thinking: Phylogenetic analyses: tree terminology and parsimony, Concept of homology

Unit III: Gene Identification and Annotation :

Sequence alignment: global versus local Databases and tools for annotating sequence (FASTA, BLAST) Modifying search strategies; searching different databases, Inferring gene function from relatedness to other genes, Finding Open Reading Frames (ORFs) distinguishing introns from diverged exons.

Unit IV: Genome Comparisons I: Organelles :

Phylogenetic analyses: introduction to programs, Mitochondrial Genomes: size, content, and gene order, The minimal genome, Survey of bacterial genomes.

Unit V : Genome Comparisons II: Bacteria and Vertebrates :

Microbial genes in the human genome: lateral transfer or gene loss?. Phylogenetic analyses to determine relationships and interpret character evolution in Bacteria. Vertebrate evolution based on genome comparisons. Human and chimpanzee genome comparisons.

BT409 BIOSENSORS & BIOELECTRONICS (ELECTIVE - IV)

Course Descriptions and Objectives:

This course deals with the basics and applications of Biosensors. This course helps to understand the use of biomolecues as recognition elements for detection of a particular analyte and the use of biological elements such as proteins in place of silicon chips.

Course Outcomes:

1. Students will be able to understand various transducers and their applications
2. They will be able to develop low cost biosensors for various purposes
3. They will understand the design and applications of enzyme electrodes
4. They will understand the potential advantages of a biocomputer
5. They will understand the basics of bimolecular photonic computer

Unit I: Introduction:

Biosensors- Advantages and limitations, various components of biosensors Biocatalysis based biosensors, Bioaffinity based biosensors & Microorganisms based biosensors, Biologically active material and analyte. Types of membranes used in biosensor constructions.

Unit II: Transducers In Biosensors:

Various types of transducers; principles and applications - Calorimetric, Optical, Potentiometric / Amperometric, Conductometric / Resistometric, Piezoelectric, Semiconductor, Impedimetric, Chemiluminiscene - based Biosensors.

Unit III: Application And Uses of Biosensors:

Biosensors in clinical chemistry, medicine and health care, biosensors for veterinary, agriculture and food Low cost - biosensor for industrial processes for online monitoring; biosensors for environmental monitoring. Application of enzymes in analysis; design of enzyme electrodes and their application as biosensors in industry, healthcare, food and environment.

Unit IV: Bioelectronics :

Potential advantages & Developments towards a biomolecular computer, development of molecular arrays as memory stores; molecular wires and switches; mechanisms of unit assembly.

Unit V: Design for A Biomolecular Photonic Computer:

Assembly of photonic biomolecular memory store; Information processing; commercial prospects for biomolecular computing systems.

I SEM AND II SEM

16HS101 BASIC MATHEMATICS - I

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

In this course the fundamental concepts of mathematics are introduced. A treatise of Matlab is also introduced in the practical session.

The objective of the course is to impart knowlege on progressions, partial fractions and binomial theorem. This course also deals with elementary concepts in geometry, trigonometry, differential and integral calculus. Numerical methods are also introduced for finding approximate solutions of algebraic equations. Besides, interpolation techniques and MATLAB environment are emphasized.

Course Outcomes:

The student will be able to:

- apply arithmetic and geometric progressions.
- understand coordinate geometry and different forms of straight lines.
- use basic concepts of trigonometric ratios and identities.
- understand the concept of limit, continuity and differentiability.
- familiar with basic concepts of integration.
- find roots of algebraic and transcendental equations.
- apply some interpolation techniques.
- use some commands of Matlab for mathematical computations.

SKILLS:

✓ *Compute sum of terms of given progression.*

✓ *Differentiate the given function.*

✓ *Evaluate the integral of given function.*

✓ *Interpret interpolation techniques to estimate the functional values.*

ACTIVITIES:

- *Compute the derivative and compare with Matlab output.*
- *Evaluate the integral and compare with Matlab output.*
- *Interpet the given data and estimate the functional values at a given point.*

UNIT - 1 **L-9, T-3**

MATHEMATICAL PRELIMINARIES: Progressions, partial fractions and binomial theorem.

UNIT - 2 **L-9, T-3**

TRIGONOMETRY AND GEOMETRY: Coordinate system, straight line, trigonometric functions and trigonometric identities.

UNIT - 3 **L-9, T-3**

DIFFERENTIAL CALCULUS : Limits, continuity and differentiability.

UNIT - 4 **L-9, T-3**

INTEGRAL CALCULUS: Concepts of integration - rules, integration by parts, integration by partial fractions and integration by inspection (standard forms).

UNIT - 5 **L-9, T-3**

NUMERICAL METHODS: Bisection method, Newton-Raphson method, finite differences, forward and backward difference tables, interpolation by Lagrange's method, Newton's forward and backward methods, Gauss forward and backward methods.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Introduction to MATLAB environment.

Basic mathematical operations using MATLAB.

1. Solving simple expressions.
2. Trigonometric function values.
3. Limits.
4. Continuity.

16HS102 ENGINEERING PHYSICS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	45	30	10	-	10

Course Description and Objectives:

Technology is the experimental information for the physicist, where the theories can be tested. Recent technical developments have been the results of collaboration of physicists and engineers.

Study of engineering physics is a unique opportunity to learn the fundamental concepts of physics and apply this knowledge to both scientific and engineering problems.

The present course deals with various fields such as lasers, optical fibres, photonics, nano and funcational materials, make the students to enrich basic knowledge in various fields of physics and apply the same in engineering fields.

Course Outcomes:

The student will be able to :

- understand the applications of ultrasonics and to calculate the velocity of ultrasonic waves in liquids.
- acquire basic knowledge in non-destructive techniques.
- understand basic concepts of laser and optical fibre which help in designing and developing new devices in emerging fields.
- grasp the basics of quantum mechanics.
- understand the fabrication of solar devices.
- use nanoscience and technology for innovative and compact design.
- demonstrate synthesis, properties and applications of nanomaterials and functional materials.

SKILLS:

✓ *Determine the velocity of ultrasonics in a given liquid using interferometer.*

✓ *Study the wavelengths of light sources and lasers.*

✓ *Estimate the efficiency of a given solar cell.*

✓ *Learn about the type of the optical fibre and their ability to propagate light waves from its numerical aperture.*

✓ *Know voltage – current characteristics of a given light emitting diode.*

UNIT - 1 **L-9**

ULTRASONICS : Introduction – production of ultrasonic waves, piezoelectric method, properties of ultrasonic waves, types of ultrasonic waves, determination of velocity of ultrasonic waves in solids and liquids; SONAR - medical applications.

NDT: Introduction- types, visual inspection and liquid penetrate testing; Ultrasonic testing systems; X - ray radiography.

UNIT - 2 **L-9**

LASERS : Characteristics of laser light – spontaneous and stimulated emission of radiation, He-Ne laser, CO_2 laser, semiconductor laser and applications.

HOLOGRAPHY: Holography and applications.

FIBER OPTICS : Principle of optical fibre – acceptance angle, numerical aperture, types of fibres, dispersion and attenuation in optical fibres, optical fibre communication system and fibre optic sensors.

UNIT - 3 **L-9**

QUANTUM MECHANICS : Introduction- matter waves, Schroedinger's time independent wave equation, physical significance of the wave function, particle in one dimensional potential well and tunneling phenomenon.

FREE ELECTRON THEORY OF METALS : Introduction – classical free electron theory, electrical conductivity of metal, quantum free electron theory, Fermi - Dirac distribution function and its variation with temperature

PARTICLE ACCELERATORS: Introduction- cyclotron, synchrocyclotron, betatron and applications.

UNIT - 4 **L-9**

SOLAR ENERGY: Solar radiation, photovoltaic effect, solar cells, efficiency of solar cell and solar thermal energy conversion systems.

PHOTONICS: LED, LCD, photo conducting materials, photo detectors, photonic crystals, non- linear optical behaviour of materials and applications.

UNIT - 5 **L-9**

NANO MATERIALS: Introduction, fabrication of nano materials, ball milling, sol-gel, physical and chemical properties of nano materials and applications.

FUNCTIONAL MATERIALS: Smart materials, shape memory alloys, chromic materials (thermo, photo and electro), metallic glasses, advanced ceramics, composites, fiber reinforced plastics/ metals and biomaterials.

TEXT BOOKS:

1. V. Rajendran, "Engineering Physics", 7th edition, TMH Publications, 2014
2. D. K. Bhattacharya and P. Tandon, "Engineering Physics", Oxford University Press, 2015.

REFERENCE BOOKS :

1. M. R. Srinivasan, "Engineering Physics", 1st edition, New Age International Publishers, 2008.
2. M. N. Avadhanulu and P.G. Kshirsagar, "Engineering Physics", 1st edition, S. Chand and Company Ltd, 1992.
3. S. P. Sukhatme, "Solar Energy", 2nd edition, TMH Publication, 2005.
4. Arumugam, "Materials Science", 3rd edition, Anuradha Publications, 2002.

ACTIVITIES:

- *Estimate acoustic impedance of a given material.*
- *Measurement of distances using ultrasonic range finder.*
- *Study of linear density of yarn/ fibre using Melde's experiment.*
- *Determination of refractive index of a given liquid using laser.*
- *Find height of a room using laser.*
- *Identify the type of semi-conductor using Hall effect.*
- *Study of numerical aperture of optical fibres made of different materials.*
- *Design of solar panel to obtain required voltage.*
- *Evaluate thermal conductivity of materials.*
- *Measure temperature using thermo couple.*

16HS105 TECHNICAL ENGLISH COMMUNICATION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	15	5	6	4	5

Course Description and Objectives :

To introduce students the specific use of English for the purpose of Technical Communication that would strengthen their skills in the areas of writing and speaking and thereby enable them to function effectively in their professional sphere. The teaching efforts in this course will be directed towards making students develop their technical writing skills in particular and overall language proficiency in general. It will be done by making students peruse good samples of technical writing covering a wide range of contemporary issues relevant to the engineering profession. Students will, also be revisiting, the fundamentals of grammar to get trained on use of standard English.

Course Outcomes:

The student will be able to :

- acquire an understanding of the rules of grammar.
- strengthen their reading and listening comprehension skills to follow the academic discourse in the engineering classroom.
- have a command of basic vocabulary related to different subject areas.
- have a grasp on the mechanics of writing and express their ideas through construction of simple texts.
- attain language proficiency to participate in the classroom discussions.

SKILLS:

✓ *Apply different sub skills like skimming, scanning, reading for information, reading for inference etc to understand different kinds of text.*

✓ *Apply different sub skills like top down, bottoms up approaches to listening, and understand phonetic and phonological features of the English language to deconstruct long spoken discourses.*

✓ *Use functional vocabulary relevant to subject areas like environment, tourism, engineering, technology and media to express ideas lucidly.*

✓ *Use appropriate sentence structure, cohesive devices and diction to construct simple text in writing and regular correspondence like e-mails, letters etc.*

✓ *Capture and understand key points during class room discourses through applying sub skills of writing like note-making, paraphrasing and summarizing.*

UNIT - 1 **L-9**

- Text : **Environmental consciousness**
  (Climate change, green cover, pollution, renewable vs. non renewable energy sources (from energy unit)
- Grammar : Articles, prepositions, sentence types and construction
- Vocabulary : Root, prefixes and suffixes
- Composition : Paragraph writing (descriptive and narrative)
- Laboratory Practice : Introduction to phonetics (Organs of speech- consonants, vowels and diphthongs; Syllable, stress and intonation)

UNIT - 2 **L-9**

- Text : **Emerging technologies**
  (Solar power, cloud computing, nanotechnology, wind energy (to be covered from energy unit)
- Grammar : Time and tense (Present, past and future; Helping verbs; Modals)
- Vocabulary : Synonyms and antonyms
- Composition : Letter writing (Informal)
- Laboratory Practice : Grammar practice (Speaking of past, present and future)

UNIT - 3 **L-9**

- Text : **Travel and tourism**
  (Advantages and disadvantages of travel, tourism, *atithi devo bhava*- Tourism in India)
- Grammar : Subject-Verb agreement and sentence construction
- Vocabulary : Idioms and Phrases
- Composition : Letter writing (Formal)
- Laboratory Practice : Situational conversations – Role plays (Introducing, greeting, enquiring, informing, requesting and inviting)

UNIT - 4 **L-9**

- Text : **Engineering Ethics**
  (Challenger disaster, biotechnology, genetic engineering, protection from natural calamities, how pertinent is the nuclear option? An environment of energy (from energy unit)) Avoiding sexist language (Gender sensitization)
- Grammar : Sentence transformation (Degrees, voice, speech and synthesis)
- Vocabulary : Phrasal verbs
- Composition : Note-making on Nandan Nilekani's "In search of our energy solutions" (from energy unit) Summarizing on "Flight from conversation" (New York Times)
- Laboratory Practice : Situational conversations – Role plays (Emotions, directions, descriptions, agreements, refusals and suggestions).

ACTIVITIES:

- *Doing phonetic transcription of selected words from the list provided using talking dictionaries of AHD and CALD.*
- *Complete graded grammar exercises in Rosetta Stone.*
- *Complete graded listening and reading comprehension exercises in Rosetta Stone.*
- *Watch TED videos and making notes.*
- *Watch TED videos to paraphrase and summarize.*
- *Ad- making.*
- *Prepare brochure.*
- *Dialogue writing followed by role play.*
- *Poster designing.*
- *Team presentation with PPTs and group discussion.*

UNIT - 5 **L-9**

- Text : **Media matters:** (History of media, language and media, milestones in media, manipulation by media, thousands march against nuclear power in Tokyo (from energy unit), entertainment media and interviews)
- Grammar : Common errors
- Vocabulary : One-word substitutes
- Composition : E-mail, short message service (SMS), writing advertisements, reporting; Social Media- blogging, facebook, twitter (acceptable and non acceptable content)
- Laboratory Practice : Group discussions (topics from energy unit) – Dumping of nuclear wastes, exploration of eco-friendly energy options, lifting of subsidies on petrol, diesel, LPG etc)

TEXT BOOK:

1 "Mindscapes - English for Technologists and Engineers", Orient Black Swan, 2012.

16CS101 BASICS OF COMPUTERS AND INTERNET

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course provides students with a working knowledge of the terminology, processes and components associated with computers and internet. Students will get exposure to building blocks of computers, operating systems, application software, networking, internet, world wide web, security, maintenance, information systems and the application development processes.

Course Outcomes:

The student will be able to :

- understand the terms and concepts of computer science and information technology (hardware, software, networking, security, internet/web and technologies).
- use the products and services of computers.
- use internet/web services as a resource for developing shared applications.
- install different operating systems and application software.

SKILLS:

- ✓ *Assemble and disassemble the personal computer system.*
- ✓ *Install different desktop operating systems.*
- ✓ *Use the basic text processing, simple data analysis and data presentation tools.*
- ✓ *Configure network parameters.*
- ✓ *Secure the personal computer and information from various external threats.*

ACTIVITIES:

- *Prepare a report on various generations of computers and their peripherals.*
- *Disassemble and assemble of a personal computer system.*
- *Install the Linux operating system and other software required in a personal computer system.*
- *Connect the system to an ethernet and configure the same.*
- *Prepare an MS word document.*
- *Prepare a spread sheet with various mathematical operations, charts, sorting etc.*
- *Make a report on power point presentation for the given topic.*

UNIT - 1 **L-10**

COMPUTING SYSTEMS : Introduction to computer, computers for individuals, importance of computers, parts of computer system, memory devices, input and out devices, types of monitors, types of printers, number systems, bits and bytes, text codes and types of processors.

UNIT - 2 **L-10**

OPERATING SYSTEMS : Types of operating systems, user interfaces, PC operating systems, network operating systems, types of software, programming languages, compiler and interpreter, program control flow and algorithm.

UNIT - 3 **L-8**

NETWORKS AND DATABASES : Networking basics, uses of network, types of networks, network hardware, introduction to data bases and database management systems.

UNIT - 4 **L-8**

INTERNET AND WWW : Internet's services, world wide web, browser setups, using search engine, email and other internet applications.

UNIT - 5 **L-9**

CYBER SECURITY : The need of computer security, basic security concepts, threats of users, online spying tools, threats to data, cybercrime and protective measures.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- know the usage of the computer systems.
- setup the IDEs for the computer programming languages.
- get exposure on office automation tools like Microsoft Word, Excel, and power point.
- identify the different computer system and data threats and also protect them by installing antivirus software.

LIST OF EXPERIMENTS Total hours: 30

1. Demonstrate the personal computer peripherals and get a report on each peripheral.
2. Demonstrate the personal computer assembling procedure and do the same.
3. Install wide varieties of free and open source operating systems.
4. Demonstrate network interface card (NIC) configuration and any internet browsers options setup.
5. Demonstrate the Java development kit (JDK) installation and environmental variable (PATH) setup.
6. Demonstrate the following experiments using Office automation tools
   a. Text formatting and table.
   b. Mathematical equations.
   c. Watermarking using analysis tool.
   d. Calculate student mark details.
   e. Create four types of charts.
   f. Import external data, sort and filter using powerpoint tool.
   g. Create text and images with effects.
   h. Create animation and sound effects.
7. Demonstrate the installation of anti-virus software to detect different types of virus programs.

TEXT BOOK :

1. P. Norton, “Introduction to Computers”, 7th edition, Tata-McGraw Hill, 2010.

REFERENCE BOOKS:

1. ITL Education Solution Limited, “Introduction to Computer Science”, 2nd edition, Pearson Education, 2011.
2. E. Maiwald, “Fundamentals of Network Security”, 3rd edition, Tata-McGraw Hill, 2004.

16CS102 COMPUTER PROGRAMMING

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	5

Course Description and Objectives:

This course is aimed at offering fundamental concepts of programming language to the students. It starts with the basics of C-programming and deals with the structure and various attributes required for writing a 'C' program. It also introduces various operators and control statements used in programming. Then it switches to functions and arrays. It goes on with strings, pointers, files and the user defined data types. As a first-level course in computer science, it forms the basis to understand usage of various attributes in writing a program.

Course Outcomes:

The student will be able to :

- understand the basic terminology used in computer programming to write, compile and debug programs in 'C' language.
- use different data types to design programs involving decisions, loops and functions.
- understand the allocation and usage of dynamic memory.
- understand the usage of files and structures.

SKILLS:

✓ *Identify suitable data types for an application.*

✓ *Apply control statements for decision making problems.*

✓ *Use multidimension array for matrix application.*

✓ *Design a program to calculate average of a class.*

✓ *Analyze the difference between static and dynamic memory allocation.*

UNIT - 1 **L-9, T-3**

INTRODUCTION TO C PROGRAMMING : Structure of C program- comments, processor statement, function header statement, variable declaration statement and executable statement; C character set - constants, identifiers, operators, punctuations, keywords, modifiers, identifiers, variables, c scopes, basic data types, type qualifiers, storage classes, reading and writing characters and formatted I/O.

UNIT - 2 **L-9, T-3**

OPERATORS AND CONTROL STATEMENTS : Operators- assignment, arithmetic, relational, logical, bitwise, ternary, address, indirection, size of, dot, arrow and parentheses operators; Expressions precedence of operators and associative rules; Control statements- category of statements, selection, iteration, jump, label, expression and block.

UNIT - 3 **L-9, T-3**

FUNCTIONS AND ARRAYS : Function- declaration, prototype, definition, calling by value and call by address, standard library functions and recursive functions; Array- declaration, initialization, reading, writing, accessing and passing as a parameter to functions, 2D-arrays and multidimensional arrays.

UNIT - 4 **L-9, T-3**

STRINGS AND POINTERS : Strings- declaration, string library functions, array of strings and command line arguments; Pointers- declaration, initializing pointers, multiple indirection, relationship between arrays and pointers; Scaling up- array of arrays, array of pointers, pointer to a pointer, pointer to an array; pointer to functions and dynamic memory allocation functions.

UNIT - 5 **L-9, T-3**

STRUCTURES AND FILES : Structures - declaration, initialization and accessing, array of structures and passing structures to functions, structure pointers, arrays and structures within structures, unions, bit-fields, types and enumerations; Files - I/O and processing operations on text and binary files; Pre-processor directives.

LABORATORY EXPERIMENTS

Course Outcomes:

Upon successful completion of this course, the student will be able to:

- write, compile and debug programs in C language.
- formulate problems and implement algorithms in C.
- choose programming components that efficiently solve computing problems in real-world.

LIST OF EXPERIMENTS Total hours: 30

1. Compute the factors of a number.
2. Compute the average of ‘n’ numbers.
3. Find whether a number is palindrome or not.
4. Find whether a number is a power of 2 or not.
5. Compute the factorial of a number.
6. Implement any kind of operation (+,-,*,/,%) using a switch case.

ACTIVITIES:

- *Implement matrix operations.*
- *Implement malloc and calloc functions.*
- *Copy the content of one file into the other.*
- *Implement string manipulations functions.*

7. Swap two values useing call by value and call by reference.
8. Using structure of arrays.
9. Find the reversal of a number.
10. Find the frequency of each number in the array.
11. Which takes 0's and 1's as input and the array should consist of all 0's first and then 1's.
12. Copy the first 10 words of a file into the other file.
13. Count the number of words in a file.
14. Create a structure which stores the student's information in a class.
15. Reverse the contents of the array.
16. Implement pointer of pointers.
17. Give n^{th} term of the Fibonacci number.
18. Find the factorial of a number using recursion.
19. Find the number of vowels in a file.
20. Access the structure and union members.

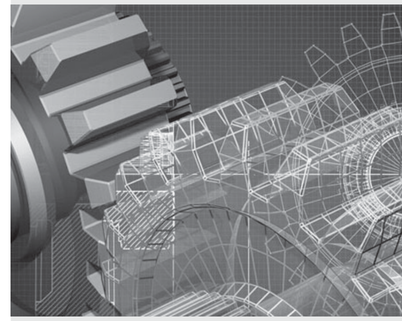
TEXT BOOK:

1. A. Mittal, "Programming in C - A Practical Approach", Pearson Education, India, 2015

REFERENCE BOOKS:

1. R. Thareja, "Introduction to C Programming", 2nd edition, Oxford University Press India, 2015.
2. C. H. Schildt, "The Complete Reference", 4th edition, Tata McGraw-Hill, 2000.
3. E. Balagurusamy, "Programming in ANSI C", 4th edition, Tata McGraw-Hill, 2008.

16EE101 BASICS OF ENGINEERING PRODUCTS



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course enables the students to understand the basics of civil, mechanical, electrical and electronics systems and components used in day-to-day life. It deals with construction materials, power generation principles and working of a few commonly used household appliances. Besides, the student will be able to identify/appreciate various concepts, service and maintainance of engineering products.

Course Outcomes:

The student will be able to:

- gain knowledge and hands-on experience on various engineering products.
- install, operate, maintain and troubleshoot basic mechanical, electrical and electronic appliances.
- understand the concept of conservation of energy.
- gain awareness on choosing appropriate construction materials.

SKILLS:

✓ *Identify UPS requirements for a given load.*

✓ *Provide a lighting scheme for specific working environment.*

✓ *Design a composition of hHeating element for a particular application.*

✓ *Troubleshoot issues relating to immersion heater and induction heater.*

✓ *Provide an earthing for domestic outlet.*

✓ *Select, configure and maintain a few engineering appliances such as TV, radio, telephone, mobile phone, wifi router, micro oven, PA system, etc.*

ACTIVITIES:

- *Trouble shooting of immersion heater and induction heaters.*
- *Disassemble and Assemble of Domestic Appliances such as Mixer Grinder, Fan etc.,*
- *Provide Earthing for Domestic Outlet.*
- *Design Electric Wiring system for a prototype house.*
- *Design UPS for a defined load.*
- *Practice assembly of a FM radio.*
- *Configure a Wifi Router for required number of users.*

UNIT - 1 **L-9**

WORKING PRINCIPLE OF AC, REFRIGERATOR, PUMPS, IC ENGINES AND SCREW JACK: Working principle of air-conditioner and refrigerator- components, assembly and disassembly, working principle of centrifugal and reciprocating pumps; Types, parts and applications, working principle of screw jack and its components; Working principle of IC engines- 2 stroke and 4 stroke.

UNIT - 2 **L-10**

BRICKS : General, qualities and classification of bricks; Tests for bricks; Size and weight of bricks; Timber- definition, qualities of good timber, decay of timber and advantages of timber in construction.

CEMENTS : Types and composition of cement, setting of cement, tests for physical properties of cement, and different grades of cement.

AGGREGATES : Classification of aggregates, source, size and shape of aggregates; Tests for aggregates.

STEEL: Types of steel, physical properties and mechanical properties of steel. Simple layout design, paints, tiles, fittings, ventilation, furniture and green house aspects.

UNIT - 3 **L-8**

ELECTRIC ENERGY SYSTEMS : Overview of power system structure; Conventional and non conventional generations - types of turbines, generators, substations, towers, earthing procedure, protection schemes, single phase and three phase systems. Methods of electrical wiring systems - wiring procedure and calculations; Wiring methods. Uninterruptible power supply (UPS)- components in UPS, its functionality and calculation of ratings for UPS components to a specific load.

UNIT - 4 **L-10**

LIGHT : Light energy, evolution of light sources, working of incandescent, fluorescent, MV, SV and LED lamps, comparison and applications.

HEAT : Heat energy, modes of heat transfer, resistance and induction heating, comparison and applications.

MOTOR : Electric motors, classification, construction and working principles of motors used in domestic applications, mixer grinder, ceiling and exhaust fan, hair dryer, washing machine, water pump, air coolers, vacuum cleaner, computer cooling motor and electric bike.

UNIT - 5 **L-8**

HOUSE HOLD ELECTRONIC APPLIANCES: Working principles of television, radio, remote control, telephone, microwave oven, cell phone, PA system, induction stove, wifi router and DTH.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Demonstration of Modelling / functioning / disassembly / assembly / fault rectification / understanding of the following.

1. Air-conditioners and Refrigerators
2. 2 Stroke and 4 Stroke Engines
3. Reciprocating Pumps
4. Power Screw Jack
5. Size and Water absorption capacity of Bricks
6. Initial and final setting time of Cement
7. Toughness value of coarse aggregates
8. Bulking of Sand
9. Earthing Schemes
10. Electric Wiring
11. UPS system
12. Immersion Heater, Induction Heater and Iron Box.
13. Ceiling Fan and Mixer.
14. Television
15 Radio
16. Remote Control
17. Telephone
18. Fax Machine
19. Mobile Phone
20. PA System

TEXT BOOKS:

1. M.S.Shetty, “Concrete Technology”, 1st edition, S.Chand and Co, 2005.

4. Janakaraj, A Sumathi et al, “Electrical engineering - Electrical machines and Appliances Theory”, 1 st edition, Tamilnadu Textbook Corporation, 2011.
5. M. Brain, “How Stuff Works”, 1 st edition, John Wiley and Sons, 2001.
6. P. Kumar, “Basic Mechanical Engineering”, 1 st edition, Pearson Publishers, 2013.

16HS104 ENGLISH PROFICIENCY AND COMMUNICATION SKILLS

Hours Per Week :

L	T	P	C
0	-	2	1

Total Hours :

L	T	P
0	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To equip students with functional English by exposing them to a wide range of language use in different contexts and thereby encourage them to use the language comfortably in real life situations. Students will strengthen their comprehension skills of listening and reading by acquiring adequate vocabulary through perusing authentic materials gathered from news papers, journals and other mass communication media.

Course Outcomes:

The student will be able to :

- use functional English to speak and express themselves in different social contexts
- write simple letters, narratives, factual reports and descriptive passages for both academic and non-academic purposes in English.
- gain proficiency to undergo Preliminary English Test (PET), an Intermediate Level English Certification Test administered by Cambridge English Language Assessment, UK.

SKILLS:

✓ *Use appropriate words in right order for effective sentence formation, and writing short texts.*

✓ *Read and extract information from different texts & draw inferences by understanding elements like tone and transitional words.*

✓ *Understand short and long spoken discourses through analysis of elements like stress and intonation.*

✓ *Articulate clearly thoughts and ideas on simple every day topics.*

UNIT - 1 **P-6**

Functions : Introducing self/others; Expressing needs/feelings/opinions (SWOT Analysis)

Skill Focus:

Reading - Understanding factual information

Writing - Word order and sentence formation

Listening - Decoding for meaning following elements of stress, intonation and accent

Speaking - Articulating syllables clearly, speaking fluently with correct pronunciation

Vocabulary - Discerning to use right word for the given context

Grammar - Spellings, use of nouns, adjectives, verbs, prepositions in the sentence structure

Practice: Objective PET Units 1 - 6

UNIT - 2 **P-6**

Functions : Defining and describing people, places, things and process.

Skill Focus:

Reading - Inferences from sentences and short messages – true/false

Writing - Rewording, sentence transformation and convincing

Listening - Understanding the short messages and conversations

Speaking - Role plays and short conversations

Vocabulary / Grammar – Use of adjectives/adverbs, comparatives and superlatives

Practice : Objective PET Units 7 – 12

UNIT - 3 **P-6**

Functions : Describing spatial and temporal relations; Giving directions/ instructions

Skill Focus :

Reading - Reading between the lines, inferences, true/false

Writing - Developing hints - Writing short messages/paragraphs

Listening - Searching for factual information - Gap filling

Speaking - Snap talks, JAM and elocution

Vocabulary / Grammar - Prepositions, phrasal verbs; PET word list

Practice: Objective PET Units 13 - 18

UNIT - 4 **P-6**

Functions : Narrating, predicting, negotiating and planning

Skill Focus:

Reading - Reading for evaluation and appreciation, comprehension

Writing - Letters – e-mails – 7 C's

Listening - Following long conversations/interviews

ACTIVITIES:

- *SWOT Analysis.*
- *Snap talks.*
- *Spell Bee.*
- *Short conversations.*
- *Role play.*
- *Quiz.*
- *Elocution.*
- *JAM.*
- *Group. Discussion Debate.*
- *Team presentations.*

Speaking	-	Discussions, debate and descriptions
Vocabulary / Grammar	-	Modals, conditionals and verb forms (time and tense)
Practice:		Objective PET Units 19 – 24

UNIT - 5 **P-6**

Functions: Requesting, denying, suggesting and persuading

Skill Focus:

Reading	-	Understanding factual information
Writing	-	Short stories and explanatory paragraphs
Listening	-	Inferences from long speeches/conversations
Speaking	-	Announcements and presentations
Vocabulary / Grammar	-	Punctuation and cloze tests

Practice: Objective PET Units 25 – 30

TEXT BOOK:

1. L. Hashemi and B. Thomas, "Objective PET", Student's Book with Answers, 2nd edition, Cambridge University Press, 2015.

REFERENCE BOOKS :

1. Cambridge Preliminary English Test Without Answers 8.

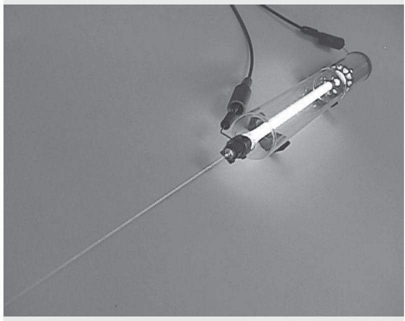
16HS110 ENGINEERING PHYSICS LABORATORY



Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course Description and Objectives:

This lab is intended to make the students realize the theoretical concepts of physics having hands on experience in conducting the following experiments.The students have to perform at least 10 experiments from the list of experiments.

Course Outcomes:

The student will be able to :

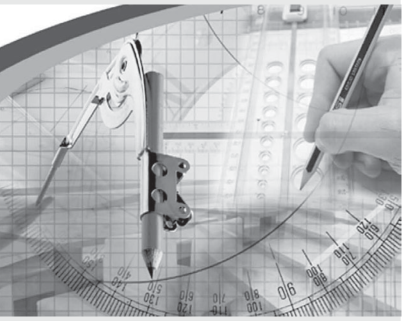
- realize the concept of resonance by conducting the experiments of AC sonometer and Melde's experiment.
- acquire the knowledge on magnetic field theory, thermal conductivity by conducting experiments of field along the axis of a circular coil and thermal conductivity of bad conductor
- understand the concepts of light by conducting the experiments of determination of wave length, numerical aperture of an optical fibre and also from V–I characteristics of Solar cell and LED.

LIST OF EXPERIMENTS

1. Determination of velocity of ultrasonic waves in liquids.
2. Melde's experiment - transverse and longitudinal modes.
3. Determination of wave length – Helium - Neon laser.
4. Determination of Planck's constant.
5. Determination of Frequency of alternating current.
6. Field along the axis of a circular coil – Stewart and Gee's apparatus.
7. Band gap of semiconductor.
8. Hall coefficient.
9. Thermal conductivity of bad conductor - Lee's method.
10. Optical Fibre – Determination of numerical aperture.
11. Solar Cell – efficiency.
12. Study of V – I characteristics of LED.
13. Seebeck effect.

REFERENCE BOOKS :

1. Jayaraman, "Engineering Physics Laboratory manual", 1st edition, Pearson Education, 2014.
2. Engineering Physics Laboratory Manual – Department of Physics, VFSTR University, 2016.



16HS106 BASIC MATHEMATICS – II

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

This course offers basic concepts on matrices, system of equations, differential equations of first and higher order. Further, numerical methods to solve differential equations are introduced.

The objective of the course is to provide the knowledge on the properties of matrices and solving system of equations using matrices. It is also aimed to offer various methods (analytical as well as numerical) to solve first and second order ordinary differential equations.

Course Outcomes:

The student will be able to :

- understand the basic concepts, properties and operations on matrices.
- determine when a system of equations is consistent or not and solve it whenever possible.
- determine when the matrix has an inverse and find it when it exists.
- identify the method to solve the differential equations.
- find the complete solution of a homogeneous and non homogenerous differential equations with constant coefficients.
- evaluate integrals and solving differential equations using numerical methods.
- compare the solutions of differential equations by numerical methods with exact solution of that equation using MATLAB.

SKILLS:

✓ *Compare the inverse of matrix.*

✓ *Solve given system of linear equations.*

✓ *Solve given differential equations.*

UNIT - 1 **L-9, T-3**

MATRICES: Definition, types of matrices, algebra of matrices, determinant, minor, cofactor, adjoint, and inverse of a matrix; Elementary row operations, inverse by row operations, rank, determination of rank using Echelon form and normal form.

UNIT - 2 **L-9, T-3**

SYSTEM OF EQUATIONS: System of linear equations, consistency of system of equations, solution by Cramer's rule, matrix inversion method, Gauss-Jordan method and Gauss elimination method.

UNIT - 3 **L-9, T-3**

FIRST ORDER ORDINARY DIFFERENTIAL: Introduction, variable separable, linear equations, Bernoulli equation, homogenous equations and non-homogenous equations.

UNIT - 4 **L-9, T-3**

SECOND ORDER ORDINARY DIFFERENTIAL EQUATIONS : Linear differential equations of second order with constant coefficients with RHS of type e^{ax}, $\sin ax$, $\cos ax$, x^n.

UNIT - 5 **L-9, T-3**

NUMERICAL METHODS - II: Numerical integration by trapezoidal rule and Simpson's rules; Numerical solutions to Differential equations - Euler's method and Runga-Kutte method.

ACTIVITIES:

- *Compute the inverse of matrix and compare with MATLAB output.*
- *Solve given system of linear equations and compare with MATLAB output.*
- *Solve given differential equations and compare with MATLAB output.*

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Matrix algebra.
2. Rank of a matrix.
3. System of equations (Direct method).
4. System of equations (Cramer's rule).
5. System of equations (Matrix inversion method).
6. Solutions of first order ODE.
7. Trapezoidal rule.
8. Simpson's one-third rule.
9. Simpson's three-eight rule.
10. Euler's method.
11. RK Method.

Text BOOKS :

16HS107 ENGINEERING CHEMISTRY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	-	10	-	-

Course Description and Objectives:

This course aims to develop fundamental knowledge on new engineering materials and their significance in science and engineering applications. In addition, characterization of materials using basic and advanced experimental techniques is also offered. Besides, analysis of water sample and treatment method for domestic, commercial and industrial applications are also covered.

Course Outcomes:

The student will be able to :

- understand the limitations of using hard water for domestic and industrial purposes.
- choose and apply suitable methods to soften the hard water for industrial and domestic applications.
- understand electrochemistry and its importance for applications such as fuel cells, modern lithium ion batteries etc.
- understand the types of corrosion and their implications followed by their control and prevention methods.
- familiarize the preparation, properties and applications of various polymers.

SKILLS:

✓ *Analyse the total hardness of water sample.*

✓ *Understand the basic principles involved in various batteries.*

✓ *Understand the mechanisms of corrosion and various controlling methods.*

✓ *Synthesize various polymers.*

✓ *Identify the functional groups present in chemical compounds using Infrared and Ultraviolet instruments.*

UNIT - 1 **L-9**

WATER TECHNOLOGY : Introduction, WHO, BIS standards of water; Hardness of water- determination of hardness by EDTA (numerical problems), disadvantages of hard water, scales and sludges, caustic embrittlement, boiler corrosion, priming and foaming; Softening methods - zeolite process, ion exchange process; Desalination of brackish water- reverse osmosis and electrodialysis.

UNIT - 2 **L-9**

ELECTRO CHEMISTRY: Electrode potential; Electrochemical series; Nernst equation; Reference electrodes - Calomel and standard hydrogen electrode, ion selective electrode and glass electrode; Determination of pH by pH meter, primary cell and secondary cell (lead-acid storage cell and lithium ion battery); Fuel cell - hydrogen oxygen and methanol oxygen.

UNIT - 3 **L-9**

SCIENCE OF CORROSION : Introduction, dry corrosion, wet corrosion and mechanisms of wet corrosion; Bimetallic corrosion - concentration cell corrosion; Factors influencing the rate of corrosion; Corrosion control methods - cathodic protection, electroplating, electrolessplating and corrosion inhibitors.

UNIT - 4 **L-9**

POLYMERS: Introduction; Types of polymerization - preparation, properties and applications of polyethylene, PVC, teflon, bakelite, urea, formaldehyde and silicones; Rubber – vulcanization; Synthetic rubbers - buna-S, buna-N and neoprene; Introduction to conducting polymers - poly thiophene.

UNIT - 5 **L-9**

INSTRUMENTAL TECHNIQUES: Interaction of radiation with matter, UV - Visible Spectroscopy, Beer - Lambert's law, qualitative and quantitative analysis; Block diagram of UV-Visible spectrophotometer; IR Spectroscopy - types of vibrations and block diagram of IR spectrophotometer.

TEXT BOOKS :

1. P.C Jain and M. Jain, "Engineering Chemistry", 17th edition, Dhanpat Rai Publications, 2010.
2. S. Chavala, "A Text book of Engineering Chemistry Engineering Materials and Applications", 3rd edition, Dhanpat Rai Publications, 2015.

REFERENCE BOOKS:

1. K.S. Maheswaramma and M. Chugh, "Engineering Chemistry", 1st edition, Pearson publication, 2015.
2. M.R. Senapati, "Advanced Engineering Chemistry", 2nd edition, Lakshmi Publications, 2006.
3. H. W. Wilard and DeMerit, "Instrumental methods of Analysis", 7th edition, CBS Publications,1986.
4. G. Raj and C. Anand, "Instrumental Methods of Analysis", 5th edition, Himalaya Publications, 2007.
5. J.D. Bares, M.Thomas, B. S. Sankar, J.Mendham and R.C Denney, "Vogel's Text book of Qualitative Chemical Analysis", 6th edition, Pearson Publications, 2009.
6. Dr.S. Rattan, "Experiments in Applied Chemistry", S.K. Kataria and Sons Publications, 2008.

ACTIVITIES:

- *Collect water samples from different villages near VFSTR University and determine the total hardness, and total alkalinity.*
- *Present the water analysis report to the villagers and suggest proper measures to be taken.*
- *Measure the rate of corrosion of iron objects by weight loss method.*
- *Identify some of the functional groups like carboxylicacid, aldehyde and ketones by I.R. Spectroscopy.*
- *Collect water sample from different villages and estimate the fluoride present in the raw water and suggest some steps for the removal of fluoride.*

16ME101 ENGINEERING GRAPHICS

Hours Per Week :

L	T	P	C
1	-	3	3

Total Hours :

L	T	P
15		45

WA/RA	SSH/HSH	CS	SA	S	BS
6	15	-	5	-	-

Course Description and Objectives:

The main aim of this course is to familiarize the students with the conventional concepts of engineering drawing and computer aided applications in various fields. Engineering graphics is an "International language of Engineers". It is the most effective method of communicating technical ideas in 2D and 3D format.

Course Outcomes:

The student will be able to :

- sketch engineering objects in the freehand mode.
- create geometric construction with hand tools.
- create dimensions of objects.
- prepare plan and elevation of any pictorial view.
- draw freehand lettering.
- make isometric sketches using graphics.
- draw orthographic multi-view sketches using graphics.

SKILLS:

- ✓ *Draw free hand sketches, layouts, circuit diagrams, plan and elevations.*
- ✓ *Draw geometrical objects like polygons, solids of different types.*
- ✓ *Visualize the objects in real time situations.*
- ✓ *Develop 3D views (isometric views).*

UNIT - 1 **L-3, P-10**

INTRODUCTION TO ENGINEERING DRAWING: Introduction to engineering drawing- types of lines, lettering, dimensioning, construction of polygon and conics (ellipse, parabola and hyperbola by general method) and ellipse by oblong method.

UNIT - 2 **L-3, P-8**

ORTHOGRAPHIC PROJECTIONS: Principle of projection-planes of projections, projections of points, projection of straight lines; Inclined to one plane and both the planes; Projections of planes; Simple planes; Planes inclined to one reference planes.

UNIT - 3 **L-3, P-8**

PROJECTIONS OF SOLIDS: Projections of prisms, pyramids, cylinders, cones and solid axis inclined to one plane.

UNIT - 4 **L-3, P-10**

AUTOCAD: Introduction to AutoCAD

ISOMETRIC VIEWS: Isometric drawing of simple objects; Isometric view of prisms; Pyramids; Cone and cylinder; Simple orthographic views into isometric views through AutoCAD.

UNIT - 5 **L-3, P-9**

ORTHOGRAPHIC VIEWS: Conversion of pictorial views into orthographic views through AutoCAD.

TEXT BOOKS :

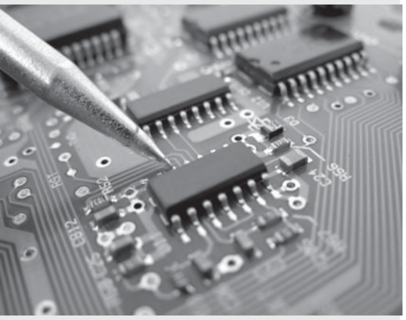
1. N.D.Bhatt, “Engineering Drawing”, 53rd edition, Charotar Publication, 2014.
2. B.Agrawal and C.M.Agrawal, “Engineering Drawing” , 2nd edition, Tata McGraw Hill, 2014.

REFERENCE BOOKS :

1. J. Hole, “Engineering Drawing”, 2nd edition, Tata McGraw Hill, 2008.
2. K.L. Narayana, “Engineering drawing”, 2nd edition, Scitech Publications, 2008.

ACTIVITIES:

- *Draw line diagram of different machineries.*
- *Draw plan and elevations of buildings and engineering products.*
- *Understand, visualize 3-D components/ products and develop drawings.*
- *Draw different curves used in several engineering applications such as bridges, dams etc.*



16EE102 BASICS OF ELECTRICAL AND ELECTRONICS ENGINEERING

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	30	5	40	-	8	5	5

Course Description and Objectives:

This course provides an in-sight into the functioning of basic electrical components like resistor, inductor and capacitor. It deals with the constructional and operational details of both DC and AC machines. It also deals with the basic electronic components like P-N junction Diode, Zener diode, transistor and their characteristics.

Course Outcomes:

The student will be able to:

- understand the notation and usage of components in electric circuits.
- analyze AC (single and three phase) and DC using different methods and laws.
- operate various electrical machines.
- understand the concepts of semiconductor devices and their operation.

SKILLS:

✓ *Distinguish between linear and nonlinear elements by looking at VI characteristics.*

✓ *Develop a simple loop generator.*

✓ *Design a voltage regulator using Zener diode.*

✓ *Design a half wave rectifier using PN junction diode.*

✓ *Design a full wave rectifier using PN junction diodes.*

UNIT - 1 **L-9**

FUNDAMENTALS OF DC CIRCUITS: Circuit Concepts; Concepts of network- active and passive elements, voltage and current sources, concept of linearity and linear network, unilateral and bilateral elements, R, L and C as linear elements; Ohm's Law; Kirchhoff's Laws; Application to simple series, parallel circuits, mesh and nodal analysis of simple resistive circuits (simple numerical problems).

UNIT - 2 **L-9**

FUNDAMENTALS OF AC CIRCUITS: Generation of AC voltage - frequency, average value, RMS value, form factor, peak factor for sinusoidal only; Phasor representation of alternating quantities; Analysis of simple series and parallel AC circuits (simple numerical problems).

BALANCED THREE PHASE SYSTEMS: Relation between phase and line quantities of voltages and currents in star and delta connected systems (elementary treatment only).

UNIT - 3 **L-9**

FUNDAMENTALS OF ELECTROMAGNETISM: Concepts of magneto motive force, reluctance, flux and flux density, concept of self Inductance and mutual Inductance, coefficient of coupling (only elementary treatment and simple numerical problems).

TRANSFORMERS: Principle of operation of single phase transformer, constructional features, EMF equation (simple numerical problems).

UNIT - 4 **L-9**

DC MACHINES: Constructional details of a DC machine, DC generator, principle of operation; EMF equation, types of DC generators (simple numerical problems).

DC motor- principle of operation, torque equation, types of DC motors (simple numerical problems)

AC MACHINES: Principle of operation of three phase induction motors, slip ring and squirrel cage motors, torque equation, constructional details of synchronous machine.

UNIT - 5 **L-9**

SEMICONDUCTOR DEVICES: Classification of solids based on energy band theory; Intrinsic and extrinsic semiconductors, P-type and N-type semiconductors, P-N junction diode and its characteristics; Half and full wave rectifiers; Zener diode and its characteristics; Voltage regulator; Bi polar junction transistor, operation, types and applications.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Verification of Ohm's law.
2. Verification of Kirchhoff's current law.
3. Verification of Kirchhoff's voltage law.
4. Measurement of energy in single phase resistive load circuit.
5. Measurement of Power in single phase resistive load circuit.
6. Transformation ratio of a single phase transformer at different loads.
7. Verification of PN junction diode characteristics under both forward and reverse bias.

ACTIVITIES:

- *Decode the value of resistors.*
- *Design and fabricate a simple loop permanent magnet generator.*
- *Design and fabricate a simple air cored transformer.*
- *Fabricate full and half wave rectifiers using PN junction diodes.*
- *Fabricate a voltage regulator using Zener diode.*

8. Verification of Zener diode characteristics under both forward and reverse bias.
9. Implementation of half wave rectifier without filter.
10. Implementation of full wave rectifier without filter.

TEXT BOOKS:

1. V. K. Mehta, “Principles of Electrical Engineering and Electronics”, 3rd edition, S. Chand Publications, New Delhi, 2010.
2. D. P. Kothari, “Basic Electrical and Electronics Engineering”, 1st edition, TMH, New Delhi, 2014.

REFERENCE BOOKS:

1. Millman and Halkias, “Integrated Electronics”, McGraw Hill, 1979.
2. A. K. Thereja and B.L. Thereja, “Electrical Technology”, Vol–II, S. Chand Publications, 2007.

16HS111 ENGINEERING CHEMISTRY LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course Description and Objectives:

This course is aimed at enlightening the importance of theoretical concepts of chemistry and experimental techniques for characterization of materials.

Course Outcomes:

The student will be able to :

- analyse the total hardness present in water samples.
- determine the total alkalinity of water used in industries.
- acquire the knowledge on polymers used as insulators.
- familiarize advanced techniques in chemical analysis using conductometer and pH meter.

LIST OF EXPERIMENTS

1. Determination of total alkalinity of water.
2. Estimation of total hardness of water.
3. Find the percentage of available chlorine in bleaching powder.
4. Estimation of Fe (II) by dichrometry method.
5. Preparation of phenol - formaldehyde resin.
6. Synthesis of urea- formaldehyde resin.
7. Estimation of concentration of acid by pH metry.
8. Determination of strength of acid by conductometry.
9. Measurement of Mn^{+7} by colorimetry.
10. Determination of concentration of a salt by ion exchange method.
11. Find the concentration of Mn^{+7} and Cr^{+6} by UV-visible spectrophotometry.
12. Find the rate of corrosion by weight loss method.

TEXT BOOKS :

1. J. Mendham, R. C. Denney, J. D. Bares, M. Thomas and B. S. Sankar, “Vogel’s Text book of qualitative Chemical Analysis”, Volume I, Pearson Publications, 2009.
2. S. Rattan, “Experiments in Applied Chemistry”, S. K. Kataria and Sons Publications, 2008.

16HS109 ENVIRONMENTAL SCIENCE AND TECHNOLOGY

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P
30	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	20	4	-	4	-

Course Description and Objectives:

Environmental science and technology offers technological aspects of environmental science and in maintaining environmental integrity in relation to human development. It helps every engineer to plan appropriate strategies for addressing environmental issues and also contribute to the development of innovative technologies for solving such issues. It produces professionals who will ensure sustainable development of the nation in general and environmental in particular.

Course Outcomes:

The student will be able to :

- observe and integrate the diverse information from sources outside the classroom.
- think critically, creatively, resourcefully and strategically, including identifying steps needed to reach goals, manage projects, evaluate progress, and adapt approaches, developing both self reliance and civic mindedness.
- adapt eco-friendly technologies in order to maintain hygienic conditions.
- understand the human activities that are detrimental to environment.
- collaborate across diverse disciplines to identify and create solutions that conserve and help maintain biodiversity in the long term.
- discuss the issues involved in the generation of renewable energy resources.

SKILLS:

✓ *Understand structural relationships, abstract models, symbolic languages and deductive reasoning.*

✓ *Gain perspectives to adrress the challenges, improvise and devise solutions.*

✓ *Identify solutions to environment and development issues, using planning, analysis, modeling, and new approaches.*

✓ *Acquire fieldwork techniques to study, observe and prepare documents, charts, PPTs, Models etc.*

✓ *Understand how natural resources should be used judiciously, to protect biodiversity and maintain ecosystem.*

UNIT - 1 **L-6**

NATURAL RESOURCES : Environmental Studies- definition, scope and its importance; Need for public awareness, natural resources, forest resources and deforestation; Water resources - properties and conflicts; Mineral resources - extraction and impacts; Food resources - modern agriculture methods, fertilizer-pesticide problems, water logging and salinity; Energy resources - renewable and non-renewable energy resources, harness technology, solar energy technologies; Land resources - land degradation, soil erosion; Role of an individual in conservation of natural resources.

UNIT - 2 **L-6**

ECOSYSTEMS AND BIODIVERSITY : Ecosystem - concept, structure and functions of an ecosystem; Food chains, food webs, ecological pyramids, energy flow, energy regulation and succession; Biogeochemical cycles; Aquatic ecosystems; Biodiversity - introduction, bio-geographical classification, values of biodiversity, biodiversity at global, national and local levels, hot-spots of biodiversity, threats to biodiversity, endangered and endemic species of India and conservation of biodiversity.

UNIT - 3 **L -6**

WASTE MANAGEMENT AND GREEN TECHNOLOGY : Solid waste management - causes, effects and control measures of municipal and industrial wastes; Pollution - air, water, thermal, soil and noise pollutions; Role of an individual in prevention of pollution; Remote sensing / GIS - introduction, definitions, applications of the remote sensing; Innovative practices-objectives, innovative practices in agriculture, forest-community and bio-villages; Green technology for sustainable development, life cycle assessment and its concept.

UNIT - 4 **L-6**

SOCIAL ISSUES AND EIA : Sustainable development, water conservation, cloud seeding, rainwater harvesting methods, watershed management, global warming, acid rain, ozone layer depletion; Environmental legislation; wildlife protection act, water act, forest conservation act, air act, environmental protection act; Environmental impact assssment (EIA) - introduction, definition of EIA and EIS, scope and objectives, importance of EIA in proposed projects/industry/developmental activity.

UNIT - 5 **L-6**

ENVIRONMENTAL SANITATION : Food sanitation **-** food and drugs act, food preservations, milk sanitation, tests for milk, pasteurization of the milk; Water, air, soil and food borne diseases; Maintenance of sanitary and hygienic conditions; Role of youth in the development; Promoting activities -youth as initiators and activities; Field work/environmental visit - visit to a local area to document environmental assets river/ forest/grassland/hill/mountain; Study of local environment - common plants, insects, birds; Study of simple ecosystems - pond, river, hill slopes etc., Visit to industries/water treatment plants/effluent treatment plants.

TEXT BOOKS:

1. A. Kaushik and C. P. Kaushik, “Perspectives in Environmental Studies”, 5th edition, 2016.
2. B. Joseph, “Environmental studies”, 2nd edition, McGraw Hill Education, 2015.

REFERENCE BOOKS:

1. M. Chandrasekhar, “A Text book of Environmental Studies”, HI-TECH publications, 2006.
2. M. Anji Reddy, “A Text book of environmental science and Technology”, B S Publications, 2008.
3. K. Mukkanti, “A Text book of Environmental Studies”, S. Chand and Company Ltd, 2009.
4. EHILRS and ST, “Text book of Municipal and Rural Sanitation”, M.S Hill, 1998.
5. C. S. Rao, “Environmental Pollution Control Engineering”, New Age International Ltd, 2001.

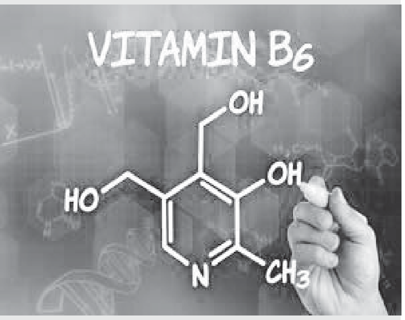
7. K. Joseph and R. Nagendram, “Essentials of environmental studies”, Pearson Education Pt Ltd, Delhi, 2007. Education Pt Ltd, Delhi, 2007.

ACTIVITIES:

- *Painting contests on environmental issues and themes.*
- *Models of energy resources, Pollution and Solid Waste Management-3R strategy.*
- *Quiz competition.*
- *Essay writing competition.*
- *Skit, JAM and debate.*
- *Field work and documentation.*
- *Assignments.*



16FT101 BIOCHEMISTRY AND NUTRITION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	20

WA/RA	SSH/HSH	CS	SA	S	BS
5	45	2	12	2	5

Course Description and Objectives:

This course offers the students knowledge on biological basis of nutrition, metabolic pathways, enzyme activity and mechanisms by which diet can influence health. The objective of this course is to empower the students with methods and techniques for molecular weight estimation of proteins, qualitative analysis of edible fats and oils and make nutrient profiles for balanced diet and health.

Course Outcomes:

The student will be able to:

- describe the major metabolic pathways involved in the metabolism of nutrients in the human body.
- analyze the roles of biomolecules in metabolic reactions and relate metabolism with human nutrition.
- understand the basis of reactivity of biologically relevant molecules and their interactions.

SKILLS:

- ✓ *Separation and molecular weight estimation of proteins*
- ✓ *Quality analysis of edible fats and oils*
- ✓ *Identify and recommend micro and macro nutrient profile for balanced diet and health*
- ✓ *Enzyme activity measurement and determining the mechanism of the reaction.*

UNIT - 1 **L-9**

CARBOHYDRATE METABOLISM: Metabolic pathways for breakdown of carbohydrates, Glycolytic pathway, Pentose phosphate pathway, Citric acid cycle, Electron transport chain, ATP balance, Gluconeogenesis.

UNIT - 2 **L-9**

LIPID METABOLISM: Essential fatty acids, Digestion and absorption of lipids. Lipids: Utilization of fats, Biosynthesis of fatty acids and fats, Clinical disorders associated with fats.

UNIT - 3 **L-9**

PROTEIN METABOLISM: Metabolism of proteins (digestion and absorption), Nitrogen balance and nitrogen pool, Evaluation of quality of protein.

UNIT - 4 **L-9**

ENZYMES: Definition, Function, Classification, Nomenclature &structure,:Co-enzymes and its function; Mechanism of enzyme action, Enzyme kinetics & environmental effects, Enzyme inhibition.

UNIT - 5 **L-9**

VITAMINS AND MINERALS: Occurrence, Physiological functions of vitamins and minerals. Introduction to human nutrition, Nutritive values of foods, Basal metabolic rate, Techniques for assessment of human nutrition, Dietary requirements and deficiency diseases of different nutrients.

ACTIVITIES:

- *Report on food particle disintegration in a prototype stomach model..*
- *Review on starch modification methods and its applications in food industry.*
- *Estimation of RDA values for different micro and macro nutrients.*

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Preparation of standard acid and alkali solutions.
2. Preparation of standard graph for quantification of biomolecules.
3. Verification Beer- Lambert's law using colorimetry.
4. Estimation of DNA and RNA by Spectrophotometric method.
5. Acid hydrolysis and action of salivary amylase on starch.
6. Enzymatic hydrolysis of sucrose and measurement of optical rotation.
7. Testing Creatinine activity.
8. Separation of proteins by SDS-PAGE.
9. Gelling properties of starch.
10. Specific gravity and Oxidative rancidity of fat and oils.

TEXT BOOKS :

1. M. M. Cox, "Lehninger principles of biochemistry". 4th edition. New York: Worth Publishers, 2000.
2. R. F. Boyer, "Modern Experimental Biochemistry", 3rd edition, Pearson Education, 2009.

REFERENCE BOOKS :

1. L. Stryer, "Biochemistry", 3rd edition. Freeman & Co, New York. 2009.
2. D. Voet, J. G. Voet and C. W. Pratt, "Fundamentals of Biochemistry", 4th edition. Jonh Willey & Sons, 2013.

16ME103 WORKSHOP PRACTICE

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	45

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	20	-	-

Course Description and Objectives:

This course is aimed to impart knowledge and provide hands-on experience in Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring. In addition it also provides knowledge on various manufacturing processes such as Foundary, Welding, Machine Shops and CNC Machines.

Course Outcomes:

The student will be able to :

- identify various tools connected to the trades such as Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring.
- fabrication of wooden joints and understand joining of metals.
- make metal joints and sheet metal work.
- make metal tools like knives, needles, swords, arrows, etc.

SKILLS:

✓ *Prepare wooden and metal furniture.*

✓ *Electrical wiring and power supply in residences.*

✓ *Make funnels, trays, locker, steel almirahs, etc.*

✓ *Fabrication of various agriculture tools, hooks, axes, axels, rims, etc.*

✓ *CNC machines and various machining operations and processes.*

EXERCISES IN THE FOLLOWING TRADES :

1. Carpentry.
2. Fitting.
3. Tin Smithy and Black Smithy.
4. House Wiring.
5. Foundry and Welding (Demonstration).
6. Machine shop and CNC (Demonstration).

Note: In each trade, the student has to perform at least two jobs.

TEXT BOOKS :

1. S.K. Hazra Choudhury, "Elements of workshop Technology", 11th edition, Media Promoters, 1997.
2. Gopal, T.V., Kumar, T., and Murali, G., "A first course on workshop practice: Theory, Practice and Work Book", Suma Publications, Chennai, 2005.
3. Venkatachalapathy, V. S., "First year Engineering Workshop Practice", Ramalinga Publications, Madurai, 1999.

ACTIVITIES:

- *To make wooden joints like Mortise and Tenon joint, T-lap Joint which are used to prepare a wooden furniture.*
- *To prepare metal joints and metal sheet products like V-Joint and trays by using mild steel flats and Galvonised iron sheets.*
- *Trials on electrical circuit connections.*

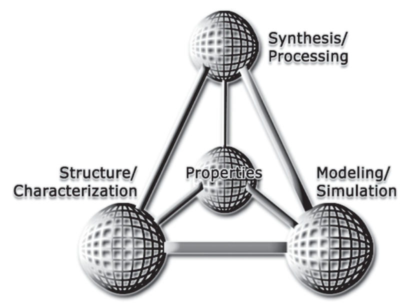
16CH102 MATERIALS SCIENCE AND TECHNOLOGY



Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
8	60	-	10	-	-

Course Description and Objectives:

This course will emphasize the structure-property relationships of engineering materials. The objective of this course is to provide knowledge in basic principles of material science and also to study structure of materials at all length scales.

Course Outcomes:

The student will be able to:

- understand crystal structure of various materials and techniques used for structure determination.
- understand the influence of defects on the properties of materials.
- understand the fundamentals of equilibrium phase diagrams.
- gain knowledge on various fabrication techniques used for manufacturing common engineering materials.

SKILLS:

✓ *Identify the type of material: ceramic, polymer, metal or composite.*

✓ *Select materials with suitable properties for a given application.*

✓ *Predict the type of fracture/failure in a material.*

✓ *Read and draw conclusion from binary phase diagrams.*

✓ *Suggest manufacturing methods for metals, ceramics and polymeric materials.*

✓ *Determine basic mechanical properties of materials using universal testing machine.*

ACTIVITIES:

- *Testing the type of failures.*
- *"Gee Whiz": Wonder presentations.*
- *Analysis of load test results.*
- *Study of micro structures of materials.*
- *Segregation of the given materials.*
- *Identification of phases in the given phase diagram.*

UNIT - I **L-9, T-3**

BONDING IN SOLIDS : Inter atomic forces and potential energy, Types of bonds: Primary and secondary, Variation in bonding character and resulting properties.

CRYSTAL STRUCTURE : Classification of crystal systems–SC, BCC, FCC & HCP crystal structures with examples, Atomic packing factor, Coordination number, Determination of miller indices of planes and directions of cubic and hexagonal crystals, Linear and planar densities, Separation between successive planes, Crystal structure determination: Bragg law, Powder method.

UNIT - 2 **L-10, T-3**

CRYSTAL DEFECTS : Point defects, Dislocations: Edge, Screw and mixed, Burgers vectors, Energy of dislocation, Motion of dislocation, Dislocation density. Grain boundary, Stacking faults and twin boundary.

PHASE DIAGRAMS : Gibb's phase rule and terms involved–Reduced phase rule, Tie line and lever rules, Two component systems–invariant reactions–Eutectic system and Iron-Carbon system.

UNIT - 3 **L-9, T-3**

MATERIALS FABRICATION TECHNIQUES : Fabrication of Metals: Forming operations, Casting, Fabrication of Ceramics: Particulate forming processes, Cementation. Forming techniques of Plastics: Compression, Transfer and injection molding, Extrusion, Blow molding.

MECHANICAL PROPERTIES : Stress-Strain relations of various solids–Elastic, Anelastic, Visco-elastic and plastic deformations in solids, Creep and fatigue, Fracture: Brittle and Ductile, Fracture toughness, Ductile to brittle transitions.

UNIT - 4 **L-8, T-3**

ELECTRICAL & SEMICONDUCTING PROPERTIES : Ohm's Law, Electrical conductivity, Electronic and Ionic conduction, Energy band structures in Solids, Classification of solids based on band models, Electron mobility, Electrical resistivity of metals, Intrinsic semiconduction, Extrinsic Semiconduction, The temperature dependence of carrier concentration, Factors that affect carrier mobility.

UNIT - 5 **L-8, T-3**

DIELECTRIC AND MAGNETIC PROPERTIES : Dielectric behavior, Capacitance, Polarization, Frequency Dependence of dielectric constant, Dielectric strength. Types of magnetism, Ferromagnetism-Domain theory-hystersis behavior, Ferrimagnetism, Soft and hard magnets–application of magnetic materials.

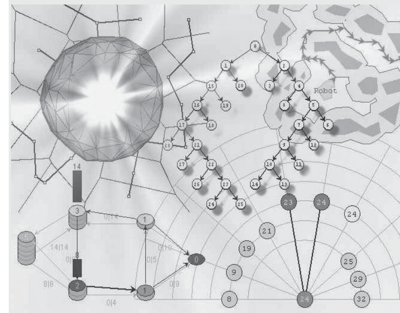
16CS202 DATA STRUCTURES



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course will emphasize the structure-property relationships of engineering materials. The objective of this course is to provide knowledge in basic principles of material science and also to study structure of materials at all length scales.

Course Outcomes:

The student will be able to:

- apply advanced C programming techniques such as pointers, dynamic memory allocation, structures to develop solutions for particular problems.
- analyze characteristics of various data structures.
- differentiate between Graphs and Trees.
- understand the importance of sorting and applying it wherever useful.
- understand the usefulness of data structures in solving problems.

SKILLS:

✓ *Identify the required data structures for various applications.*

✓ *Identify the sorting algorithm suitable for a given scenario.*

✓ *Implement array or linked list for a given problem.*

✓ *Analyse Pros & Cons of each of the data structure.*

✓ *Usage of trees and graphs.*

UNIT - 1 **L-9**

SORTING AND SEARCHING: Introduction - Data, Data type, Data structure, Primitive and Non-primitive - Data type, Data structure; Storage structures - Sequential and linked storage representations; Applications of structures, Hashing.

SORTING: Selection sort, Bubble sort, Insertion sort, Quick sort, Merge sort.

SEARCHING: Binary search and linear search.

UNIT - 2 **L-9**

LINKED LISTS: Introduction, Types of linked list - Singly linked list, Doubly linked list, Circular linked List; Operations - Insertion, Deletion, Traverse forward/reverse order; Multi lists, Applications of linked lists.

UNIT - 3 **L- 9**

STACKS AND QUEUES: Stacks - Introduction, Array and linked representations, Implementation and their applications; Queues - Introduction, Array and linked representations, Implementation and their applications, Types - Linear, Circular and doubly ended queues; Applications.

UNIT - 4 **L-9**

TREES: Introduction, Properties, Binary Tree - Introduction, Properties, Array and linked representations; Tree traversals and their Implementation, Expression trees, BST definition and implementation; AVL Trees - Definition and implementation.

UNIT - 5 **L-9**

GRAPHS: Introduction, Properties, Modeling problems as graphs representations - Adjacency matrix, Adjacency list; Traversals - Breath first search and depth first search; Application of graphs.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- understand the importance of structure, abstract data type and their basic usability in different applications through different programminglanguages.
- understand the linked implementation and its uses both in linear and non-linear data structure.
- understand various data structures such as stacks, queues, trees, graphs, etc. to solve various computing problems.
- decide a suitable data structure to solve a real world problem.

LIST OF EXPERIMENTS Total hours-30

1. Selection, Bubble, Insertion, Quick and Merge sorting algorithms.
2. Linear and Binary search algorithms.
3. Single linked list, doubly linked list, and circular linked list.
4. Stack using an array and linked list.
5. Queue using an array and linked list.
6. Tree using an array and linked list.
7. Check if given expression is fully parenthesis or not using stack.

ACTIVITIES:

- *Design and implement a school management system.*
- *Design and implement a social networking site.*
- *Implement a project to find out the most common words in the articles.*
- *Design and implement a library book management system.*
- *Design and implement a cric buzz application.*

8. Tree traversing techniques.
9. BST using an array and linked list.
10. Graph traversal techniques.

TEXT BOOK:

1. ReemaThareja, “Data Structures Using C”, 2nd edition, Oxford University Press, 2014.

REFERENCE BOOKS :

16EL102 SOFT SKILLS LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The Soft Skills Laboratory course is aimed at training undergraduate students on employability skills. Designed to impart work related skills, the course will enable trainees to develop interpersonal communication, leadership, preparing resumé, group discussion and interview skills. It will give them the required competence and confidence to handle professional tasks.

Course Outcomes:

The student will be able to :

- think critically on issues for informed decision making and know how to communicate effectively through choice of appropriate language and speech, while dealing with others at the workplace.
- identify and introspect on individual strengths and weaknesses.
- improve levels of self-awareness and self-worth for greater efficacy at workplace.

SKILLS:

- ✓ *Communicate and understand the difference between soft skills and hard skills.*
- ✓ *Professionalism and employability skills.*
- ✓ *Plan career by drawing their SWOT, setting the goal, learn the importance of time and stress management.*
- ✓ *Vocabulary, situational english, group discussion, reading comprehension and listening comprehension which are essential for all competitive examinations.*
- ✓ *Prepare resumé and learn how to face interview.*
- ✓ *Gender sensitive language, good manners, emotional intelligence and essential skills.*

UNIT - 1 **P-8**

A) COMMUNICATION: Need for effective communication - The process of communication, Levels of communication, Flow of communication, Choice of diction and style with reference to setting (formal, semi-formal or informal); Communication networks, Barriers to communication, Miscommunication, Noise and ways to overcome the barriers.

B) SOFT SKILLS: Difference between soft and hard skills, Need for soft skills, Professionalism, Employability skills.

C) CAREER PLANNING: Job vs career, Goal setting, SWOT analysis, Planning and prioritization, Four quadrant time management system, Self-management, Stress-management.

ACTIVITY: Johari Window for SWOT analysis, Setting a SMART goal using the provided grid, Writing a statement of purpose (SOP).

UNIT - 2 **P-8**

A) VOCABULARY BUILDING: Word etymology, Roots, Prefixes and suffixes, Synonyms and antonyms, Collocations, One-word substitutes, Analogies, Idioms and phrases, Contextual guessing of unfamiliar words, Task-oriented learning (50 words).

ACTIVITY: Making a flash card (one per day by each student), Vocabulary exercises with hand-outs, Vocabulary quiz (evaluation will be a combination of the 50 words provided by the instructor and the flash cards made by the student (one per day).

B) FUNCTIONAL ENGLISH: Situational dialogues, Role plays (including small talk), Self introduction, Opening and closing a telephonic conversation, Making an appointment, Making a query, Offering/ Passing on information, Communicating with superiors, Expressing agreement/objection, Opening bank account (combination of prepared and impromptu situations given to each student).

C) GROUP DISCUSSION: Articulation and flow of oral presentation, Dynamics of group discussion, Intervention,Summarizing and conclusion, Voice modulation, Content generation, Key word approach (KWA), Social, Political, Economic, Legal and technical approach (SPELT), View point of affected part (VAP), Language relevance, Fluency and coherence.

ACTIVITY: Viewing a recorded video of GD and Mock sessions on different types of GD topics - Controversial, Knowledge, Case study (including topics on current affairs).

UNIT - 3 **P-4**

A) RESUME-WRITING: Structure and presentation, Defining career objective, Projecting one's strengths and skill-sets, Summarizing, Formats and styles and covering letter.

ACTIVITY: Appraising some samples of good and bad resumes, Preparing the resume, Writing an effective covering letter.

B) FACING INTERVIEWS: Interview process, Understanding employer expectations, Pre-interview planning, Opening strategies, Impressive self-introduction, Answering strategies, Other critical aspects such as body language, Grooming, Other types of interviews such as stress-based interviews, Tele-interviews, Video interviews, Frequently asked questions (FAQs) including behavioural and HR questions and the aspect looked at by corporate during interviews.

ACTIVITY: Writing responses and practicing through role plays and mock interviews on the FAQs including feedback.

UNIT - 4 **P-4**

A) READING COMPREHENSION: Reading as a skill, Techniques for speed reading, Understanding the tone, Skimming and scanning, Appreciating stylistics, Impediments for speed reading, Eye fixation, Sub-vocalization, Critical reading, Reading based on purpose, Reading for information, Reading for inference.

ACTIVITIES:

- *Formal and informal communication.*
- *SWOT analysis.*
- *Stephen covey Time Management matrix.*
- *Stress Management techniques.*
- *Vocabulary flash cards.*
- *Situational Dialogues.*
- *Group Discussion.*
- *Resume preparation.*
- *Mock Interview.*
- *Reading comprehension activities.*
- *Listening comprehension Activity by watching the American accent video.*
- *Emotional intelligence, etiquette quiz.*

ACTIVITY: Reading comprehension exercises with texts drawn from diverse subject areas (Hand-outs), Newspaper activity with students divided into 4 groups, Each group looks at critical component of communication such as Listening, Speaking, Reading and writing enabling them to be better communicators as well as be more aware about the current affairs, Which help in group discussion.

B) LISTENING COMPREHENSION: Listening as a skill, Different types of listening, Active and passive listening, Top-down approach, Bottom-up approach, Understanding the non verbal cues of communication, Intonation and stress.

ACTIVITY: Narration of a story, Speech excerpts with different accents (Indian, British, American), listening comprehension exercises with audio and video excerpts.

UNIT - 5 **P-6**

IMPACT OF LANGUAGE ON PERSONALITY: Gender sensitive language in MNCs, Cultural sensitivity, Social awareness, Emotional intelligence, Good manners, Self-grooming, Positive body language, Accepting and handling responsibility, Assertiveness, Problem solving, Negotiating skills, Networking and creating a good first impression, Seven essential skills for a team player, Attentive listening, Intelligent questioning, Gently persuading, Respecting other's views, Assisting others, Sharing, Participating actively.

ACTIVITY: Johari Window, Games and case studies.

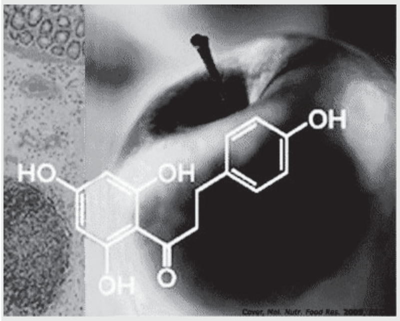
16FT201 FOOD CHEMISTRY



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	50	-	-	10	5

Course Description and Objectives:

This course deals with the chemical composition and properties of food nutrients and their physical, chemical, nutritional and functional changes during handling, processing, storage and utilization. The objective of this course is to impart knowledge on innate properties of food molecules and their interactions with other food constituents and also to empower the students with analytical techniques for identification and quantification of various biomolecules present in food.

Course Outcomes:

The student will be able to:

- understand the relationship between the chemical composition of food and food quality.
- elucidate why certain ingredients are used in food and major chemical reactions that limit shelf life of foods.
- explicate the rationale for certain food processes.

SKILLS:

✓ *Perform analytical techniques associated with food using basic analytical instrumentation.*

✓ *Critically analyze the chemical information, synthesize the information and validate it.*

✓ *Select appropriate analytical technique when presented with a practical problem.*

ACTIVITIES:

- *Checking efficacy of various solvents for edible oil extraction.*
- *Shelf life prediction of food products.*
- *Estimation of enzymatic reactions using Michaelis-Menten Equation.*

UNIT - 1 **L-9**

WATER AND ITS INFLUENCE : Structure, Water in foods and its properties, Liquid water and Ice, Interactions with food components, Water binding capacity and its determination, Water activity and its role in enhancing shelf life in foods.

UNIT - 2 **L-9**

CARBOHYDRATES: Classification, Physical, Chemical, Nutritional and Functional properties, Browning reactions, Caramelization, Gel formation, starch retro-gradation.

UNIT - 3 **L-9**

PROTEIN: Classification, Physical, chemical, nutritional, and functional properties, major food proteins and their sources, Changes in proteins during processing, Determination of proteins in foods.

UNIT - 4 **L-9**

LIPIDS: Classification, Physical, Chemical, Nutritional and functional properties, Edible oil refining, Technology of edible fats and oils processing: Fat hydrolysis, Interesterification, Hydrogenation, Shortenings and Spreads, Emulsions: properties and types.

UNIT - 5 **L-9**

VITAMINS AND MINERALS: Sources, Functions, Deficiency diseases, Requirements and recommended dietary allowances of vitamins, Changes during processing.

PIGMENTS: Introduction, Chlorophyll, Carotenoids, Flavonoid, Phenols, Betalains, Anthocyanins**.**

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Qualitative test for all carbohydrates - Solubility, Molisch, Anthrone, Iodine test.
2. Qualitative test for Pentoses, reducing sugars, (Bials,Fehlings, Benedicts, Barfoeds test)
3. Qualitative test for Glucose, Fructose, Sucrose (Osazone, Acid hydrolysis, Selewanoffs.)
4. Quantitative test for all Amino acids, aromatic amino acids, Sulphur containing amino acids. (Ninhydrin, Xanthoproteic, Nitro Prusside test).
5. Quantitative tests for peptide bonds and proteins (Biuret test &Folin - Lowry test).
6. Separation of amino acids by Paper chromatography.
7. Separation of lipids by thin layer chromatography.
8. Estimation of Viscosity and refractive index of foods.
9. Determination of free fatty acid content in fats and oils.
10. Estimation of chlorophyll and carotenoids in foods.

TEXTBOOKS:

1. H. D. Belitz, W. Grosch and P. Schieberle, “Food Chemistry”, 4th edition, Springer, 2009.

16FT202 FOOD MICROBIOLOGY

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
15	45	-	-	5	5

Course Description and Objectives:

This course deals with basics of food microbiology, preservation and spoilage of various food products. The objective of this course is to enable students to apply identification and enumeration techniques of microbes found in food products.

Course Outcomes:

The student will be able to:

- understand the characteristics, morphology and classification of food borne microorganisms.
- understand microbiology of food products.
- know about pathogens responsible for food spoilage.
- understand the principles involved in food preservation techniques.

SKILLS:

✓ *Prepare and sterilize media.*

✓ *Identify types of microorganisms present in food products.*

✓ *Prepare pure cultures of microbes.*

✓ *Isolate microorganisms from the food sample.*

ACTIVITIES:

- *Prepare flow charts for production of food products using different microorganisms.*

UNIT - 1 **L-9**

INTRODUCTION TO MICROBIOLOGY: Classification of microorganisms, Importance of microorganisms in food industry, Moulds: General characteristic, Classification and Identification. Yeasts and Yeast like fungi: General characteristics, Classification, Identification, Yeasts of industrial importance. Bacteria: Morphological, Cultural and Physiological characteristics, Examples of bacteria important in food bacteriology.

UNIT - 2 **L-9**

FOOD SPOILAGE: Microbial spoilage of foods, Cause of spoilage, Classification of foods by ease of spoilage, Factors affecting kinds and numbers of microorganisms in food, Factors affecting growth and survival of microorganisms in foods: Intrinsic factors and Extrinsic factors, Chemical changes caused by microorganisms: breakdown of proteins, carbohydrates, fats and other constituents during spoilage, Contamination of Food, Sources of contamination.

UNIT - 3 **L-9**

FOOD PRESESRVATION: Principles of preservation, Methods of food preservation: High temperature, Low temperature, Drying, Radiation, Chemical preservatives, Bio-preservatives, Hurdle technology, Active packaging, Novel processing technologies.

UNIT - 4 **L-9**

MICROBIOLOGY OF MILK AND MILK PRODUCTS: Microbiology of milk and milk products, Contamination, Preservation, Pasteurization, Freezing and Drying, Changes caused by microbes during milk and milk product spoilage: Gas production, Proteolysis, Ropiness, Changes in milk fat, Alkali production, Flavour changes and Colour changes.

MICROBIOLOGY OF FRUITS AND VEGETABLES: Contamination, Preservation of vegetables, Asepsis, Chilling, Freezing, Drying, Preservatives, CA storage, MA storage, Spoilage of fruits and vegetables.

MICROBIOLOGY OF CEREAL AND CEREAL PRODUCTS: Contamination, Preservation, Spoilage of flours and Bread.

UNIT - 5 **L-9**

MICROBIOLOGY OF MEAT AND MEAT PRODUCTS: Contamination, Preservation, Spoilage of meat and meat products, Changes during storage, Changes not caused by microorganisms, Changes caused by microorganism. Microbiology of canned foods: Causes of spoilage, Appearance of the unopened container, Types of biological spoilage of canned foods: Flat sour spoilage, TA spoilage, Sulphide spoilage. Types of spoilage of canned foods by Bacteria, Yeasts, Moulds. Spoilage of canned meat.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Introduction to different types of equipment used in food Microbiology Lab.
2. Preparation and sterilization of media.
3. Gram staining and microscopic examination of bacteria.
4. Techniques of pure culture (Pour plate and streak plate).
5. Isolation and Identification of molds from foods.
6. Microbial examination of milk.
7. To perform MBRT for milk.

8. Microbial examination of fruits and vegetable products – Isolation, Identification
9. Microbial examination of Fermented food – Isolation, Identification
10. Determination of effect of various preservatives on the suppression of microbial growth.

16FT203 THERMODYNAMICS AND HEAT ENGINES

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	5	-	5	5

Course Description and Objectives:

This course deals with laws of thermodynamics, refrigeration, liquefaction and steam generation processes. The objective of this course is to make students understand the theory and applications of classical thermodynamics, and thermodynamic properties, equations of state and the methods used to describe and predict phase equilibrium.

Course Outcomes:

The student will be able to:

- understand fundamentals of thermodynamic properties.
- derive and discuss the laws of thermodynamics.
- develop profound knowledge on refrigeration cycles.
- gain knowledge on different types of steam generators.

SKILLS:

✓ *Select suitable refrigerant for specific process.*

✓ *Estimate the thermal and volumetric properties of real fluids.*

✓ *Suggest industry specific boiler and usage.*

UNIT - 1 **L-9, T-3**

BASIC CONCEPTS: The scope of thermodynamics, Dimensions and units, Measures of amount or size, Force, Temperature, Pressure, Work, Energy, Heat, Zeroth law.

UNIT - 2 **L-9, T-3**

FIRST LAW OF THERMODYNAMICS: Joule's experiment, Internal energy, Statement of first law, Energy balance for closed system, Thermodynamic state and state functions, Equilibrium, phase rule, Reversible processes, Constant-v and Constant-p processes, Enthalpy, Heat capacity.

UNIT - 3 **L-9, T-3**

THE SECOND LAW OF THERMODYNAMICS: Statements of the second law, Heat engines, Thermodynamic temperature scales, Entropy, Mathematical statement of the Second law, Third law of thermodynamics.

UNIT - 4 **L-9, T-3**

REFRIGERATION AND LIQUEFACTION: The Carnot refrigerator, The vapor compression cycle, The choice of refrigerant, Absorption refrigeration, Liquefaction processes.

UNIT - 5 **L-9, T-3**

STEAM GENERATORS: Classification of boilers, Comparison of fire tube and water tube boilers, Function of mountings and accessories, Constructional and operational details of Cochran, Babcock and Wilcox boiler.

TEXT BOOKS

1. J. M. Smith, H. C. Vanness and M. M. Abbot, "Introduction to Chemical Engineering Thermodynamics", 6th edition, Tata McGraw Hill, 2005.
2. R. K. Rajput, "Thermal Engineering", 8th edition, Laxmi Publications, 2010.
3. Y. V. C. Rao, "Chemical Engineering Thermodynamics", 1st edition, Universities Press, 2004.

REFERENCE BOOKS

1. P. K. Nag, "Engineering Thermodynamics", 5th edition, McGraw-Hill Education India Private Limited, 2013.

ACTIVITIES:

- *Report on properties and environmental performance of some commonly used refrigerants in food industry.*
- *Report on Indian Boiler's Act and Indian Boiler Regulation.*

16FT204 FUNDAMENTALS OF FLUID MECHANICS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	-	5	5	5

Course Description and Objectives:

This course deals with fundamentals of fluid statics, dynamics, compressible and incompressible fluids, fluidization, transportation and metering of fluids. The objective of this course is to train students on the basic concepts of fluid flow and its application to chemical process industries.

Course Outcomes:

The student will be able to:

- understand basic principles of fluid mechanics.
- analyze fluid flow problems with the application of the momentum and energy equations.
- analyze pipe flows as well as fluid machinery.

SKILLS:

✓ *Analyze fluid flow situations for type of flow.*

✓ *Prescribe conditions for maintaining a given type of flow.*

✓ *Determine the velocity and pressure drop of fluid flowing through pipes.*

✓ *Select a meter for measuring flow rate and velocity of a flowing fluid.*

✓ *Select the pump for a given engineering application.*

UNIT - 1 **L-9**

INTRODUCTION TO FLUIDS: Definitions, Properties, Units and dimensions, Measurement of fluid pressure, Absolute and gauge pressure: Pressure head of the liquid, Pressure on vertical rectangle surfaces, Compressible and Non compressible fluids, Surface tension, Capillarity, Pressure measuring devices: Piezometer, Simple manometers, Inclined manometers, Differential manometers, Problems.

UNIT - 2 **L-9**

KINEMATICS OF FLUID FLOW : Introduction, Classification of flows: Steady, Uniform, Non uniform, Laminar and turbulent, Continuity of fluid flow, Boundary layer, Fully developed flow Bernoulli's theorem, Problems on Bernoulli's theorem,Venturimeter, Pitot tube, Orifice meter, Rotameter, Problems on Venturimeter ,Orifice meter.

UNIT - 3 **L-9**

FLOW THROUGH SIMPLE PIPES: Loss of head in pipes, Darcy's formula, Chezy's formula for loss of Head in pipes, Minor losses of energy, Hagen Poiseuille equation Drag, Drag Coefficients, Terminal velocity, Fluidization introduction, Types of fluidization Applications of fluidization, Problems on fluidization.

UNIT - 4 **L-9**

FLOW THROUGH ORIFICES: Types of orifices, Jet of water, Hydraulic coefficients, Experimental Method for Hydraulic Coefficients, Discharge through a rectangular orifice, Discharge over a Triangular Notch, Stepped Notch, Dimensional analysis and similitude, Buckingham's pi theorem, Hydraulic similitude.

UNIT - 5 **L-9**

DESIGN OF PIPES AND PUMPS: Pipes, Fittings, Valves, Pumps, Developed head & power requirement in pumps, Suction lift, Cavitation, Classification of pumps, Reciprocating pump, Centrifugal pumps, Pressure variation, Work efficiency, Types of chambers: Selection and sizing, Compressors, Fans and Blowers.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Identification of laminar and turbulent flows.
2. Verification of Bernoulli's Equation.
3. Measurement of flowing fluid using Venturimeter.
4. Measurement of flowing fluid using Orifice meter.
5. Determination of friction loss in fluid flow through pipes.
6. Determination of friction loss in fluid flow through fittings.
7. Determination of pressure drop in packed bed.
8. Determination of pressure drop in fluidized bed.
9. Determination of characteristics of centrifugal pump.
10. Determination of characteristics of reciprocating pump.

ACTIVITIES:

- *Calibration of rotameter.*
- *Calibration of manometer.*
- *Fabrication of Venturi meter.*
- *Fabrication of Orifice meter.*

16EL103 PROFESSIONAL COMMUNICATION LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The Professional Communication Laboratory course is aimed at improving professional communication skills (LSRW – Listening, Speaking, Reading and Writing) of undergraduate students and preparing them for their profession as engineers and managers. This course will help students to understand professional communication and personality as two interlinked spheres of influence, and provide them with exposure to conventions of corporate communication involved in the functioning of the business world.

Course Outcomes:

The student will be able to :

- clear industry recognized certification such as BEC Vantage by the University of Cambridge.
- stand out both in the professional setting as well as for further pursuits in the academic world.
- succeed confidently in all four critical components of communication - LSRW (listening, speaking, reading and writing).

SKILLS:

✓ *Grammar rules in writing sentences, paragraphs and paraphrasing.*

✓ *Compose business emails, memos, letters, reports and proposals.*

✓ *Comprehend business articles and documents.*

✓ *Use of expressions in professional context and acquire presentation skills like one minute talk and pair discussion.*

✓ *Familiarize and comprehend British accent by listening to recorded speeches and discussions.*

UNIT - 1 **LEARNING - 3 HRS + PRACTICE - 3HRS = 06 HRS**

BUSINESS ENGLISH VOCABULARY: Glossary of most commonly used words (formal and informal usage) **Elements of Technical Writing**- Sentence structure, reducing verbosity, arranging ideas logically, building coherence, paragraph level and document level, topic sentence, cohesive devices, transitional words, paraphrasing and précis-writing.

Mechanics of Writing- Stylistic elements, the rapporteur, the purpose, the reader's viewpoint (audience), elementary rules of grammar, choice of diction, elementary principles of composition, matters of form, punctuation, conventions of business communication, language and professional tone, weak links in business correspondence, ethical concerns in business writing, code of conduct (not sending illegal, offensive, disparaging personal remarks or comments) in written business communication.

UNIT - 2 **LEARNING - 3 HRS + PRACTICE - 3HRS = 06 HRS**

BUSINESS CORRESPONDENCE: E-mail- nature and scope, e-mail etiquette, clear call for action, common errors in composing e-mails, office communication such as meeting agenda and minutes of the meeting, notice, circular and memo.

Letter Writing - Formal and informal letters, structure of formal letters, expressions of salutations, different types of letters [such as sales letter, complaint letter, response to the complaint letter (dispute resolution), letter of permission, letter of enquiring, claim letter, letter of apology etc]; Introductory and concluding paragraphs and clear call for action.

PROFESSIONAL PROPOSAL/REPORT: Differentiating proposals and reports, Drafting formal business proposals, types of reports such as factual reports, feasibility reports and survey reports, parts of a report (such as title page, declaration, acknowledgements, table of contents, abstract, introduction, findings, conclusions, recommendations, citations, references and appendices).

UNIT - 3 **LEARNING - 3 HRS + PRACTICE - 3HRS = 06 HRS**

SPEAKING: Speaking in business context, assertiveness, politeness, making requests, queries and questions, negotiations, asking for information, offering suggestions, conflict resolution, contacting clients, initiating, addressing delegates (in public), features of a good power point presentation (making the PPT), delivering the presentation effectively, telephone etiquettes, delivering seminar/proposal/ report effectively, team meeting etiquettes (face to face and conference call), making effective one minute presentations.

UNIT - 4 **LEARNING - 3 HRS + PRACTICE - 3HRS = 06 HRS**

READING: Reading and comprehending business documents, learning business register, regularizing the habit of reading business news, suitable vocabulary, skimming and scanning text for effective and speedy reading and dealing with ideas from different sectors of corporate world in different business contexts.

UNIT - 5 **LEARNING - 3 HRS + PRACTICE - 3HRS = 06 HRS**

LISTENING: Specific information in business context, listening to telephonic conversations/messages and understanding the correct intended meaning, understanding the questions asked in interviews or in professional settings, summarizing speaker's opinion or suggestion and enable active listening.

TEXT BOOKS: BEC

1. G. B. Hart, "Cambridge English Business Bench Mark: Upper Intermediate', 2nd edition, CUP, 2004.
2. CUP, Cambridge: BEC VANTAGE: Practice Tests, CUP, 2002.

ONLINE REFERENCES:

1. http://www.cambridgeenglish.org/exams/business-certificates/business vantage/ preparation/
2. https://www.youtube.com/watch?v=qxFtn9pGaTI.

ACTIVITIES:

- *Basic grammar practice, framing paragraphs on topics allocated.*
- *Paraphrasing an article or a video in your own words. Finding topic sentences in newspaper articles.*
- *Finding out new words from a professional viewpoint. Understanding the meaning and its usage.*
- *Perusing samples of well prepared proposals and reports.*
- *Draft different proposals/reports on topics assigned.*
- *Watching videos/ listening to audios of business presentations.*
- *Classroom activities of team and individual presentations.*
- *Using PPTs, mock exercises for BEC speaking.*
- *Presenting (speaking) the written components completed in Unit 1.*
- *Hand-outs; matching the statements with texts.*
- *Finding missing appropriate sentence in the text from multiple choice, multiple choices.*
- *Using right vocabulary as per the given context and editing a paragraph.*

16HS202 PROBABILITY AND STATISTICS

Hours Per Week :

L	T	P	C
4	-	-	4

Total Hours :

L	T	P
60	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	35	-	10	2	-

Course Description and Objectives:

This course deals with descriptive statistics, correlation and regression and their applications, probability, theoritical distributions and testing of hypothesis.

The objective of this course is to enable the student to understand and apply statitical techniques, curve fitting, correlation and regression, probability and also to make the student familiar with discrete, continuous distributions and testing of hypothesis.

Course Outcomes:

The student will be able to:

- distinguish between quantitative and categorical data and represent the data in graphical and tabular forms.
- calculate and interpret measures for the centre and spread of a data set.
- decide how and when to use the normal model.
- calculate and interpret correlation coefficient and regression lines.
- understand the rules of probability and apply them.
- compute probabilities using theoritical distributions.
- test hypothesis for population parameters.

UNIT - 1 **L-9**

STATISTICS : Basic definitions, Frequencies, Graphical representation, Histogram, Ogive curves, Measures of central tendency, Arithmetic mean, Median, Mode, Mean deviation, Standard deviation, Symmetry and skewness, Karl Pearson's coefficient of skewness.

UNIT - 2 **L-9**

CURVE FITTING, CORRELATION & REGRESSION : Least squares method, Curve fitting (straight line and parabola only). Covariance, Correlation, Types, Pearson's coefficient of correlation, Rank correlation, Spearman's rank correlation. Regression, Regression lines.

UNIT - 3 **L-8**

PROBABILITY : Introduction, Definition (classical and axiomatic approach), Addition theorem, Conditional probability, Multiplication theorem, Total probability, Bayes theorem.

UNIT - 4 **L-8**

DISTRIBUTIONS: Random variables, Discrete and continuous variables, Introduction to distributions.

BINOMIAL DISTRIBUTION : Definition, Mean and Standard deviation, Recurrence relation, Applications, Fitting of binomial distribution.

POISSON DISTRIBUTION : Definition, Mean and standard deviation, Recurrence relation, Poisson Distribution is an approximation of Binomial distribution, Applications, Fitting of Poisson distribution.

NORMAL DISTRIBUTION : Definition, Normal curve, Mean and standard deviation, Median, Mode, Normal distribution applications.

UNIT - 5 **L-12**

SAMPLING METHODS : Population and sampling, Parameters and statistics, Types of sampling. Test of hypothesis and test of significance: Null hypothesis, Errors, Level of significance, Confidence Limits, Testing large samples, Sample distribution of proportion, T-distribution for small sample, difference between means of small sample, Chi square test for goodness of fit, Chi square test for test of independence.

16FT205 PRINCIPLES OF FOOD PRESERVATION

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	40	-	-	5	5

Course Description and Objectives:

This course deals with the basic principles involved in food preservation methods. The objective of this course is to provide students with the knowledge of basic food preservation principles and processing methods to control food spoilage and deterioration.

Course Outcomes:

The student will be able to:

- understand fundamental principles of food spoilage.
- gain knowledge about different preservation techniques.
- understand the impact of various preservatives on safety and quality parameters of food products.

SKILLS:

✓ *Identify appropriate processing and preservation method for a given food.*

✓ *Identify and suggest suitable food additive for a given food product.*

✓ *Troubleshoot problems related to food safety during food processing.*

ACTIVITIES:

- *Prepare a table with different foods and their preservation methods.*
- *Report on permissible limits for various food additives as per regulatory standards.*

UNIT - 1 **L-9**

INTRODUCTION: Scope of food processing, Historical developments, Principles of food preservation, Preservation by physical methods and chemical methods.

UNIT - 2 **L-9**

FOOD PRESERVATION BY LOW TEMPERATURE: Processing, Preservation by low temperature, Refrigeration, Freezing, Freezingcurve, Changes occurring during freezing, Types of freezing, Thawing and its effects.

UNIT - 3 **L-9**

FOOD PRESERVATION BY HIGH TEMPERATURE: Sterilization, Pasteurization, Blanching, and UHT processing, Canning: different unit operations involved, Canning-equipment, Types of canning containers.

UNIT - 4 **L-9**

FOOD PRESERVATION BY NON-THERMAL METHODS: Processing, Preservation by: Irradiation, Dielectric heating, High pressure processing, Pulsed electric field, Hurdle technology, Ohmic heating.

UNIT - 5 **L-9**

FOOD PRESERVATION BY FOOD ADDITIVES: Definition, Types, Functions, Permissible limits and Safety aspects.

TEXT BOOKS:

1. J. P. Fellows, “Food Processing Technology, Principles and Practices”, 2nd Edition, Wood Head Publishing, 1999.

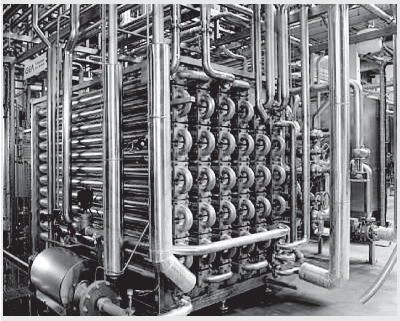
16FT206 FUNDAMENTALS OF HEAT AND MASS TRANSFER



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	30	25	45	-	5	5	5

Course Description and Objectives:

This course deals on imparting fundamental understanding on the phenomena of heat and mass transfer. The objective of this course is to train students on principles of heat and mass transfer, methodologies for determining the rate of heat and mass transfer and perform heat exchanger design calculations.

Course Outcomes:

The student will be able to:

- understand the basic laws of heat and mass transfer.
- account for the consequence of heat transfer in thermal analyses of engineering systems.
- analyze problems involving steady state heat conduction in simple geometries.
- obtain numerical solutions for conduction and radiation heat transfer problems.
- understand the fundamentals of convective heat transfer process.
- know about the basic mechanism behind boiling and condensation processes.
- analyze heat exchanger performance by using the method of log mean temperaturedifference.
- calculate radiation heat transfer between black body surfaces.
- understand the basic principles of mass transfer.

SKILLS :

- ✓ *Estimate the rate of heat flow through a wall, cylinder or sphere.*
- ✓ *Insulation thickness estimation.*
- ✓ *Determine heat transfer coefficients.*
- ✓ *Estimate double pipe heat exchanger length required for specified conditions*
- ✓ *Perform basic calculations required for heat exchanger design.*
- ✓ *Select the correct type of heat exchanger required for a specific process.*
- ✓ *Determine the emissivity of a body.*

ACTIVITIES:

- *Mix the heat*
- *Feel the heat*
- *Effect of radiation on test tube filled with water.*
- *Window Insulation*
- *Connecting shell and tube heat exchanger setup.*
- *Feel the fragrance*
- *Calculate critical thickness*
- *Design of double pipe heat exchanger*
- *Design of shell and tube heat exchanger*
- *Design of evaporator for fruit juce concentrate*

UNIT - 1 **L-9**

HEAT TRANSFER AND ITS APPLICATIONS: Nature of heat flow, Conduction, Convection, radiation, Heat transfer by conduction: Fourier's Law, One dimensional heat flow through slab/cylinder/sphere derivation, Concept of electrical analogy, Thermal resistance, Heat flow through composite wall/cylinder and sphere, Thermal contact resistance, Composite wall/ sphere/cylinder connected in series and parallel.

UNIT - 2 **L-9**

CONVECTION: Concept of overall heat transfer coefficient, Critical thickness of insulation, Heat transfer through extended surfaces, Application of fins, General fin equation, Effectiveness and efficiency of fins. Dimensional analysis, Rayleigh's and Buckingham pi theorem, Dimensionless number, Heat transfer by convection, Concept of thermal boundary layers, Heat transfer by forced convection in laminar and turbulent flow, Natural convection principle, Important correlations in forced and natural convection.

UNIT - 3 **L-9**

HEAT EXCHANGER: Applications of correlation to determine heat transfer coefficients in free and natural convection, Heat exchange equipment, Counter currents and parallel currents flows, Energy balances, Rate of heat transfer, LMTD, Individual heat transfer coefficient, Overall heat transfer coefficient, Fouling factors, Shell and tube and plate heat exchangers, Heat exchanger design, Application of different types of exchangers in dairy and food industry.

UNIT - 4 **L-9**

BOILING AND CONDENSATION: Boiling heat transfer, Types of boiling, Pool boiling of liquid, Critical heat flux concept, Pool boiling of saturated liquids, Film boiling, Condensation heat transfer: Drop wise and film type condensation, Radiation: Heat radiation, Emissivity, Absorptivity, Transmissivity, Radiation through black and grey surfaces, Determination of shape factors, Combined heat transfer by conduction, Convection and radiation.

UNIT - 5 **L-9**

MASS TRANSFER: Introduction, Fick's law of diffusion, Steady state diffusion of gases and liquids through solids, Equimolar counter diffusion, Isothermal evaporation of water into air, Mass transfer coefficient, Qualitative discussion on various mass transfer operations: Drying, Humidification, Distillation, Liquid extraction, Leaching and Adsorption.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Determination of heat transfer coefficient by natural convection.
2. Determination of overall resistance in composite wall.
3. Emissivity measurement.
4. Determination of thermal conductivity of metal rod.
5. Determination of heat transfer coefficients of double pipe heat exchanger.
6. Determination of critical heat flux points of Nichrome Wire.
7. Shell and Tube heat exchanger.
8. Liquid-liquid diffusivity experiment.

9. Surface evaporation experiment.
10. Gas-diffusivity measurement experiment.

TEXT BOOK:

1. R. K .Rajput, “Heat and mass transfer”, S. Chand and Co. Ltd, 2008.

REFERENCE BOOKS:

16FT207 UNIT OPERATIONS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
25	45	-	5	5	5

Course Description and Objectives:

This course deals with the principles and practices of unit operations involved in process industries. The objective of this course is to impart knowledge to students on engineering concepts of unit operations and processes.

Course Outcomes:

The student will be able to:

- understand the basic methods of characterization of particles and bulk solids.
- know basic principles of various unit operations.
- identify the range of equipments used to perform each major unit operation.
- gain knowledge on different drying techniques and their effect on food quality.

SKILLS:

- ✓ *Perform cumulative and differential particle size analysis.*
- ✓ *Identify the suitable mixer required for mixing cohesive and non cohesive solids.*
- ✓ *Recognize the required specifications of the size reduction equipment for a given feed.*
- ✓ *Identify the filtration equipment required for a specific application.*
- ✓ *Compare the efficiency of separation, size reduction, mixing and drying equipments.*

UNIT - 1 **L-9**

PROPERTIES AND CHARACTERIZATION OF SOLIDS: Properties, Handling and Characterization of particulate solids, Properties of particulate masses, Storage and mixing of solids, Mixers for cohesive and non-cohesive solids, Transportation of solid particulate mass, Belt, Screw, Apron conveyers, Bucket elevators, Pneumatic conveying.

UNIT - 2 **L-9**

PRINCIPLE OF COMMINUTION: Laws of Size reduction - Rittingers Law, Kicks law, Bondscrushing law, Work index, Problems, Classification of size reduction equipment : Crushers, Grinders, Ultra fine grinders, Cutting machines, Problems.

Industrial Screening: Different types of screening equipment in industries, Screen efficiency.

UNIT - 3 **L-9**

FILTRATION: Classification of filters based on nature of filtration and external force, Principles of cake filtration, Specific cake resistance, Filter-medium resistance, Types of membranes, Permeate flux, Concentration polarization, Micro filtration.

SEPARATION TECHNIQUES: Separations based on motion of particles through fluids, Gravity settling, Centrifugal settling, Sink and Float method, Flotation, Flotation agents.

UNIT - 4 **L-9**

AGITATION AND MIXING OF LIQUIDS: Agitation equipment, Impellers, Propellers, Paddles, Turbines, Power consumption in agitated vessels.

Crystallization: Crystal geometry, Principles of crystallization, Nucleation, Types of nucleation.

UNIT - 5 **L-9**

DRYING: Psychrometry, Humidification and dehumidification operations, Drying theory: thin layer drying, Deep bed drying, and types of dryers.

Leaching: Leaching principles, Leaching process with examples.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Determination of particle size using screen Analysis.
2. Finding the effectiveness of a screen.
3. Verification of size reduction laws using Jaw Crusher.
4. Verification of size reduction laws using Ball Mill.
5. Verification of size reduction laws using Roll Crusher.
6. Determination of compressibility coefficient using sedimentation process.
7. Determination of filter Medium resistance and cake resistance using plate and frame filter press.
8. Determination of percent recovery of coal from coal-sand mixture using Froth Flotation cell.
9. Determine the efficiency of cyclone separator.
10. Drying characteristics of food material.

ACTIVITIES:

- *Comparing the working of different types of crushers*
- *Finding the optimum time of sieving*
- *Comparing the working of leaf filter and plate and frame filter press.*

FT301 LEGUME AND OIL SEED TECHNOLOGY

Course Description & Objectives:

This course will impart knowledge to the students on Legume and Oil Seed Processing.

By the end of the course students will be able to develop good expertise on the technical aspects of dhal milling, oil milling and various legumes and oil seeds based product preparations.

Course Outcomes:

By the end of the course, the students will be able to

1. *Know about different pulses processing aspects and preparation of products with pulses*
2. *Learn about different oil seeds, oil milling by expellers, solvent extraction of oils, refining of oils and utilization of oil seed meals for different food uses.*

UNIT I - Pulse Classification and Processing

Present status and future prospects of legumes - Current trends in area, production and yield – TechnologyMission on Oil seeds and Pulses (TMOP). Morphological description of pulses. Classification and typesoflegumes - Chemical composition and nutritional Value. Anti-nutritional factors in pulses and their chemistry - Methods of removal of anti-nutritionalfactors. Processing of legumes - Milling, Soaking, Germination, Fermentation, Roasting and Parching, Extrusion, Parboiling and Agglomeration. Physical and chemical changesduring the processing of legumes

UNITII - Milling of Pulses

Dehulling of pulses - Advantages - Methods of dehulling - Traditional and modern methods of dehulling. Dehulling pretreatments - wet treatment, soaking, chemical treatment, dry treatment, oil treatment and heattreatment. Seed characteristics that affect dehulling - Nature of seed coat and physical characteristics of grains.Storage of pulses - Insect control measures in pulses. Milling of pulses - Wet milling and dry milling- Commercial milling of pulses by traditional methods. Dry milling of Tur, Black gram, Bengal gram, Wet milling of Tur - Modern CFTRI method of pulse milling

UNIT III - Pulse's Value Added Product

Dhal milling equipment and effect on quality - Principal products. Fermented products of legumes - Idli, Dosa,Soya curd(Tofu), Textured Vegetable Protein (TVP), Soya sauce, Tempeh, Natto and Miso. Cooking quality ofdhal - Factors affecting cooking quality of dhal and Legumes – Processed legume products - Puffed chick peaand Peas, Canned dry pea. Quick cooking dhal and instant dhal - Uses of pulses - Role of pulses in cookery –Medicinal value of pulses. Present status and future prospects of oil seeds - Annual oil crops, Perennial oil seedplants and Minor oil seeds - Chemical composition and characteristics of oil seeds and oils. Anti-nutritionalfactors in oil seeds -

UNIT IV- Post-Harvest Technology of Oil Seeds

Post-Harvest Technology of oil seeds - Handling- Drying and Storage - Grading – Pretreatments - Cleaning -Dehulling - Size reduction - Flaking - Heat treatment. Oil extraction - Rendering - Traditional methods - Ghani -Power ghanis - Hydraulic Press- Expellers - Principle and structural design of expeller. Solvent extraction process - Principle - Pretreatment - Breaking - Cracking - Flaking - Extraction principles - Factors affecting theextraction process - Desolventisation. Processing of oil seeds - Production and refining of cotton seed oil -Mechanical expression of cotton seed oil - Refining of crude cotton seed oil. Solvent extraction of soya bean oil- Sunflower oil - Palm oil - Coconut oil. Utilization of rice bran - Stabilization of rice bran - Dry heat treatment - Wet heat treatment. Extraction of rice bran oil - Solvent extraction - batch and continuous methods

UNIT V- Refining of Oils

Refining of oils - Degumming - Neutralization - Bleaching - Filtration – Deodorization - Winterization -Principles and process controls. Refining of crude bran oil into edible oil - Uses of bran and bran oil. Hydrogenation - Products based on hydrogenated fats -Margarine - Shortenings – Salad oils - Vanaspati – Saladdressings - Rancidity in fats and oils - Types of rancidity - Tests for rancidity. New technologies in oil seed processing. Utilization of oil seed meals for different food uses . High protein products - Protein concentrates - Protein isolates

FT303 CEREAL PROCESSING

Course Description & Objectives:

This course will impart knowledge to the students on cereal and millet processing.

By the end of the course, the students will be able to understand traditional and improved methods of cereal processing and to develop good expertise on the technical aspects of preparation of cereal and millet based products.

Course Outcomes:

By the end of the course, the students will be able to

1. *Know about different cereals and millets and their processing aspects*
2. *Acquaint with knowledge on utilization of by-products from cereals, preparation of ready to eat breakfast cereals and instant cereal foods*

UNIT I - Cereal and Millets

Present status and future prospects of cereals and millets - Current trends in area, production and yield. Structure ofcereals - Wheat, Corn, Rice, Barley, Oat, Rye and Sorghum. Composition and nutritive value of cereals. Physico - chemical properties of cereals, major and minor millets - Bulk density, true density, Porosity, Sphericity,Roundness, 1000 grain weight, Coefficient of friction and Angle of repose. Thermal properties - Specific heat -Thermal Conductivity - Thermal diffusivity. Theory of grain drying - Thin layer drying - Moisture content -Moisture measurement -Direct and indirect methods

UNIT II - Rice Processing

Equilibrium moisture content (EMC) - Determination of EMC - EMC models - Hysteresis - Bound, unbound andfree moisture. Drying curves - Constant rate period and falling rate period - Deep bed drying - Problems on moisturecontent. Methods of grain drying - Conduction, Convection, Radiation, Dielectric, Chemical and Sack drying. Graindryers - Unheated and heated air dryers - Batch and continuous type - Flat bed type - PHTC type - Columnar type -LSU type - Baffle type - Rotary type. Paddy and its handling - Cleaning - Drying - Cracking of paddy during dryingand its prevention - Methods of paddy drying - Sun drying and mechanical drying. Rice milling - Traditional ricemilling machinery - Engelberg huller, Huller mill, Battery of hullers, Sheller cum huller mill, Sheller mill, Shellercum cone polisher mill. Modern rice milling process - Cleaning, Dehuskinga, Husk separation, Paddyseparation,Polishing and Grading operations and their related equipment. Advantages and disadvantages of millingmachineries - Factors that affect rice out turn during milling. By-products of rice milling - Rice bran, rice hulls,broken grains, rice pollards. Parboiling of paddy and its principle - Physico - chemical changes during parboiling –Steps in parboiling - soaking, steaming and drying

UNIT III - Methods of Rice Processing

Effect of parboiling on milling, nutritional and cooking quality of rice. Advantages and disadvantages of parboiling.Methods of parboiling of paddy - Traditional methods- Atapa, Balam, Josh, Sela and Siddhaprocesses. Parboiling -single boiling and double boiling methods - Improved methods - CFTRI method- Schule process - Crystal riceprocess. Rice conversion process - Jadavpur University method - Malek process - Rice Growers Association ofCalifornia process - Avorio process. Fernandes process - IRRI process - True continuous parboiling process –RPECmethod. Sodium chromate method - Brine solution method - Kisan continuous parboiling method –Pressureparboiling method.

UNIT IV- Rice Value Added Products

Ageing of rice - Enrichment of rice. Rice fortification - Methods of rice fortification. Processed products from rice -Rice flour - Parched rice - Puffed rice - Flaked rice – Ricestarch - Instant rice - Canned rice. Wheat - Types of wheat -Wheat quality and grading. Wheat flour milling -Components of a wheat mill.

UNIT V- Milling Of Corn

Corn dry milling and wet milling - Products of corn milling. Milling of Barley, Oats and Rye. Milling of Sorghum, Bajra, Ragi - Their food uses. Malting of cereals - Uses of malt. Breakfast cereal foods – Flaked breakfast cereals, puffed breakfast cereals, shredded and granular breakfast cereals and cereals puffed by extrusion

TEXT BOOKS:

FT305 FRUIT AND VEGETABLE PROCESSING

Course Description & Objectives:

This course will train the students in the field of Fruit and Vegetable Processing. This courses will enable the students to learn different preservation techniques to curb post-harvest losses in the field of agriculture.

Course Outcome:

By the end of the course, the students will be able to

Learn processing of fruits & vegetables - different preservation techniques to improve the shelf life of seasonal fruits

UNIT I- Introductionto Fruit and Vegetable Processing

Production and processing scenario of Fruits and vegetables in India and world-scope of fruit and vegetable processing industry in India - present status, constraints and prospective. Overview of Principles ofpreservation - Drying /dehydration - process - types – pretreatments required - factors affecting rate of dehydration -Reconstitution - coefficient of rehydration. Freezing - process - types of freezing-changes during cold storage - thawing;Canning of fruits and vegetables - process - unit operations Concentration - types of concentration - changes duringconcentration. Chemical preservation - different types of chemicals used in processing of fruits and vegetables -Preservation by Sulphur dioxide and Sodium benzoate-safe limits of usage . Hurdle concept - Intermediate moisturefoods. Irradiation - process - principle and application in fruit and vegetable Industry - safe dosesof usage

UNIT II- Value added products from fruits and vegetables and their processing

Processing Technology of Jam - What is Jam? - Ingredients and their role in quality of Jam - Processing of Jam(flowcharts) - Tests for end point determination-Problems in Jam making. Pectin - properties -theories - Olsen's theory, Spencer's theory, Hinton's theory, Fibril theory. Jelly and Marmalades - Jelly –Differencebetween Jam and Jelly - Processing of Jelly – End point determination - Failure of Jellies to set- Cloudy or foggy Jellies -Formation of crystals - Syneresis. Marmalades - What is a marmalade? - Types - Jam marmalade - Jelly marmalade –Problems in marmalade making. Fruit preserves and candied fruits - What are fruit preserves? - Preparation of fruitpreserves - problems in making; candied fruits - Preparation of candied fruits; Glazed fruit - preparation. Glazed fruit -preparation, Crystallized fruit - preparation-problems in preparation of preserves and candied fruit. Chutneys -Preparation of chutney; Pickles - Types of Pickling-Pickling with salt – Dry salting - Brining. Pickling with Vinegar andfermentation - Sauerkraut - Role of lactic acid bacteria in pickling;

UNIT III- Fruit Beverage

Pickling with oil - pickling with mixture of salt, oil and spices - Problems/ spoilage in Pickles. Sauces and Ketchups -What are sauces? - Difference between sauce and a ketchup - classification of sauces-thick and thin sauces- processing ofTomato sauce/ketchup -Preparation of soya sauce(thin sauce) - problems in making of sauces**.** Processing Technology ofFruit Beverage - Unit operations involved in preparation of fruitbeverage. Equipment used in the preparation of beverages - pulping - Screw type juice extractors -Burring machines-rollers-Taglith press by CFTRI. Basket press - Rack and cloth press-Hydraulic press - Deaerators -Seitz filters – Flash pasteurizers**.** Types of Beverages - Processing technology of Beverages - Flow charts of Juice – examples- RTS – Nectar.

UNIT IV-Fruit Beverage: Standard and Specification

Processing of Beverages like Cordial, Squash, and Crush - FPO Specification –Processing method - Ingredients Flow Charts. Processing of Syrups - natural and synthetic- rose syrup -almond syrup- fruit syrup. Fruit juice concentrate - Fruit juice powder - Lemon Barley water - Carbonated beverages. Processing technology ofFruit Cheese - Processing of fruit cheese - guava cheese - Processing of Fruit leather - mango leather. Fruit toffee - preparation of banana toffee - Processing of Fruit Butter. Processing technology of vegetable wafers - potato wafers - preparation - types of peeling- discolorations - slicing - Drying - Frying - Salting - packing. Vegetable Papads - Processing of Papads - preparation -equipment used for preparation -Packing

UNIT V- Fruit Fermentation

Processing of Soups - preparation of tomato soup-packing/canning - preparation of souppowders - technology and equipment required. Fermented products from fruits and vegetables - Vinegar – typesofvinegar - methods of vinegar production - Quick method - Orleans slow process - Generator process – problems invinegar production. Fermented fruit beverages - Wine - types of wines - equipment required - preparation – problems.Sparkling clear wines - Champagne and Cider; Fortified wines - Sherry, vermouths; orange wine, Perry, Tokay, Port.

Cashew wine/ Brandy (Feni), Neera, Toddy, Arrack and different distilled spirits – their source and alcohol percentages

TEXTBOOKS:

FT307 BAKERY AND CONFECTIONERY PRODUCTS

Course Description & Objectives

This course will train the students in Bakery & Confectionery sector of food processing.

By the end of the course, the students will have knowledge about different raw materials used and their role and different equipment, processing of different Products and their packaging & Quality maintenance.

Course Outcomes:

By the end of the course, the students will have

1. Knowledge in the areas of Bakery and Confectionary product processing

UNIT I- Introduction to bakery and confectionary

History of Bakery and Confectionery - Present Trends - Prospects - Nutrition facts of Bakery& Confectionery goods. Raw materials used in Bakery - Flour - Types of flour - Flour characteristics - Water -Sources - Functions - Usage of Water; Salt - Role of Salt. Yeast, Yeast Production - Enzymes - their functions indough. Sugar and Milk - Properties and Role of milk and Sugar in Bakery. Leavening agents - What are leaveningagents? - Different Leavening agents - their functionsin Baking Industry. Spices used in baking and their functions; flavoring - Nuts and fruits - their function in breadmaking.

UNITII- Unit operation in bakery and Setting up bakery industry

Food colors; Setting materials - types - their function in baking; Cocoa and Chocolate. Bakery unit operationsincluding mixing - fermentation - Proofing - baking. Formula construction and computation of yeast raised products; types of breads, bread faults and remedies. Biscuits - Ingredients - Types of biscuits - Processing of biscuits - faults&Remedies. Cream crackers, soda crackers, wafer biscuits & matzos, puff biscuits. Hard sweet, Semi Sweet andGaribaldi fruit sandwich biscuit. Short dough biscuits, Wafers. Cakes - types - Ingredients - Processing of cakes -Problems - Remedies. Pizza and pastries - their ingredients and Processing. Setting up of a Bakery Unit – Bakeryequipment required - types - Selection – Maintenance- Bakery norms and Standards. Types of confectionery - Basic technical considerations of confectionery - TSS, pH,Acidityand ERH.

UNIT III- Bakery Raw Materials

Raw materials - types of sugar, granulated, caster, liquid brown sugars, molasses, microcrystalline sugars - their role in confectionery. Alternative bulk sweeteners - Glucose, fructose, lactose, sugar alcohol,sorbitol, xylitol,Isomalt, poly dextrose - their role in confectionery. Enzymes - used in syrup production - used in gelling –enzymesused in whipping. Agar-agar, Alginates, carrageenan, Gelatin, Acacia gum - Gum Arabic, Pectin, tragacanth,Xanthan gum, Egg albumen and Gelatin as a whipping agent. Milk protein, soya protein, oils, fats related productsand their role in confectionery. Food colors&flavors.

UNIT IV- Chocolate Processing

Chocolate processing - Different steps involved in chocolate processing - Ingredients, mixing refining. General technical aspects of Industrial sugar confectionery, composition effects, and changes, of state. Boiled sweets -

classification - Ingredients used in the preparation - Caramel, toffee andfudge - Processing. Processing of liquorice paste, cream paste and aerated confectionery products - Ingredients- theirfunction - Ingredients and Processing

UNIT V- Confectionery products and Quality Standards

Tablets, Lozenges, Sugar panning tablets, granulated confectionery, medicated confectionery - Ingredients andProcessing. Chewing gums, fondants, Marzipan - Ingredients & Processing. Crystallized confectionery - Processing -Ingredients and their functions. Quality and standards/ Regulations to be followed in the Bakery Industry andpackaging requirements. Quality and standards/regulations to be followed in the confectionery Industry andpackaging requirements

TEXT BOOKS

1. US wheat Associates .Baker’s Handbook on Practical Baking
2. John Kingslee .A Professional Text to Bakery and Confectionery. New Age International, NewDelhi. EBJackson. Sugar Confectionery Manufacture. Aspen Publications

FT309 REFRIGERATION ENGINEERING AND COLD CHAIN
(ELECTIVE - I)

Course Description & Objectives:

This course will impart basic knowledge of refrigeration process and equipment. By the end of the course students will be able to understand the refrigeration processtheir application in processing and increasing shelf life of food, also to make students aware of cold chain design and storage.

Course Outcomes:

By the end of the course students will be able understand

1. *Refrigeration and air-conditioning, types, properties and working of refrigerants.*

2. *Vapour compression cycle and different types of evaporators.*
3. *Different types of evaporators and their advantages and disadvantages.*
4. *Processing of fruits and vegetables, meat products etc. by freezing and quality changes during freezing.*

UNIT I- Refrigeration and air conditioning

Definition of refrigeration and air conditioning - Necessity of refrigeration and air conditioning - Factors affecting comfort air conditioning. Definition of Refrigerant - History of refrigerants - Classification of Refrigerants – Primary Refrigerants - Secondary Refrigerants - Halo carbon refrigerants. Azeotrope refrigerants - Inorganic refrigerants - Ammonia - Air - Cabon dioxide – Sulphur dioxide - Water. Hydro carbon refrigerants - Designation system for refrigerants. Desirable properties of an ideal refrigerant - Selection of a refrigerant. Thermodynamic properties of refrigerants.

UNITII- Refrigerators& Refrigerants

Chemical requirements of refrigerants - Physical properties of refrigerants. Secondary refrigerants -Brines. Types of Refrigerators - Air Refrigerator - Vapour refrigerator - Advantages and Disadvantages of Vapour compression refrigeration system over air refrigeration system. Mechanism of a simple Vapour compression refrigeration systems. Evaporators - Capacity of an evaporator - Factors affecting heat transfer capacity of an evaporator - Types of evaporators. Bare tube coil evaporator - Finned evaporator - Plate evaporator - Shell and tube evaporator.

UNIT III- Evaporator

Shell and coil evaporator - Tube in tube evaporator - Flooded evaporator - Dry expansion evaporator. Natural convection evaporator - Forced convection evaporator - Frosting evaporators – Non Frosting evaporators - Defrosting evaporators. Compressors - Classification - Suction pressure, Discharge pressure, Compression ratio, Suction volume, Stroke volume, Clearance factor, Compressor capacity, Volumetric efficiency. Reciprocating compressors - Parts of a reciprocating compressor - Cycle of a reciprocating compressor. Rotary compressor - Centrifugal compressor - Advantages and disadvantages of a centrifugal compressor.

UNITIV- Condensers

Condensers - Working of a condenser - Factors affecting the condenser capacity – Heat rejection factor. Classification of condensers - Air cooled condensers - Water cooled condensers - Tube in tube condenser - Shell and coil condenser. Fouling factor - Differences between air cooled and water cooled condensers – Evaporative condenser. Expansion Devices - Types of expansion devices - Capillary tube. Hand operated expansion valve - Low side float valve - High side float valve. Ice manufacture - principles of ice production. Applications of refrigeration in different food products.

UNIT V- Freezing

Food Freezing - Freezing systems - Indirect contact systems Plate Freezers - air blast Freezers - Freezers for liquids foods. Direct contact systems - Air blast - Immersion. Frozen food properties - Density – Thermal conductivity - Enthalpy - Apparent specific heat- Apparent thermal diffusivity. Freezing time – Factors influencing freezing time - Freezing rate - Thawing time. Quality changes in foods during frozen storage.

FT311 ENGINEERING PROPERTIES OF FOOD MATERIALS
(ELECTIVE - I)

Course Description & Objectives:

This course will impart knowledge about the various properties of food and their handling and storage

By the end of the course students will be able to understand physical, chemical and mechanical properties of food and their handling and storage.

Course Outcomes:

By the completion of the course students will be able to understand

1. Engineering properties of food and biomaterials.

2. Structure and chemical composition of foods, Physical properties.
3. Water activity, food stability sorption and desorption isotherm of food materials.
4. Newtonian and non-Newtonian fluid.
5. Thermal properties and Electrical and magnetic properties of food.
6. Aero- and hydrodynamic characteristics, application of frictional properties in grain handling, processing and conveying.

UNIT I- Introduction to engineering properties of food

Introduction to engineering properties of food and biomaterials, Structure and chemical composition of foods, Physical properties (size, shape, surface area, volume, density, sphericity, porosity, specific gravity, color), Properties of powdery materials.

UNIT II-Moisture and water activity

Moisture in food and biological materials. Water activity, food stability sorption and desorption isotherm of food materials.

UNIT III- Mechanical properties of food

Mechanical properties (strain and stress), viscosity, elasticity, visco-elasticity, Newtonian and non-Newtonian fluid, time dependent fluids, creep and relaxation phenomena, texture profile.

UNIT IV- Thermal properties of food

Thermal properties (specific heat capacity, thermal conductivity, and thermal diffusivity), Convective heat transfer coefficient, Cooling and phase change. Electrical and magnetic properties.

UNIT V-Friction and grain handling

Friction of solids and flow of granular solids, angle of repose, coefficient of friction, Aero- and hydrodynamic characteristics, application of frictional properties in grain handling, processing and conveying.

FT313 NOVEL FOOD PROCESSING TECHNIQUES
(ELECTIVE - I)

Course Description & Objectives:

This course will impart knowledge about the advanced technologies in food processing.

By the end of the course students will be able to understand the advanced technology in food processing and their importance in food safety and quality and shelf life stability.

Course Outcomes:

By the end of the course students will be able to understand

1. High Pressure Processing, equipment and application in food
2. Pulsed electric fields processing, equipment and application in food
3. Osmotic dehydration and application in food
4. Ultrasound processing and application in food
5. Microwave heating, Radio-frequency processing: dielectric heating, radio-frequency heating; Ohmic heating, Freeze drying, freeze concentration, UV radiation

UNIT I- High Pressure Processing and Hurdle Technology

High Pressure Processing: Principles of high pressure processing, Effects of high pressure on food quality: Pressure effects on microorganisms, texture and nutrients of food. Hurdle Technology Concept; effect on preservation of food.

UNIT II-Pulsed electric fields processing of food

Pulsed electric fields processing: PEF treatment systems, main processing parameters. Mechanisms of action: mechanisms of microbial inactivation.

UNIT III- Osmotic dehydration and Membrane separation

Osmotic dehydration: mechanism of osmotic dehydration, application of osmotic dehydration.

Membrane separation: Principle, different types of Membrane processing, Application in Food industry

UNIT IV- Ultrasound processing of food

Ultrasound processing: fundamentals of ultrasound, ultrasound as a food preservation and processing aid, effects of ultrasound on food properties.

UNIT V- Thermal processing of food

Alternate thermal processing: Microwave heating, Radio-frequency processing: dielectric heating, radio-frequency heating; Ohmic heating, Freeze drying, freeze concentration, UV radiation

FT315 CEREAL PROCESSING LAB

Course Description & Objectives:

This course will impart knowledge to the students on cereal and millet processing.

By the end of the course, the students will be able to understand traditional and improved methods of cereal processing and to develop good expertise on the technical aspects of preparation of cereal and millet based products.

Course Outcomes:

By the end of the practical exercises, the students will be able to

1. Develop skills on cereal processing aspects.
2. Determine the physical properties of cereals and millets.
3. Learn about preparation of ready to eat cereal products.

LIST OF EXPERIMENTS

1. Study of morphological characteristics of cereals
2. Determination of physical properties of cereals
3. Determination of colour of cereals
4. Determination of moisture content of cereals
5. Experiment on parboiling of paddy
6. Cooking quality studies of rice
7. Experiments on rice shelling and polishing
8. Processing of pop corn
9. Processing of puffed rice
10. Processing of flacked rice
11. Processing of cereal and millet malts
12. Visit to a commercial cereal processing unit.

III Year B.Tech. Food Tech. I-Semester

L	T	P	To	C
-	-	3	3	2

FT317 FRUIT AND VEGETABLE PROCESSING LAB

Course Description & Objectives:

This course will train the students in the field of Fruit and Vegetable Processing. This courses will enable the students to learn different preservation techniques to curb post-harvest losses in the field of agriculture.

Course Outcomes:

By the end of the course, the students will know the

1. processing of fruit & Vegetable products like Jams, Jellies, Squashes

LIST OF EXPERIMENTS

1 Preparation of Jams.
2. Preparation of Jelly and Marmalade.
3. Preparation of Preserves, Candies and Crystallized Fruits.
4. Preparation of Chutneys.
5. Preparation of Sauces, Ketchups.
6. Preparation of Fruit Squashes, Fruit Juices and RTS.
7. Preparation of Fruit nectar or Cordial or Crush.
8. Preparation of Wine and Vinegar.
9. Preparation of Carbonated Beverages.
10. Preparation of Fruit cheese and Toffee.
11. Preparation of Wafers and Papads.
12. Dehydration of Fruits and Vegetables.
13. Visit to Fruit and Vegetable Processing Industry.

FT319 BAKERY AND CONFECTIONERY PRODUCTS LAB

Course Description & Objectives

This course will train the students in Bakery & Confectionery sector of food processing.

By the end of the course, the students will have knowledge about different raw materials used and their role and different equipment, processing of different Products and their packaging & Quality maintenance.

Course Outcomes:

By the end of the lab, the students will

1. Gain skills in the areas of bakery and confectionery products - raw materials required, equipment required and quality of the baked products
2. Various test conducted for determining the quality of the flour.
3. Preparation of cookies, cake and other bakery products

LIST OF EXPERIMENTS

1. Study of different equipment used in Bakery and Confectionery
2. Estimation of Gluten
3. Determination of alcoholic acidity
4. Determination of falling number/amylase
5. Determination of Pelshenke value
6. Determination of sedimentation value
7. Preparation of bread by straight dough methods
8. Preparation of buns by sponge
9. Preparation of yeast dough products
10. Preparation of soda crackers
11. Preparation of Cakes and Cake decorations, cookies
12. Preparation of confectionery, candy, hard boiled candy, cotton candy
13. Preparation of chocolates
14. Visit to bakery and confectionery unit

III Year B.Tech. Food Tech. II - Semester

MS310 MANAGERIAL ECONOMICS

Course Description & Objectives:

This course provides students with the knowledge, tools and techniques to make effective economic decisions under conditions of risk and uncertainly.

Course Outcomes:

Students will be able to:

1. *Apply the economic way of thinking to individual decisions and business decisions*
2. *Understand how prices get determined in markets, how market participants benefit in the form of consumer surplus and producer surplus, and what are the consequences of government intervention*
3. *Understand the roles of managers in firms*
4. *Understand the internal and external decisions to be made by managers*
5. *Design competition strategies, including pricing, product differentiation, research & development, and marketing, according to the natures of products and the structures of the markets*
6. *Analyse real-world business problems with a systematic theoretical framework.*

UNIT I - Nature & Scope of Managerial Economics

Basic tools and techniques of Business Economics, Macro Economic Environment and Managerial decisions.

UNIT II – Demand Analysis

Demand Analysis: Types of Demand, Demand determination Concept of Elasticity and measurement, Demand forecasting, Survey & Statistical methods.

UNIT III – Theory of Production

Production function, Marginal rate of technical substitution, Iso-quants and Iso-costs, production function with one/two variable factors,Law of Variable Proportions, and Returns to Scale, internal and external economies.

UNIT IV – Cost Analysis

Cost concepts, cost determinants, cost output relationship in the short and long run, Break-Even analysis.

UNIT V - Features and types of different competitive situations

Perfect competition, Monopoly, Monopolistic competition and Oligopoly, pricing methods in practice.

TEXT BOOKS:

1. Gupta: Managerial Economics, 1/e TMH, 2005
2. A.R.Arya Sri, Managerial Economics and Financial Analysis, TMH, 2/e, 2010

REFERENCE BOOKS:

L	T	P	To	C
4	0	-	4	4

FT302 FOOD PACKAGING

Course Description & Objectives:

This course will impart knowledge about the need for Optimum Packaging of foods. By the end of the course students will have understanding of different packaging materials, and machinery used to protect food products and increase their shelf life.

Course Outcomes:

By the end of the course, the students will be able to know

1. *About different types of paper based packaging material*
2. *About different types of plastic based package material*
3. *About metal and glass based packaging material*
4. *About advanced packaging techniques and packaging* machinery.

UNIT I- Introduction to packaging

Introduction to the subject, packaging situations in world and in India - Packing is pervasiveand essential - Historical development of packing - ‘a package must protect what it sellsand sell what it protects’. Need of Packaging food - Logistics - Merchandising Outlets - Handling -Transportation - Packaging machinery - Technology upgradation - Public Distribution - Cost effectivepackaging.. Packaging requirements - Levels of Packaging - Packaging functions - Attractiveness -Protection - Convenience - Printability - Differentiability. Machinability - Environmental Impact - Low costcontainment - Communication – Resealing features - Non toxicity - Aroma retention. Hazards acting onPackage during transportation - Moisture impact - Light impact – Common insect pests - Changes in foodquality - Biological changes in food quality. Storage - Factors influencing - Shelf Life of fruits andvegetables - Atmospheric packaging - Respiratory Metabolism

UNIT II- Advanced packaging technology and Packaging laws and Regulations

Controlled Atmospheric Packaging Technology (CAP) - Modified Atmospheric PackagingTechnology (MAP) - Advantages of CAP and MAP - Effect of gases on MAP foods - N2, O2,CO2. Labeling Laws - Packaging laws and Regulations - SWMA Rules - PFA Rules - FPO Rule- MFPO Rules - Agmark Rules - Class ‘A’ commodities - Class ‘B’ commodities – MisbrandedLabeling rules for infant foods. National Standards on Packaging code for foodstuffs and Perishables -Classification of food stuffs according to the code - Decreasing order of their perishability - Milk and milkproducts. Fruits and vegetables - Meat, fish and poultry - Bakery rich foods - Protein rich foods -Edible starch and starch products - Oils and Fats - Food grains and food grain products - Sugar and Honey. Stimulant foods - Alcoholic drinks and carbonated beverages - Food Additives andSpicesand Condiments. Packaging materials - Classification of Packages - Paper as packaging material– Paper manufacture - Pulp - Mechanical pulp - Chemical pulping - Alkaline processes – Sodaprocess - Sulfate process - Sulfite process - Semi chemical pulping – Digestion

UNIT III- Manufacturing of Glass and Paper

Bleaching - Beating and Refining - Paper making - Converting - Calendaring – Strengthadditives - Sizing agents. Types of paper - Kraft paper - Bleached paper - Grease proof paper – Glassin paper -getable parchment Waxed paper. Paper Boards - Paper board grades - Folding Cartons – Kindsof carton boxes – BeverageCartons - Molded Pulp containers - Printing and varnishing - Die cutting andcreasing -Gluing and sealing. Glass as Package material - Composition of Glass - Basic parts of Glass container -Closures Parts of Closures - Types of Closures - Properties of glass - Internal pressureresistance - Vertical load Strength. Resistance to impact - Resistance to Scratches and Abrasions -Glass manufacture -Press and Blow (P&B) - Narrow Neck Press and Blow (NNPB) - Shape of glass Container.Improvements in glass manufacturing - Hot and Cold end treatment of surface – Inspectionof Glass - Advantages and Disadvantages. Metal as Packaging material - Introduction - Materials used inCan Manufacture – PropertiesManufacture of Tin Plate - Pig Iron - Steelmaking - Tin plating - Basic types of Metal Plate- Tin free steel (TFS)

UNIT IV- Manufacturing of aluminum cans and Plastics

Manufacture of ECCS- Aluminum Cans - Manufacture of Aluminum cans - Container -Advantages and Disadvantages. Making Processes - End Manufacture - Three Piece Can Manufacture -Welded Side seams Soldered Side seams - Double Seaming - Two Piece Can Manufacture. DWI Cans - DRD Cans - Protective and Decorative (Lacquers/ Enamels) - Aluminum foilsand Containers - Tubes - Retort Pouch - Corrosion of Metals. Plastic Consumption and use inWorldandin India - Plastic as packaging material .Classification of Plastics. Properties of Each Plastics - Uses andChemistry of Polyethylene (LDPE, HDPE, LLDPE, ULDPE). Polypropylene - Polystyrene -Polycarbonate - PVC - PVDC - EVOH - EVA - PVA - PET - Cellulose Acetate - Cellophane - Nylon -Plastic recycling . Laminations - Need of Laminations - Types of Laminations - Advantages andDisadvantages of each type - Coating on paper and films - Types of coatings - Need of Coatings –Methods of Coatings

UNIT V- Aseptic Packaging for food products

Aseptic Packaging - Need for Aseptic Packaging - Materials used in Aseptic PackagingProcess of Aseptic Packaging. Comparison of Conventional and Aseptic Packaging Aseptic PackagingSystem - Advantages. Machineries used in Food Packaging. Packaging of Specific Foods likeBread, Biscuits, Coffee, Milk Powder, and Egg Powder -Carbonated Beverages - Snack Foods.

Mechanical andFunctionalTests on Packaging, on Packaging boxes and on Packaging Materials - Thickness – BasicweightGrammage. Water Absorption - Burst Strength - Tear Strength - Puncture- Resistance TensileStrength- Grease Resistance - Gas Transmission Rate (GTR) -Water Vapour Transmission Rate(WVTR)

FT304 FOOD SAFETY AND MICROBIAL STANDARDS

Course Description & Objectives:

This course will impart the knowledge to students about Food safety and microbial standards.

By the end of the course students will be able to understand various Food safety and microbial standards and toxins both natural and synthetic used in food processing and Sanitation principles.

Course Outcomes:

By the end of the course, the students will be able to

1. *Understand about toxins from bacteria and fungi.*
2. *Know about different food additives, anti-nutrients, anti-vitamins used in food processing.*
3. *Understand about heavy metal contamination in foods.*
4. *Understand about food safety and microbial standardization.*

UNIT I-Food Spoilage

History of Food spoilage, Food poisoning, Food legislation and Food preservation. Dietarytoxins - Food poisoning, Intoxication, Infection, Classification of toxins. Food borne bacterial toxins - *Clostridium botulinum, Clostridium perfringens, Staphylococcus*- Types of food involved - toxicity and symptoms - Chemical properties – Environmental conditions Food borne bacterial toxins - *Salmonella, Vibrio, Escherichia coli*, five groups of *E.coli, Bacillus cereus.* Types of food involved - toxicity and symptoms - Chemical properties -Environmental conditions. Food borne bacterial toxins - *Listeria, Shigella, Yersinia, Campylobacter, Aeromonas,Brucella,*. Types of food involved - toxicity and symptoms - Chemical properties- Environmental condition. Mycotoxins - Types of mycotoxins - Aflatoxins, Patulin, Penicillic acid, Ochratoxin, citrinin, Alternaria toxin - Types of food involved - toxicity and symptoms - Chemical properties -Environmental conditions. Mycotoxins - Sterigmatocystin, Fuminosins, Sambutoxin, Zeralenone, Ergotism,Cyclopiazonic acid, Rubratoxin, Roquefortine - Types of food involved - toxicity and symptoms-Chemical properties - Environmental conditions.

UNIT II- Introduction to Mycotoxin and metal toxin

Mushroom toxins, Different species of poisonous mushrooms, Poisoning or disorders due to poisonous mushrooms. Control of mycotoxins in food and feed. Algal toxins - Paralytic shell fish poisoning, Ciguatera poisoning, , cyanobacterial toxins, Scombro toxic Fish poisoning, - Types of food involved - toxicity and symptoms - Chemical properties - Environmental conditions. Food borne animal parasites - Protozoans - Giardiasis, Amebiasis, Food borne animal parasites-Flat worms - Taeniasis, Round worms (Trichinosis, Anisakiasis) –Types of food involved - toxicity and symptoms - Chemical properties - Environmental conditions. Food borne viruses - Polio, Hepatitis A and Noroviruses, rota viruses, Prion Diseases - Types of food involved - toxicity and symptoms - Chemical properties –Environmental conditions. Metals as toxins - Heavy metals - Arsenic - Occurrence - detection in foods – Toxicological effects - limits - Cadmium - Occurrence - detection in foods - Toxicological effects – limits - Mercury - Occurrence - detection in foods - Toxicological effects - limits. Lead, Tin, Zinc, Aluminium, Chromium, Cobalt, Antimony - Occurrence - detection in foods - Toxicological effects – limits.

UNIT III- Pesticide and Antinutrients in food

Pesticides - Chlorinated pesticides and non-chlorinatepesticides - Decontamination of food commodities of their insecticide residues. Movement of Residues in the environment. Pesticides - Mechanisms of Toxicity-Residues in Food, Acceptable daily intakes, Maximum residue limits. Antinutrients - Toxic phenolic substances, Flavonoids, tannins, - Toxicity and symptoms – Chemical properties - Type of foods involved - Prevention. Antinutrients - Saffrole, Cyanogenic glycosides, Glucosinolates, favism, Lathyrism, Canavanine, Goitrogens, Caffeic acid &chlorogenic acid, Glycoalkaloids, Saponins. Anti-nutritive factors -Type Aantinutritives - antiproteins- Protease inhibitors - Lectins - Type B antinutritives - antiminerals - Phytic acid - Oxalic acid - Glucosinolates – Diteryfiber- Gossypol - Type C antinutritives - anti vitamins - Ascorbic acid oxidase – Antithiamine factors - Antipyridoxine factors. Anti-microbial agents - common anti-microbial food agents - Benzoic acid - Benzoates -Sorbic acid - Sorbates - Short chain organic acids - acetic acid - lactic acid – propionic acid - citric acid - parabens - sulfite - nitrite. Anti-microbial agents - Natural antimicrobial substances present in foods (Indirect antimicrobials) - Antioxidants, Flavouring agents, spices and essential Oils, phosphates, Medium chain fatty acids and esters, acetic and lactic acid. Anti-microbial agents - Antibiotics (, natamycin, tetracyclins, Subtilin, Nisin,), Antifungal agents for fruits, Ethylene and propylene Oxides

UNIT IV - Food safety and HACCP

Antimicrobial agents - Miscellaneous chemical preservatives - Chitosans, Dimethyl bicarbonate, Ethanol, Glucose oxidase, Polyamino acids. Bacteriophages as biocontrol agents, hurdle concept. Sanitation - GMPs - Personal hygiene - Sanitizers - Sanitation principles – Sanitizing methods - Sanitation agents - Chlorocompounds- Idocompounds - Bromcompounds – Acid and alkali compounds. Sanitation - Ozone, hydrogen peroxide, Acidified sodium chlorite- Factors influencing efficacy of sanitizers. Food safety- Indicators of food microbial Quality andsafety - Coliforms, Enterococci, Bifidobacteria, Coliphages/Enteroviruses, predictive Microbiology/ Microbial modeling. Risk assessment and management during food preparation - HACCP – prerequisite programmes, definitions, HACCP principles, Flow diagrams, Application of HACCP principles, Limitations of HACCP. Risk assessment and management during food preparation - Food safety Objective (FSO), Microbiological criteria, definitions, sampling plans. Microbiological criteria for various food products

UNIT V - Food laws & Standards

Food laws & Standards - FAO, Codex Alimentarius, ISO, Indian food laws and standards, Prevention of Food adulteration (PFA)act, Fruit Products Order(FPO), Meat product order (MPO), Cold storage order (CSO),BIS, Agmark.Non permitted food additives - Allura red AC, Aspartame, amaranth, Benzoic acid, brilliant black, Butylated Hydroxy - anisole, Calcium benzoate, Calcium sulphit. Non permitted food additives-Monosodium glutamate (MSG) Ponceau 4R, Cochineal Red A, Potassium benzoates, Potassium nitrate, Propyl p-hydroxybenozoate, propyl paraben, and paraben. Non permitted food additives - Saccharin & its Na, K and Ca salts, Sodium metabisulphite, Sodium sulphite, Stannous chloride (tin), Sulphur dioxide, Sunset Yellow FCF, Orange Yellow S, tartrazine.

FT306 PROCESSING OF MILK & MILK PRODUCTS

Course Description & Objectives:

This course will impart knowledge about the various technologies for milk processing. By the end of the course students will be able to understand various technologies for milk processing, processing equipment, Quality standards for dairy products and handling and storage of milk and milk products.

Course Outcomes:

1. *Understand and describe the inherent compositional variability of milk composition, both within and among species.*
2. *Describe the physico-chemical and functional properties of milk constituents (proteins, lipids, carbohydrates, minerals.*
3. *Understand and describe the structural constituents of milk (casein micelle, milkfat globule)*
4. *Understand the processing of various milk products*

UNIT I- Introduction to milk

Milk - Definition - Indian Standards - Composition - Milk Constituents - Food and Nutritive value of milk. Physico-chemical properties of milk constituents - Physico-chemical properties of milk. Colostrum and its nutritive value - Milk and Public health - Safe guarding the milk supply- Clean milk production - Buying and collection of milk - Cooling and transportation of milk. Effect of heat on milk. Manufacture, Packaging and Storage of Pasteurized milk- Receiving - Preheating - Filtration/ Clarification - Cooling - Storage of raw milk. Standardization - definition and procedure. Pasteurization - Definition - Objectives - Formulation of standards - Methods of Pasteurization- Batch method and HTST method.

UNIT II- Pasteurization of milk and milk products

Vacuum Pasteurization - Standardization - Ultra High Temperature Pasteurization - Uperization - Homogenization - Bottling and storage - Flavour defects in milk, their causes and prevention. Ultra filtration and Reverse Osmosis. Cream - Definition - Classification - Composition - Food and

Nutritive value – Physicochemical properties. Cream production - Gravity and Centrifugal methods. Factors affecting fat percentage of cream - Yield of cream - Collection of cream - Neutralization of cream. Pasteurization of cream - Manufacture of different types of cream - Defects in cream, their causes and prevention. Butter - Definition - Classification - Composition - Method of manufacture, packaging and storage - Butter Over run. Theories of churning - Continuous butter making - Defects in butter, their causes and prevention

UNIT III- Types of milk and milk products and their preparation

Butter oil - Definition - Composition - Nutritive value - Methods of manufacture, Cooling, Packaging, Storage and Distribution - Defects in butter oil, their causes and prevention. Special milks - Sterilized milk-Definition - Method of manufacture - Homogenized milk- Definition - Factors influencing homogenization-Method of manufacture - Homogenizer- Soft curd milk - Definition - Characteristics - Methods of preparation of soft curd milk. Flavoured milks - Definition - Types - Methods of manufacture of chocolate/fruit flavoured milks/drinks – Vitaminized/Irradiated milk - Frozen concentrated milk .Fermented milk - Merits - Types - Starter propagation - Natural butter milk – Cultured butter milk - Acidophilus milk - Bulgarian butter milk - Kumiss - Kefir. Yoghurt - Method of preparation - Flavoured yoghurt preparation - Standardized milk -Reconstituted milk - Recombined milk - Toned milk - Double toned milk - Humanized milk- Miscellaneous milks.. Cheese - Definition - Classification - Composition - Nutritive value - Manufacture of cheddar cheese - Curing of cheese

UNIT IV- Processing of indigenous milk products

Cottage cheese - Method of manufacture - Different varieties of cheese - Defects in cheese, their causes and prevention. Ice cream - Definition - Classification - Composition - Nutritive value - Role of constituents in ice cream - Method of manufacture, packaging, hardening and storage. Over run in ice cream - Defects in ice cream, their causes and prevention. Manufacture of indigenous milk products - Ghee, Khoa, Chhana - Method of manufacture, packaging and storage - Nutritive value. Paneer, Dahi and Shrikhand - Method of manufacture, packaging and storage.

UNIT V- Dairy industry and by-products

Methods of preparation of Kheer, Rabri, Kulfi and Lassi. Indian milk confectionery - Manufacturing, packaging and storage of Khoa based sweetsKalakhand and Gulabjamun. Manufacturing, packaging and storage of Chhana based sweets Sandesh and Rasogulla.. By-products of dairy industry - Classification - Principle and method of utilization. Casein (industrial) - method of manufacture - Defects - Uses - Casein (edible) - method ofpreparation – Uses.

FT308 PROCESSING OF MEAT AND POULTRY PRODUCTS
(ELECTIVE - II)

Course Description & Objectives:

This course will impart knowledge about the various technologies for meat and poultry processing.

By the end of the course students will be able to understand various meat processing technology and equipment, Quality standards for meat and poultry products and handling and storage of meat and poultry products

Course Outcomes:

By the end of the course students will be able to understand

1. *Sources and development of meat and poultry industries in India and importancein national economy.*
2. *Methods of slaughter - Stunning techniques - mechanical, electrical, chemical methods; Ritual/religious methods of slaughter - Jewish, Halal, Jhatka and Spanish methods.*
3. *Principles of various meat preservation techniques.*
4. *Safety standards in meat industry - Meat food product order - HACCP-ISO-9000 standards. Meat plant sanitation and hygiene.*
5. *Composition, spoilage, preservation and maintenance of eggs of eggs.*

UNIT I-Introduction to meat and poultry

Introduction: Sources and development of meat and poultry industries in India and importanceof meat and meat industries in national economy. Structure of meat muscle-microscopic view - Myofibrils - Actin - Myosin - Contraction. Chemical composition of meat muscle - muscle proteins - fats - carbohydrates - connective tissue-nutritive value of meat. Pre-slaughter care-requirements - different modes of transport of meat animal. Ante-mortem examination of meat animal; principles and judgements. Slaughtering of meat: Scientific methods of slaughter - Stunning techniques -

mechanical,electrical, chemical methods; Ritual/religious methods of slaughter - Jewish, Halal, Jhatka and Spanish methods. Dressing and cutting of carcass in sheep, pig and buffalo.

UNIT II-Post mortem changes in meat

Post mortem examination of carcass and principles of judgement. Grading of meat and packaging of meat Postmortem changes in meat - Rigormortis - Biochemical changes associated with Rigormortis which lead to the conversion of muscle to meat - Factors - Ph decline, resolution of rigor-autolytic proteolytic enzymes - microbial invasion and loss of structural integrity. Meat quality parameters - Meat color - Water holding capacity - Marbling - Quantum of connective tissue - firmness and storage conditions. Palatability characters of meat and factors affecting meat quality. Methods of tenderization - aging, enzymes and curing - factors affecting tenderness

UNIT III-Principles of various meat preservation techniques

Spoilage of meat - Sources of contamination, growth of microorganisms – Deteriorative changes in meat - Identification of spoilage. Principles of various meat preservation techniques - Chilling - Freezing- Curing – Smoking - Thermal processing - canning - Dehydration - Irradiation and Hurdle concept. Processing technology of meat products - Basic processing - Comminution – Mechanical deboning - Emulsification - Meat emulsion - methods of stabilization of meat emulsion meat extension - preblending - Hot processing - Cooking Techniques. Cured meats - Process of curing, methods of curing - commercial processing of ham and Bacon - Sausage processing - Production of Intermediate moisture and shelf stable meat products.

UNIT IV-Safety and quality standards in meat and poultry industry

Restructured meat products - tumbling - massaging - chunking - forming - tearing and forming. Value added meat products like luncheon meats - meat patties - meat loaves - meat balls and meat nuggets Safety standards in meat industry - Meat food product order - HACCP-ISO-9000 standards. Meat plant sanitation and hygiene. Structure of egg - different parts of an egg. Composition of egg - Proteins of Egg white, Yolk proteins and lipids and nutritive value of egg. Egg quality characteristics - Internal Quality - Haugh's unit - Terms indicating defective quality and Egg grading Ante mortem and post mortem examination of poultry birds - principles of judgement.

UNIT V-Spoilage and Preservation of eggs

Preslaughter care, handling, Transport and dressing of a poultry bird Cuts of poultry bird and Indian Standards of a dressed chicken. Microbial spoilage of eggs - types of spoilage in eggs - indications – organismscausing spoilage. Preservation and maintenance of eggs - Preservation of shell eggs - Egg cleaning – Oil Treatment - Cold storage - Thermo stabilization - Immersion in liquids. Preservation of Albumin and yolk-powder production. Preservation of poultry meat - Chilling, Freezing, Curing, Smoking, Dehydration, Canning and Radiation. Processing of value added products - Chicken barbecue, chicken sausage, meat balls and Pickling

FT310 FOOD INDUSTRY BY-PRODUCTS
(ELECTIVE - II)

***Course Description & Objectives**:*

This course will impart knowledge about waste minimization, utilizing and developing various techniques to get best out waste from various food industry. By the end of the course students will be able understand the various types of by-products of food industry and their minimization, effective and efficient management of waste

Course Outcomes:

By the completion of the course students will be able to understand.

1. *Various types of by products and waste generated by the food industry.*
2. *By-product utilization of Legume seeds and oil seed industry.*
3. *By-products of dairy industry, Classification, Principle and method of utilization.*
4. *By- products of vegetable and fruit processing Industry, pectin extraction from apple pomace - tartaric acid extraction - oxalic acid. Fruit pits-kernel oil production, Citrus oil production, wine and beer production.*
5. *By-products of meat, poultry and egg processing Industry.*

UNIT I-Introduction to food waste

Introduction to Industrial by - products and waste - Potentials and prospects of developing by-products Industry in India. Agricultural wastes and agro based industries - Types of By-products in agro – based industries - commercial compounds obtained from by-products. By-products of Cereals - by-products of cereals processing - Rice and corn milling byproducts, Husk Utilization

UNIT II- By-product utilization of Legume, oil seed, and dairy

By-product utilization of Legume seeds. By-products of oilseed Industry - Oil seed cake utilization. By-products of dairy industry, Classification, Principle and method of utilization – Whey utilization - demineralization of whey - Lactose preparation, Casein preparation – Utilization of Ghee residue - protein hydrolysates

UNIT III- By- products of vegetable and fruit processing Industry

By- products of vegetable and fruit processing Industry - various wastes obtained in different fruit processing industries - pectin extraction from apple pomace - tartaric acid extraction - oxalic acid. Fruit pits- kernel oil production, Citrus oil production, Value added products from culled fruit, peels and rinds. By-products of fruit and vegetable fermentation - wine and vinegar

UNIT IV- By-products of meat, poultry and egg processing Industry

By-products of meat, poultry and egg processing Industry - Abattoir By-products. By-products of meat, poultry and egg processing Industry - Abattoir By-products. By-products of fish processing units. By-products of spices and plantation crops

UNIT V- By-products of fermentation, sugar and bakery industry

By-products of Alcoholic Fermentation Industries. By-products of Sugar Industry. By-products of BakeryIndustry

FT312 NEUTRACEUTICAL & FUNCTIONAL FOODS
(ELECTIVE - II)

Course Description & Objectives:

This course will give basic knowledge of nutraceuticals and functional foods. By the end of the course students will be able to understand nutraceuticals and functional food and their role in combating various diseases like cardiovascular diseases, cancer, and various techniques to manufacture nutraceutical.

Course Outcomes:

1. *By the completion of the course students will be able to understand.*
2. *Nutraceuticals and functional foods, regulatory issues for nutraceuticals including CODEX.*
3. *Concept of angiogenesis and the role of nutraceuticals/functional foods; Nutraceuticals for cardiovascular diseases, cancer, diabetes, cholesterol management, obesity, joint pain.*
4. *Manufacturing aspects of selected nutraceuticals such as lycopene, isoflavonoids, prebiotics and probiotics, glucosamine, phytosterol.*
5. *Clinical testing of nutraceuticals and health foods; interactions of prescription drugs and nutraceuticals; adverse effects and toxicity of nutraceuticals.*

UNIT I-Introduction to nutraceuticals

Introduction to nutraceuticals: definitions, synonymous terms, basis of claims for a compound as a nutraceutical, regulatory issues for nutraceuticals including CODEX.

UNIT II-Application of Nutraceuticals

Concept of angiogenesis and the role of nutraceuticals/functional foods; Nutraceuticals for cardiovascular diseases, cancer, diabetes, cholesterol management, obesity, joint pain.

UNIT III -Nutraceuticals and Immunity

Immune enhancement, age-related macular degeneration, endurance performance and mood disorders –compounds and their mechanisms of action, dosage levels, contraindications if any etc.

UNIT IV-Manufacturing of nutraceuticals

Manufacturing aspects of selected nutraceuticals such as lycopene, isoflavonoids, prebiotics and probiotics, glucosamine, phytosterols etc.; formulation of functional foods containing nutraceuticals – stability and analytical issues, labelling issues.

UNIT V-Clinical testing of nutraceuticals

Clinical testing of nutraceuticals and health foods; interactions of prescription drugs and nutraceuticals; adverse effects and toxicity of nutraceuticals; nutrigenomics – an introduction and its relation to nutraceuticals.

TEXT BOOKS:

FT314 FOOD SAFETY & MICROBIAL STANDARDS LAB

***Course Outcomes**:*

By the end of the practical exercises, the students will be able to

1. *Know about isolation of toxins from different food materials*
2. *Know about detection of heavy metals from plant and animal source*
3. *Know about risk assessment and management determination*

LIST OF EXPERIMENTS

1. Estimation of bacterial toxins from food sample - I.
2. Estimation of bacterial toxins from food sample - II.
3. Estimation of bacterial toxins from food sample - III.
4. Estimation of fungal toxins from food sample - I.
5. Estimation of fungal toxins from food sample - II.
6. Estimation of fungal toxins from food sample - III.
7. Detection of heavy metal from plant source.
8. Detection of heavy metal from animal source.
9. Risk assessment.
10. Management determination.
11. Study of National microbial quality standards.
12. Study of International microbial quality standards.
13. Visit to export oriented food industry.

III Year B.Tech. Food Tech. II-Semester

L	T	P	To	C
-	-	3	3	2

FT316 PROCESSING OF MILK & MILK PRODUCTS LAB

Course Description & Objectives:

This course will impart knowledge about the various technologies for milk processing. By the end of the course students will be able to understand various technologies for milk processing, processing equipment, Quality standards for dairy products and handling and storage of milk and milk products.

Course Outcomes:

After the completion of this course students will able to understand

1. *Sampling of milk*
2. *Various quality tests for milk.*
3. *Preparation of milk products like dahi, butter, ghee etc.*

LIST OF EXPERIMENTS:

1. Sampling and analysis of milk-COB, Titratable acidity, alcohol test, fat.
2. Study of physico- chemical properties, specific gravity and composition of milk.
3. Determination of adulterants and preservatives in milk.
4. Separation and standardization of milk.
5. Heat processing of milk- Pasteurization.
6. Preparation of butter.
7. Preparation of ghee.
8. Preparation of Dahi and Shrikhand.
9. Preparation of Lassi.
10. Preparation of Khoa.
11. Preparation of Khoa and Khoa based sweets.
12. Preparation of Chhana and Paneer.
13. Preparation of Chhana based sweets.
14. Visit to Dairy plant.

FT401 PROCESSING OF SPICES & PLANTATION CROPS

Course Description & Objectives*:*

This course will impart knowledge about various types of spices and condiments.

By the end of the course students will be able to understand about various types of spices and condiments and their plantation, harvesting, post-harvest technology and treatments, processing, packaging, storage and their marketing.

Course Outcomes:

By the completion of the course students will be able understand

1. *Production and processing scenario of spices and plantation crops and its scope*
2. *Value addition of spices and spice products with different processing methods*
3. *Standards and specifications of spices, packaging of spices and spice products, market value of spices in India*
4. *Marketing of spices, adulteration, specifications for marketed products, packaging and different grades.*
5. *Harvesting post-harvest technology and treatments, processing and extraction, adulteration, specifications for marketed products, packaging.*

UNIT I-Introduction to spices

Introduction and History of Spices and condiments, production and processing scenario of spices and plantation crops and its scope. Value addition of spices and spice products with different processing methods. Definition of major spices, classification of spices, post-harvest technology, processed products and their marketing in trade. Different technologies involved in the preparation of spice powders, spice oils, oleoresins and micro encapsulated products. Standards and specifications of spices, packaging of spices and spice products, market value of spices in India. Herbs and leafy vegetables used as spices and condiments. Definition of plantation crops, Commercial value of plantation crops that are grown in India. Garlic- introduction, harvesting, post-harvest technology, processing methods, processed products and its grades.

UNIT II- Post- harvest technology of Turmeric, Onion, Pepper, Dil seed
Turmeric, Onion, Pepper, Dil seed, - Introduction, harvesting, post-harvest technology and treatments, processing into marketed products, adulteration, specifications for marketed products, packaging and different grades.

UNIT III- Post-harvest technology of Coffee, Clove and Coriander, and Chilli
Coffee, Clove and Coriander, and Chilli - Introduction, harvesting, post-harvest technology and treatments, processing into marketed products, adulteration, specifications for marketed products, packaging and different grades. Tea - Introduction, harvesting, post-harvest technology and treatments, processing into marketed products, adulteration, specifications for marketed products, Types of tea packaging and different grades

UNIT IV-Post-harvest technology of Cumin, Saffron, Oil palm, Cashew nut:
Cumin, Saffron, Oil palm, Cashew nut: Introduction, harvesting, post-harvest technology and treatments, processing into marketed products, adulteration, specifications for marketed products, packaging and different grades. –

UNIT V-Post-harvest technology of Vanilla and Annatto, Coconut, Asafoetida
Vanilla and Annatto, , Coconut, Asafoetida- Introduction, harvesting, post-harvest technology and treatments, processing and extraction, adulteration, specifications for marketed products, packaging and different grades. Chemistry of different spice flavors including coffee, tea, vanilla, and. Ginger: Introduction, harvesting, post-harvest technology and treatments, processing into marketed products, adulteration, specifications for marketed products, packaging and different grades.

FT403 TECHNIQUES IN FOOD ANALYSIS

Course Description & Objectives:

This course will impart knowledge to the students on the Techniques in food analysis.

By the end of the course students will be able to understand various techniques in food analysis and analytical techniques used in Quality control laboratory.

Course Outcomes:

By the end of the course, the students will be able to

1. *Understand the concepts of Techniques in food analysis.*
2. *Understand proximate analysis of foods.*
3. *Understand Biochemical methods and approaches used in Food analysis.*

UNIT I- Introduction to the chemical analysis of food

Introduction to the chemical analysis of food - Definitions of food analysis, Quality control, Official methods of analysis. Association of Official Analytical Chemists, American Association of Cereal Chemists, American Oil Chemists Society Rules and Regulations of Food Analysis. Nutritional Labelling , Food Inspection and Grading, food safety - Safety rules in the chemistry - Safety rules - What to do in case of an accident - Broken Glass - Small chemical spill - Large chemical spill - Chemical splash in your face - Large splash of dangerous chemical on your clothing and or body, small confined fire, small open fire, large fire, your clothing on fire

UNIT II- Spectrophotometer

First Aid -Thermal burns, chemical burns, minor bleeding, toxic fumes, fainting and shock, chemical splashes. Sampling and Sampling Techniques - Introduction - Definitions of Population, Laboratory Sample, sample, precision, accuracy, sensitivity, Reproducibility - of Analysis – Official Samples, Raw Materials. Basic principles of spectrophotometer and colorimeter and its application. Analysis of Carbohydrates - Introduction - Importance of Carbohydrate Analysis – Methods of Analysis – Sample preparation - Extraction of Monosaccharides, Oligo saccharides.

UNIT III-Quantitative analysis of carbohydrate

Chemical methods for carbohydrates - Gravimetric methods - Titrimetric methods - Colorimetric methods - phenol sulphuric acid - Enzymatic methods. Physical methods - Polarimetric method, Refractive index measurements, Density, Infrared radiation, Immuno assays. Analysis of starch and crude fibre.

UNIT IV-Chromatography

Protein concentration by Kjeldhal method, Enhanced Dumas method, using U.V.Visible spectroscopy. Direct measurement at 280 nm, Biuret method, Lowry method, Dye binding method, Turbido metric method. Protein and characterisation - Basic principles of chromatography - types of chromatography and its applications. Analysis of lipids - Introduction - Importance of analysis of lipids - Determination of total lipid concentration - solvent extraction.

UNIT V-Extraction of lipids

Extraction of lipids - solvent, non-solvent extraction methods, instrumentation methods. Determination of lipid composition - Separation and analysis by chromatography – lipids fractions of TLC - Fatty acid methyl esters by GC - Chemical techniques - acid value, instrumental techniques of analysing lipid oxidation in foods - Chromatography, peroxide value - Characteristics of physico chemical properties. Analysis of minerals - Introduction - Importance of mineral analysis - Dry ashing – Wet ashing - Low plasma ashing, Adsorption Spectroscopy.

FT405 FOOD ADDITIVES

Course Description & Objectives:

This course will impart knowledge about various food additives used in food industry.

By the end of the course students will be able to understand different types of food additive and their importance in food processing.

Course Outcomes:

By the end of the course, the students will be able to

1. *learn different aspects of Food Additives - Permitted & Non-permitted Additives, their safety aspects & regulations along with recommended intakes.*
2. *learn Identification, determination to both qualitative & quantitative procedures for estimation of different Food Additives in food.*

UNIT I-Introduction to additives

Introduction: What are Food Additives? - Role of Food Additives in Food Processing - functions – Classification - Intentional & Unintentional Food Additives. Toxicology and Safety Evaluation of Food Additives – Beneficial effects of Food Additives / Toxic Effects - Food Additives generally recognized as safe (GRAS) – Tolerance levels& Toxic levels in Foods - LD 50 Values of Food additives. Naturally occurring Food Additives - Classification - Role in Food Processing – Health Implications.

UNIT II- Preservatives: Color and antioxidant

Food colors - What are food colors - Natural Food Colors - Synthetic food colors - types - their chemical nature- their impact on health.. Preservatives - What are preservatives - natural preservation- chemical preservatives –their chemical action on foods and human system?

Anti-oxidants & chelating agents - what are anti-oxidants - their role in foods - types of antioxidants - natural & synthetic - examples - what are chelating agents – their mode of action in foods

UNIT III-Surface active agents role in food

Surface active agents - What are surface active agents - their mode of action in foods - examples. Stabilizers &thickeners - examples - their role in food processing. Bleaching & maturing agents: what is bleaching -Examples of bleaching agents - what is maturing - examples of maturing agents - their role in food processing.

UNIT IV-Starch modifiers

Starch modifiers: what are starch modifiers - chemical nature - their role in food processing. Buffers - Acids &Alkalis - examples - types - their role in food processing. Sweeteners - what are artificial sweeteners & nonnutritive sweeteners - special dietary supplements & their health implication - role in food processing.

UNIT V-Flavoring agents used in food

Flavoring agents - natural flavors & synthetic flavors - examples & their chemical nature - role of flavoring agents in food processing. Anti-caking agents - their role in food processing. Humectants - definition on their role in food processing.. Clarifying agents - definition examples - their role in food processing.

FT407 FOOD PROCESSING EQUIPMENT

Course Description & Objectives:

This course will impart knowledge about various food processing equipment and their design& considerations.

By the end of the course students will be able to understand about processing equipment and their working principle.

Course Outcomes:

By thecompletion of the course students will be able to understand the

1. *Design consideration of food processing equipment and factors affecting them like stress, thickness and material of construction.*
2. *Pumps and pipelines and their application in food industry.*
3. *Design of dryer, heat exchanger and evaporators.*
4. *Design of high pressure processing, pulse electric field processing, ultrasound and pulse UV light.*
5. *Operating and performance parameters in mechanical, thermal and mass transfer operations carried out in food processing.*

UNIT I-Equipment design

Design considerations of agricultural and food Processing Equipment: factor of safety, theories of failure, allowable stresses, minimum thickness after forming; Materials of Construction.

UNIT II-Pumps and pipelines

Introduction to pumps and pipelines. Process plant piping, hygienic considerations and ease of cleaning for insulated as well as un-insulated pipes Introduction to boilers.

UNIT III-Design of dryers

Design of dryers: Introduction, types of driers, design consideration of dryers. Design of heat Exchangers, evaporators.

Unit IV-Design of HPP, PEF, UV equipment

Design of high pressure processing, pulse electric field processing, ultrasound and pulse UV light

UNIT V-Unit operation in food processing

Identification of design, operating and performance parameters in mechanical, thermal and mass transfer operations carried out in food processing such as; particulate size reduction, homogenization, centrifugation, packaging, mixing, conveying, extrusion, storage, heating, cooling, freezing, puffing, frying, distillation, extraction, concentration and drying. Developing mathematical relationship between the independent and dependent variables affecting the food processing operations by using physical and chemical principles governing the processes. Factorial, fractional factorial and rotatable central composite experimental design. Developing empirical equations using experimental data. Developing predictive model using Neural network. Optimization of processing parameters using Genetic algorithms. Application of Fuzzy logic to sensory evaluation and ranking of foods

FT 409 FOOD PLANT LAYOUT, MANAGEMENT AND UTILITIES
(ELECTIVE - III)

Course Description & Objectives:

This course will impart knowledge about plant design, plant layout planning, linear programming in plant design and maintenance of food plant**.**

By the end of the course students will be able to understand plant design and safety parameter related to plant design

Course Outcomes:

By the completion of the course students will be able to understand

1. Basics of plant design, feasibility study of plant design.
2. Plant layout considerations involved in planning an efficient layout. Types of layouts.
3. Linear Programming in plant design.
4. Materials of construction of Equipment.
5. Safety Color Code, Roof Inspection, Care of Concrete floors. ColorCoding:Color – Code System - Specific Hazards Color codes for buried pipes and cablesColor Scheme for pipes.

UNIT I-Introduction to plant design

Introduction: Plant design concepts - situations giving rise to plant design problems - general design considerations - differences in design of food processing and non-food processing plants. Feasibility study: Steps involved including planning of the study - collection of information - information flow diagrams – market analysis, technical analysis and preparation of feasibility report. Plant location: Factors affecting plant location, their interaction with plant location, theory models for evaluation of alternate locations. Plant size: Economic plant size - factors affecting the plant size - raw materials availability, market demand, competition in the market - return on investments. Procedures for estimation of economic plant size - break even analysis and optimization techniques - estimation of volume of production for each product - in case of more than one product that will maximize profits. Process scheduling

UNIT II-Plant layout and consideration

Plant layout: considerations involved in planning an efficient layout. Types of layouts. Equipment symbols - flow sheet symbols - electrical symbols - graphic symbols for piping systems including pipe fitting and valves. Standards for space requirements - distances between critical plant areas and for setting different plant facilities. Development of the pilot layout: Size and structure of the pilot plant, minimum and maximum size, types and applications, pilot plant design. Engineering Economy : Definitions : Time value of money, inflation, Interest, Interest rate, compound interest, rate of return, payment, receipt , cash flow, present value, Equivalence, sunk costs, opportunity costs, Asset, Life of an asset, depreciation, book value of an asset, salvage value, retirement, replacement, defender and challenger. Methods of economic evaluation of engineering alternatives

1. Undiscounted cash flow methods -payback period method
2. Discounted cash flow methods

a) Net present value method

b) Equivalent annual method

c) Rate of return method

3. Cost- benefit analysis, Social costs, social benefits

UNIT III- Introduction to linear programming

Linear Programming: Introduction, Salient features of linear programming (Terminology), Formulation of linear programming model, Advantages, limitations and applications of linear programming, solution of linear programming problems. Linear Programming: Introduction, Salient features of linear programming (Terminology), Formulation of linear programming model, Advantages, limitations and applications of linear programming, solution of linear programming problems. Queuing theory: Introduction, Elements of queuing system, 1) Input source, 2) Queue and 3) Service mechanism. Queuing theory: Introduction, Elements of queuing system, 1) Input source, 2) Queue and 3) Service mechanism. Common problems in plant layout:Service system layout problem, Manufacturing layout problem, Warehouse layout problem, Non-traditional Layout problem.

UNIT IV- Equipment and material handling

Selection of equipment: Process equipment - material handling equipment – service equipment- valves and fittings - instruments and controls-considerations involved in equipment selection. Estimation of Services and Utilities:Utilities: Fuel oil cost, Natural gas cost, electricity cost, steam cost, cooling water cost, Refrigeration cost, waste treatment cost. Estimation of Services such as Cafeteria, locker rooms, water closets, sinks, parking lots, exercise area. Office Layout. Line Balancing and Line balancing techniques. Materials of construction of Building / structure and Equipment: Building and Structure: Foundations, supporting structure, walls, Floors, Slope of Floors, Doors, piping, Electrical, Ventilation, Hand - Cleaning - Stations.

UNIT V-Materials of construction of Equipment

Materials of construction of Equipment: Characteristics of suitable construction material: Stainless steel, Aluminium, Nickel and Monel, Plastic Materials. Materials of construction of Equipment: Characteristics of suitable construction material: Stainless steel, Aluminium, Nickel and Monel, Plastic Materials. Maintenance of Food Plant Building: Safety Colour Code, Roof Inspection, Care of Concrete floors ColourCoding:Colour – Code System - Specific Hazards Colour codes for buried pipes and cablesColour Scheme for pipes. Illumination and ventilation. Cleaning & sanitization Painting and colour coding and Fly and insect control.

FT411 PROCESSING OF FISH AND MARINE PRODUCTS
(ELECTIVE - III)

Course Description & Objectives:

This course will impart knowledge about fisheries.

By the end of the course students will be able to understand the resources, types, handling, processing techniques, packaging, transportation and spoilage and various quality and safety standards for fish and fish products

Course Outcomes:

By the completion of the course students will be able to understand the

1. *Types, composition, and nutritive value, spoilage and factors affecting the spoilage of fish.*
2. *On-board handling and various methods of preservation like smoking, drying, canning, salting etc. of fish.*
3. *Fermentation and fermented fish products, freezing and equipment, novel methods of fish processing like Low dose irradiation& high pressure, MAP; Vaccum packaging.*
5. *Hurdle technology, Types of value added fish Products - Fish finger - Surimi - Fish burger - Fish protein concentrates, – flakes, Types of packaging used for fish..*

UNIT I-Introduction to fisheries

Fisheries resources - Global and Indian Scenario - Types of fishes and other marine products. Biochemical composition of fish - prawn and marine fishes - Proximate composition. Nutritive value of Fish flesh – prawn and marine foods. Types of fish - Anatomy - Deboning process of fish. Post-mortem changes in fish and quality assessment - types of fish spoilage – enzymatic - chemical & microbial. Spoilage indices of fish – Factors affecting spoilage of fish.

UNIT II- Drying and canning of fish

On-board handling - Need for hygienic handling - Handling fish onboard - washing – sorting Eviscerationremoval of gills - bleeding icing - bulking -

shelving and boxing.. Drying, Dehydration - principles of drying - Types of drying and types of dryers. Effect of drying on the quality of fish - Spoilage of fish during drying - Advantages - disadvantages. Smoking - Preservative action of smoke - composition of smoke - physical and chemical characteristics of smoking agents - Preparation of fish for smoking and smoking process. Types of
Marinades in fish processing. Salting - Dry Salting process - Wet salting process. Canning of Fish – Canning process - Equipment required - filling - Exhausting - Sealing - Can washing -Thermal processing/sterilization - Advantages

UNIT III-Fermentation and Freezing of fish

Fermentation - Fermented fish products - liquid fermented fish products (Sauces) – Factors affecting quality of fish sauce. Fermented fish - method of processing - Lactic acid fermented products. Traditional methods – Low temperature storage - Freezing of fish - prawn - process of Freezing - principles of refrigeration – factors affecting - freezing time of fish - Quick freezing. Slow freezing methods - equipment required-types - direct and indirect systems – Changes associated with freezing and cold storage of fish. Chemical treatments used in fish processing industry. Novel Methods - Low dose irradiation& high pressure treatment - Principle - application in fish and prawn processing industry. MAP; Vaccum packaging; Gas Packaging - Principle - application in fish and Prawn processing industry

UNIT IV-Value added Fish products

Oxygen Absorbents-Carbon dioxide generators - Ethanol vapour - Principle - Application in fish and prawn processing industry. Hurdle barrier concept - principle and application in fish processing industry. Value added Fish products - What is Value addition? - Types of value added fish Products - Minced fish - Fish finger - Surimi - Fish burger - Fish protein concentrates, cutlets – balls -noodles - flakes. Processing of Fish oils - Chitosans - fish meal - Isinglass - pearl Essen. Fish Packing - Types of packaging used for fish. Fish Packing - Types of packaging used for prawn and other sea foods

UNIT V-Quality Assurance and Standard

Sea food Quality Assurance - Quality management. HACCP - implementation of HACCP in fish and marine processing. Quality control and standards for fish, prawn and other sea foods. EU hygienic regulations in fish and marine industry. ISO 9000 and ISO 14000 certification for standards in fisheries. New kinds of quality and safety problems emerging in sea foods processing and Preservation

FT413 FOOD QUALITY & CERTIFICATION
(ELECTIVE - III)

Course Description & Objectives:

This course will impart knowledge about National and international food quality standard& certification systemdealing with food products

After the completion of the course students will be able to understand quality, quality control, tools of quality control and various national and international quality standards dealing with food quality and safety.

CourseOutcomes:

By the completion of the course students will be able to understand

1. *Food quality and quality attributes, quality control and its function, quality assessment of fruits & vegetable and cereals and legume.*

2. *Quality Assessment of Food materials like Dairy Products / Milk and Milk Products, Meat, Poultry, Egg and Processed food Products, Different methods of Quantitative descriptive analysis.*
3. *Determination of Sensory thresholds and taste Interactions, Objective/ Instrumental analysis of Quality Control, Food laws and Standards (BIS). Consumer Studies.*
4. *Novel Foods & aspects of Labelling.*
5. *International food regulations and certifications. The concept and process of implementation of HACCP in an industry, ISO9000 series, Food Adulteration and Food Safety.*

UNIT I-Food Quality

Food Quality - its need and its role in Food Industry. Food Quality and Quality Attributes - Classification of Quality Attributes and their role in food Quality. Objectives, Importance and Functions of Quality Control. Methods of quality concepts of Dough Rheology. Quality Assessment of Food materials - Fruits and Vegetables. Quality Assessment of Food materials - Cereals and legumes.

UNIT II-Quality assessment of food products

Quality Assessment of Food materials - Dairy Products / Milk and Milk Products. Quality Assessment of Food materials - Meat, Poultry, Egg and Processed food Products. Statistical Quality Control of Foods. Sensory Evaluation of Food Quality - Introduction - Panel Screening - Selection of Panel Members. Requirements for conducting Sensory Evaluation and serving procedures. Methods of Sensory Evaluation and Evaluation cards - Difference/ discrimination procedures. Methods of Sensory Evaluation and Evaluation cards - Ranking and Rating procedures. Different methods of Quantitative descriptive analysis

UNIT III- Food laws and Standards and consumer study

Determination of Sensory thresholds and taste Interactions. Objective/ Instrumental analysis of Quality Control. Food laws and Standards (BIS). Consumer Studies - Types of Consumer studies - Preference Studies and Acceptance Studies. Consumer Studies - Types of Consumer studies - Preference Studies - Objectives of Consumer Preference Studies - factors affecting consumer acceptance. Information obtained from Consumer Study

- Factors Influencing results from Consumer surveys. Methods of Approach - Development of the questionnaire - Types of Questionnaire andother methods of data collection

UNIT IV- Food grade, legislation and standards

Comparison of Laboratory Panels with Consumer panels. Limitations of Consumer Survey. Fundamentals of Food regulations - pertaining to Additives and Contaminants. Food regulations pertaining to aspects of Hygiene - Novel Foods & aspects of Labelling. Different existing Food legislations-norms in implementation. Food grade and standards

UNIT V- International & Indian food regulations and certifications

International food regulations and certifications. Indian food regulations and Certifications. Concept of Codex Alimentarius. The concept and process of implementation of HACCP in an industry. USFDA - the cause of its existence - its role in safe guarding food quality - ISO9000 series- Significance. Food Adulteration and Food Safety.

FT415 FOOD BIOTECHNOLOGY
(ELECTIVE - IV)

Course Description** & **Objectives:

This course will impart the knowledge to students about Prospectus of Biotechnology in food sector.

By the end of the course students will be able to understand biotechnology and Application of Biotechnology in food industry and Agriculture

CourseOutcome:

By the end of the course, the students will be able to

1. *Get knowledge about basics and fundamentals of Molecular biology.*
2. *Know about rDNA Technology and their applications in different areas.*
3. *Know about cell and tissue culturing techniques.*
4. *Know about application of biotechnology in particular to food industries.*

UNIT I - Prospectus of Biotechnology

Prospectus of Biotechnology-new development in the science of gene manipulation – a rash of new companies -to commercialize the new technology - Human genome sequencing project - potential for human therapy -Fundamentals of molecular biology - DNA as genetic material – Hersheyand chase experiment - RNA as genetic material - Viruses and bacteriophages Transcription - Translation. Chemistry and biology of DNA - Structural elements of nucleic acids - sugar –Anionic group - Nitrogenous bases - Purines - pyrimidine’s - Nucleosides - Nucleotides – Phosphoric acid.Primary conformation of DNA - Secondary conformation of DNA - Watson and Crick model -Types of DNAA, B, Z - - Types of RNA

UNIT II- DNA synthesis

Requirements for DNA synthesis - Substrate - Primer - proteins - DNA polymerase - I, II, III - Helicase -Topoisomerase - primase - ligase - ssb proteins - Mechanism of replication - Initiation - elongation -termination. Genetic recombination - Gene transfer mechanism - Conjugation - Process - F plasmid - Hfr factor- Transformation - Competence - Gram positive transformation - Gram negative transformation. Micro injection

Transduction - Generalized transduction - Co-transduction - Abortive transduction - Specialized transduction.Industrial fermentation process

UNIT III- Fermentation and Enzyme

Types of fermentations - Batch fermentation - Feed batch fermentation - Sub batch fermentation – Continuousfermentation - Multiple fermentations - Multistage fermentations. Regulation of gene expression - Induction repression- LAC operon- The operon model - promoter - operator- Structural genes - Lac Z gene - Lac Y gene -Lac A gene - regulation of lac operon - negative regulation - positive regulation.

Different enzymes used - Helicases - premases – topoisomerases - RNA polymerase I, II, - Holoenzyme – sigmafactor - DNA Gyrase - DNA polymerase - I, II, III. Restriction enzymes - restriction endonucleases -RecombinantDNA technology.

UNIT IV-Cell and Tissue culture

Cell and Tissue culture- Animal cell culture- primary cell lines - secondary cell lines - Minimal essentialmedium - Amino acid assay medium - plant cell culture- Plasticity - Totipotency - MS medium –micro propagation- callus formation - Organ development – tissue transformation - uses of tissue culture. Expression of foreigngenes - Transformation - calcium chloride mediated – calcium phosphate mediated - microinjection – liposomemediated gene transfer - electroporation. Selection of cells containing cloned genes - selection based onantibiotic resistance - complementation of nutritional defects - assay of biological activity – immunochemicalmethod - colony hybridization - Expression of target gene in the host cell - Shot gun method- DNA libraries -

UNIT V- Application of Biotechnology in Agriculture

Application of Biotechnology in Agriculture - Improvement of nutritionalquality - post harvest technology - Changing plants at their genetic level - To develop nitrogen fixation -Productionof disease resistant plants. Bio gas plant - Anaerobic digestion - Methane formation – Methanogenicfermentations - Methane oxidation - Hydrocarbon degradation - Anaerobic digester designs - positive andnegative features of anaerobic process

FT417 FOOD STORAGE AND TRANSPORT ENGINEERING
(ELECTIVE - IV)

Course Description & Objectives:

This course will impart knowledge about handling equipment and storage methods used in food industry.

By the end of the course students will be able to understand material handling equipment, principle and practices of storage

Course Outcomes:

After completion of this course students will be able to understand

1. *About material handling system, equipment and storage design*
2. *Design of screw, bucket, belt, oscillation & vibrating conveyor.*
3. *Refrigerated transportation of food materials*
4. *Principles and practices of storage*
5. *Conventional& modern storage structures for fruits, vegetables, meat and marine products*
6. *Layout and Design of storage structures, economics of storage structures*

Unit I-Material handling

Overview of material handling system and devices in food processing plants.

Unit II-Conveyor design

Design of screw, bucket, belt, oscillation & vibrating conveyor.

Unit III-Transportation and storage of food

Refrigerated transportation of food materials. Principles and practices of storage: Physicochemical changes in stored products during storage, air tight, non-air tight, underground conventional storage structures for fruits, vegetables, meat and marine products

Unit IV-Modern storage structure

Modern storage structures for fruits, vegetables, meat and marine products; Aerated, refrigerated and controlled atmospheric storage;

Unit V-Layout and Design

Layout and Design of storage structures, economics of storage structures.

FT419 FOOD LAWS & REGULATIONS
(ELECTIVE - IV)

Course Description & Objectives:

This course will impart knowledge about various food laws and regulation for all kinds of food products

After completion of this course students will be able to understand establishment and importance of various food laws and regulation.

Course Outcomes:

After completion of this course students will be able to understand

1. *The need for food/standards and their enforcement and various types of laws.*
2. *Establishment of Food Safety and Standards Authority of India (FSSAI) and its composition.*
3. *Milk and Milk Product Order, 1992 (MMPO)*
4. *Optional food standards. Their scope, Need.*
5. *Codex standards for Fruits and Vegetables Codex standardsfor Meat and Poultry products Recommended International Code of hygiene for various food products.*

UNIT I-Introduction to food standard

Introduction - What is the need for food/standards and their enforcement,various types of laws-Mandatory/Regulatory and Voluntary/Optional - Introduction to various food laws (Mandatory) - Food Safetyand Standards Act, 2006 (FSSA), Edible Oils Packaging (Regulation) Order, 1998, Environment (Protection)Act, 1986, Fruit Products Order, 1955 (FPO), Meat Food Products Order, 1973 (MFPO), Milk and Milk ProductOrder, 1992(MMPO), Solvent Extracted Oil, De-oiled Meal and Edible Flour (Control) Order, 1967, Standardsof Weights and Measures Act, 1976, Essential Commodities Act, 1955, Export (Quality Control andInspection) Act, 1963, The Insecticides Act, 1968, Vegetables Oil Products(Control) Order, 1998, Prevention ofFood Adulteration Act & Rules (PFA Act), 1954Introduction to various food laws (Voluntary) –AgmarkStandards (AGMARK), CodexAlimentarius Standards, BIS

Standards and Specifications, Consumer Protection Act, 1986. Food Safety andStandards Act, 2006 (FSSA) - Need, Scope and Definitions (Chapter I ofFSSA, 2006).

UNIT II- Establishment of FSSAI

Establishment of Food Safety and Standards Authority of India (FSSAI) (II Food Safety Officer (FSO)/Food Inspector (Called so by PFA Act) - Powers, Duties and functions of FSO. Prevention of Food AdulterationAct & Rules (PFA Act), 1954. Definition. Object of the act. Central committee for food standards. Powers of the food Inspectors. Procedures to be followed by theFood Inspectors. Report of public analyst. (PFA Act 1954 and Part IV of PFA Rules, 1955) Sealing, fasteningand dispatch of samples.

UNIT III- Power of court and various Acts

Powers of Court (Section 14 to 25 of PFA Act, 1954). Consumer Protection Act, 1986 and Consumer ProtectionRules, 1987. - Need, Scope, Functions and Enforcement. Environment (Protection) Act, 1986. - Need, Scope,Functions and Enforcement. The Insecticides Act, 1968. - Need, Scope, Functions and Enforcement. The Export(Quality Control and Inspection) Act, 1963. - Need, Scope, Functions and Enforcement. Fruit Products Order,1955 (F8PO). - Need, Scope, Functions and Enforcement.

UNIT IV-Need and significance of food laws and regulation

Milk and Milk Product Order, 1992 (MMPO). - Need, Scope, Functions & Enforcement. The Plants, Fruits andSeeds (Regulation of Imports in India) Order, 1989. - Need, Scope,Functions and Enforcement. Edible Oils Packaging (Regulation) Order, 1998. - Need, Scope, Functions &Enforcement. Meat Food Products Order, 1973 (MFPO). - Need, Scope, Functions & Enforcement. Standards ofWeights and Measures Act, 1976. - Need, Scope, Functions & Enforcement. The Essential Commodities Act,1955. - Need, Scope, Functions & Enforcement

UNIT V-Optional food standards.

Optional food standards. Their scope, Need - Procedure to obtain that standard (ISO 9001, 14000 etc.).AGMARK. Bureau of Indian Standards (BIS). Codex Alimentarius. Scope of Codex Alimentarius and CodexStandards. Codex standards for Cereals & Pulses. Codex standards for Fruits and Vegetables

Codex standardsfor Meat and Poultry products Recommended International Code of hygiene for various food products

TEXT BOOKS:

1. Patricia and ACurtis *An operational Text Book, Guide to Food Laws* and *Regulations*.
2. Ranganna S. *Hand book of Analysis and Quality Control for Fruit and Vegetable Products.*

REFERANCES:

FT421 PROCESSING OF SPICES & PLANTAION CROPS LAB

***Course Description & Objectives**:*

This course will impart knowledge about various types of spices and condiments.

By the end of the course students will be able to understand about various types of spices and condiments and their plantation, harvesting, post-harvest technology and treatments, processing, packaging, storage and their marketing.

Course Outcomes:

By the end of the practical exercises, the students will be able to understand

1. *Identification of flavoring compounds of spices*
2. *Extraction of oil from various spices*

LIST OF EXPERIMENTS

1. Identification and characterization of flavoring compounds of spices
2. Extraction of oil from clove and pepper

3. Extraction of oil from cardamom and chili
4. Extraction of oleoresins- turmeric or ginger
5. Extraction of oleoresins- pepper or clove
6. Piperine estimation in pepper oleoresin
7. Steam distillation of spices
8. Determination of curcumin content in turmeric
9. Chemical analysis of spices- Moisture, valuable oil, specific gravity, refractive index andacid value
10. Study of standard specifications of spices
11. Preparation of different spice powders
12. Packaging study of spices
13. Visit to cashew processing industry
14. Visit to spice processing industry

IV Year B.Tech. Food Tech. I-Semester	L	T	P	To	C
	-	-	3	3	2

FT423 TECHNIQUES IN FOOD ANALYSIS LAB

Course Description & Objectives:

This course will impart knowledge to the students on the Techniques in food analysis.

By the end of the course students will be able to understand various techniques in food analysis and analytical techniques used in Quality control laboratory.

Course Outcomes:

By the end of the practical exercises, the students will be able to

1. Adapt suitable method for food analysis.
2. Apply the knowledge of Techniques in Food Analysis.
3. Differentiate between Qualitative identification and Quantitative estimations.
4. Understand the separation of biomolecules using various biochemical techniques.

LIST OF EXPERIMENTS

1. Introduction to Food Analysis Techniques
2. Sampling techniques and methods of sample preparation
3. Calorimetry and spectrophotometry
4. Determination of pH of Food samples (milk, flours, jams)
5. Determination of Titratable acidity
6. Determination of Moisture and Total solids
7. Estimation of carbohydrates by Phenol Sulphuric Acid method
8. Estimation of Fructose by Roes method
9. Estimation of starch
10. Analysis of crude fibre
11. Estimation of free Fatty acids in plant oils
12. Estimation of free Fatty acids in animal oils
13. Estimation of Cholesterol
14. Test for adulterants in Sugar, Jaggery, Honey, Milk, Ghee, plantation crops (Tea, coffee), Turmeric, spices(Cardamom, cloves, pepper)

IV Year B.Tech. Food Tech. I-Semester

L	T	P	To	C
-	-	3	3	2

FT425 FOOD PROCESSING EQUIPMENT LAB

Course Description & Objectives:

This course will impart knowledge about various food processing equipment and their design& considerations.

By the end of the course students will be able to understand about processing equipment and their working principle.

Course Outcomes:

By the end of the practical exercises, the students will be able to understand

1. *Equilibrium sorption isotherms, gas transmission rate, Material balances, pressure drop across filter.*
2. *CIP.*

LIST OF EXPERIMENTS

1. Lab demonstration on state of water.
2. Demonstration of equilibrium sorption isotherms.
3. Determination of gas transmission rate.
4. Determination of water vapor permeability of packages.
5. Evaluation of properties of films to determine their suitability as containers for foods.
6. Shelf life calculations for food products.
7. Material balances over screen and screen effectiveness.
8. Determination of pressure drop across filter using Hermons-Bredee equation.
9. Determination of area of filter medium in a continuous filtering centrifugal.
10. Overall material balance for two component system in a continuous distillation plant.
11. Study of freezers.
12. Study of CIP treatment for fruits and vegetable processing plant.
13. Study of CIP treatment for Dairy - processing plant.

IV Year B.Tech. Food Tech. II -Semester

L	T	P	To	C
4	0	-	4	4

FT402 INSTRUMENTATION & PROCESS CONTROL (ELECTIVE - V)

Course Description & Objective:

To impart knowledge to the students on instrumentation and process controls used in food industry.

Course Outcomes:

By the end of the course the students will be able to

1. *Understand the different instruments used in different operations of food industries*
2. *Know about working principles of different instruments used in different operations*

UNIT I - Elements of Instruments

Introduction - measurements - methods of measurements - primary measurements –secondarymeasurements - tertiary measurement - instruments and measurement systems- mechanical instruments - electrical instruments - electronic instruments.Functional elements of measurement systems - basic functional elements – auxiliary elements - transducer elements - examples of transducer elements. Characteristics of transducer elements - signal conditioning elements – amplification .Standards of measurements - international standards - primary standards – secondary standards - working standards - calibration - classification of calibration

UNIT II - Static and Dynamic Characteristics

Performance characteristics - static and dynamic performance characteristics – accuracy – precession- resolution - threshold - static sensitivity - deflection factor . Primary sensing elements – mechanical devices as primary detectors - springs, bimetallic strips - mechanical spring devices - cantilever - helical spring - spiral spring - torsion bar - proving ring - pressure sensitive primary devices Temperature and temperature scales - classification of temperature measuring devices - glass thermometers - bimetallic pressure gauge thermometers - thermocouples. Electrical resistance thermometers - desirable properties of liquids used in glass thermometers.

UNIT III - Thermocouples

Law of intermediate temperatures - law of intermediate metals - thermo electric sensors - thermocouples classification - base metal thermocouples - rare metal thermocouples. Properties of thermocouples - calibration of thermocouples - comparison method – fixed point. Tutorials on temperature. Pressure - gauge pressure, absolute pressure, differential pressure, vacuum - units of pressure - pressure scales - conversion of units . Measurement of pressure - mechanical pressure instruments - manometers - U tube manometer - inclined tube manometer - well type manometer .Elastic type pressure gauges - classification of elastic type gauges - bourdon tube – metallic diaphragm - capsule – bellows . Differential gauges - metallic diaphragm pressure gauge – capsule pressure gauges Tutorials on pressure. Measurement of flow - classification of flow meters - flow of incompressible fluids in pipes- Reynolds number - discharge coefficient - flow coefficient.

UNIT IV - Flow Metering

Flow of compressible fluids in pipes - orifice flow meter - types of orifice plates – materials for orifices. Venturi tubes - venturi construction - types of venturi tubes. Secondary/rate meters - variable head meters - variable area meters - types of weirs. Pitot static tube - its advantages - its limitations – flow meters. Anemometers - principle - types of hot wire anemometer - constant current type – constant temperature type - comparison between constant current and constant temperature type. Mechanical anemometers types - working principle - vane anemometer - three cup anemometer – impeller anemometer. Liquid level measurement - various methods of level measurement by industry – level measurement using gauge glass technique

UNIT V - Pressure Measurement

Gauge glass technique construction and working - its advantage and disadvantages. Float type level indication - float level switch - rope method. Float operated spring loaded switch - magnetic float device. Tutorials on level. Hydrostatic pressure measurement in open tanks - hydrostatic pressure measurement in closed tank - hydrostatic level gauge applications. Data transmission elements - classification - land line type transmission elements – radio frequency type transmission elements. Electrical type data transmission elements - pneumatic type transmission element. Position type data transmission elements - radio frequency transmission system

IV Year B.Tech. Food Tech. II -Semester	L	T	P	To	C
	4	0	-	4	4

FT404 INDUSTRIAL MICROBIOLOGY
(ELECTIVE - V)

Course Description & Objectives:

To impart the knowledge to students about Fermentation technology and its application in Food industry and industrially important Microorganisms and their application in food industry.

Course Outcomes:

By the end of the course, the students will be able to

1. *Know about Industrial fermentation techniques.*
2. *Know about different Industrially important micro organisms.*
3. *Know about different growth regulators (Hormones).*
4. *Know about different products produced by Industrial fermentation process.*

UNIT I - History of Industrial Microbiology

Microbes as friend's - Normal flora - History of Industrial Microbiology, Microbes influencing our lives -Primarymetabolites& secondary metabolites produced by the microorganisms.. Screening ofMicroorganisms - Primary screening - Isolation of desired and interested microorganisms – Secondaryscreening - yield potential of microbes - both qualitative and quantitative approach. Strain Improvement -Preservation of Microorganisms - Organizations involved in microbiological work . Fermentation media -Characteristics of an ideal production medium, Raw materials as media, Precursors and Inducers,Repressors, Antifoams . Industrial sterilization - Principles of Sterilization - Sterilization of equipment, Sterilization of Production media and sterilization of air. Types of fermentors - Stirred tank fermentors -Packed bed fermentors - Fluidized bed fermentors - Bubble column fermentor - Air lift fermentor -Cylindrical fermentors – Flocculated cell culture fermentor - Multi phase bioreactors - Trickling bedbioreactors - Tubular fermentor- Mechanically agitated stirred tank reactors, Deep jet fermentor, CycloneColumnFermentor, Novel See saw Bioreactor, Stirred tank fermentor (CSTF).

UNIT II - Components of a Fermentor

Fermentor - Components of a Fermentor, Parts of Fermentors, Peripheral parts andaccessories, Alternative Vessel Designs, Additional accessories and Peripherals, Feedpumps, Exit gas analysis, Common measurements and Control systems (Speed Control,Temperature control, Control of Gas Supply, Control of pH, Control of Oxygen). Types of fermentations -Solid Substrate Fermentation-Submerged Fermentation – Factors affecting Submerged culture – Batchfermentation - Fed batch fermentation - Sub batch fermentation - Continuous fermentation – Multiplefermentations - Multistage fermentations.. Industrially important secondarymetabolites - Production ofOrganic acids - Citric acid, Lactic acid, Itaconic acid, Acetic acid, Gluconic acid, Kojic acid, Gallic acid -Production - Microorganisms & Metabolisms - Fermentation conditions - Inoculum preparation – Carbonand nitrogen source - Trace elements - pH and temperature - Aeration and Agitation. Yieldand Recovery. Uses of organic acids. Production of Antibiotics - Screening of antibiotic producers - â -lactam antibiotics - Penicillin- Amino glycoside antibiotics - Tetracyclines, Chloramphenicol, Griseofulvin, Macrolideantibiotics, Rifamycins. Streptomycin - Chemical nature and biosynthesis – Commercialproduction - Inoculum - Media - Fermentation process - Temperature - Aeration - pH -Biomass production - Recovery and purification - uses of antibiotic.. Probiotics – Importance – role infermented dairy foods - Yoghurt - *Lactobacillus acidophilus- Bifidobacterium- Lactobacillus delbrueckii-Lactobacillus bulgaricus-* Standard number of Probiotics to be used - Probiotic cheese –*Lactobacillussalivarius- Bifido bacterium* bifidum - Kefir - combination of Lactic acid bacteria and yeasts- therapeutic and medicinal value - enhances digestion.. Bacteriocins - Nisin - Production - metabolism – Fermentationconditions - Inoculum

UNIT III - Morphology

preparation - carbon and nitrogen source - Trace elements - pH and temperature requirement - Recovery and purification. Biocolours - carotenoids - lycopene - Angkak- production - using fungi -*Monascuspurpureus*- History and traditional uses - Morphology - Fermentation conditions - Pigment of*M.purpureus*- Health benefits -Toxicology - Safe consumption . Plant growth regulators and Hormones -Role in metabolic activity of plants – Microorganismsinvolved in the production of Auxins, Gibberellins, Cytokinins, purification.Role of Ethyleneandabscissic acid in plant metabolic activity.Production of Microbial enzymes - Solid state fermentation -Fermentors - Medium Advantages and disadvantages - Submerged fermentation - Steps of enzymeproduction -Factors affecting submerged culture. Production of Amylases, proteases, Pectinases,Cellulases . Extraction of enzymes - physical disruption method - Chemical treatment method -Purification of enzyme - removal of nucleic acids and cell debris - preliminary purification - Final purification - Applications. Downstream processing - Steps involved in the purification of biological -Capture intermediate - Polishing - Cell disruption methods - Chemical methods - Mechanical methods –Sonication - Freeze - thawing - Concussion device - Liquid shear - Colloid mill - French press .Centrifugation - Flocculation and coagulation - Filtration - Product concentration- Extraction- Chromatography - Size exclusion - Ion exchange - Affinity - Hydrophobic interaction -Immobilized metal ion affinity chromatography - HPLC - Gas chromatography –Supercriticalfluid chromatography - Electrophoresis - Mass spectrometry . Microbial polysaccharides – Bacterialpolysaccharides - Localization and description - Xanthan - Pullan - Curdlan - Exopolysaccharidesfromlactic acid bacteria - dextran – from extremophilic bacteria . Fungal polysaccharides - cell wallpolysaccharides - Lichen cell wall polysaccharides fungal exopolysaccharides - Production ofpolysaccharides - Culture techniques and fermentation parameters - Agitation - pH - Aeration –culturemedium - immobilized micro organisms - Solid state fermentation

UNIT IV - Polysaccharides

Applications of polysaccharides - Polysaccharides as food additives – Pharmaceuticalapplications - Oligosaccharides derivatives. Production of amino acids – Historical developments -Manufacturing methods – Extractive isolation - Chemical synthesis - Enzymatic catalysis – Fermentativeproduction - L – Glutamic acid - L- Lysine - uses and applications. Production of vitamins – Generalaspects - Nomenclature and classification - Vitamin B complex - Vitamin B12 - Vitamin B2 - production ofthese vitamins - production by fermentationof*Ashbyagossypii*- Vitamin C. Production of bio insecticides - *Bacillus thuriengensis*- insecticidal protein - endotoxin - engineering with endotoxin gene - rDNA

technology - inserting into maize - cotton - rice - BT cotton. Production of SCP - Single cell proteinadvantages - Source of SCP - Production of bacterial biomass - Production using waste - Starchy waste -from Algae - Nutritive value of SCP - Consumption of SCP - uses of SCP. Bakers yeast - Development and history - The Vienna process - Production of yeast -

Nutrient materials - Concentration of sugar - Aeration - temperature - pH - Molasses ammoniaprocess - yeast from sulphite liquor - Florylin yeast - Food and fodder yeast - yeast products- fat from yeast - vitamins from yeast

UNIT V - Multiple fermentations

Batch fermentation - Fed batch fermentation - Sub batch fermentation – Continuousfermentation - Multiple fermentations - Multistage fermentations. Food based fermented products -Cheese - Types, ripening of cheese - Yogurt – Buttermilk - Acidophilus milk - Cream –Fermentedvegetables - Saurerkraut - pickles - Silage - Kimchi. Olives - Fermented meat - fish - Bread and otherfermented plant products – fermented cereal foods. Wine, production and Beer production and Mushroomproduction . Biochemical changes - fermented legumes foods - Bhallae - Papadam - vada–Fermentedcereal legume foods. Fermented dairy foods - Yoghurt - *Lactobacillus acidophilus* - *Bifidobacterium- Lactobacillus delbrueckii- Lactobacillus bulgaricus*- Standard numberof probiotics to be used - probiotic cheese . Industrial fermentors - Accessories - Types of fermentors -Stirred tank fermentors –

Packed bed fermentors - Fluidized bed fermentors - Bubble column fermentor -Air lift fermentor - Cylindrical fermentors - Flocculated cell culture fermentor - Multi phase bioreactors –Trickling bed bioreactors . Blue green algae - general characters - occurrence - Industrial importance ofBlue green algae - uses of Blue green algae.

FT406 PRODUCT DEVELOPMENT & FORMULATION
(ELECTIVE - V)

Course Description & Objective:

To impart knowledge about basics of product development, market strategy and analysis and consumer behaviour.

Course Outcomes:

Be able to apply and incorporate the principles of Food Science in practical, real-world situations and problems

1. *Integrate information about key food categories, functional ingredients, processing techniques, and packaging to develop product prototypes*
2. *Integrate information about project management, flow diagram for production of the prototype, HACCP, QA/QC, food safety, specifications of raw materials, and labeling*
3. *Develop supporting documentation for the prototype food product*

UNIT I - Product development and formulation

Introduction to the Product development and formulation - Need for Product development. New food product -Definition - General characteristics of New food product - Classes ofnew Food products - Line extensions -Repositioning of existing products - New form of existing product - Reformulation - New packaging – Innovativeproducts and Creative products and Value added products. Difference between Market and Market places;Customers and Consumers;

UNIT II - Marketing Characterstics

Marketing Characteristics of the product , Product Life cycle - profit picture. Factors affecting food productdevelopment - Corporate factors - Market place factors - technological pressures - Governmental issues andlegislations. Stages/Phases of new product development - Company objectives - Perceived needs ofMarket - Ideas - Screening - Feasibility studies - Consumer research - Financial reviewDevelopment - Production - Consumer trials -Test market . Generation of Food product Ideas - Sources of newproduct ideas - The market places - types of market places - With in the company - Outside the market place.

UNIT III - Surveys

Consumer studies - types of studies, methods of data collection - Surveys and polling -telephone and mail surveys - focussed group discussions - dephic oracle and Market placeanalysis and external environment as a source of ideas. Organizing for new product development - Concepts ofresearch and development - Creativity. Criteria of screening - general criteria for screening - Constraints – financialand technical constraints

UNIT IV - Marketing’s Perspective

Development of Strategy from Marketing’s Perspective - Marketing functions, market research, Sales andmarketability of the product. Standardization of product formulation and product design; Adaptable suitabletechnology role of Engineering in the development process. Process design, Scale - up and In– processspecifications, Manufacturing plant and Technicalaspects and-production trials.

UNIT V - Market Testing

Market testing - methods of testing –EvaluationQuality assessment of new developed productsCosting/pricing and economic evaluation of the product Product launch and commercialization of the product

FT408 EXTRUSION TECHNOLOGY
(ELECTIVE - VI)

Coure Description & Objectives:

To impart knowledge to the students about extrusion technology, principle of working, classification of extruders according to process and construction, extruded products and their processing.

Course Outcomes:

By the end of the course, the students will be able to

1. *Learn about use of extrusion technology in food industry.*
2. *Study about Extrusion cooking, preconditioning of raw material, types of extruders and operating parameters.*

UNIT I - Extrusion

Extrusion : definition, introduction to extruders and their principles, types of extruders. Extruders in the food industry: History and uses of extruders in the food industry. Single screw extruder: principle of working, net flow, factors affecting extrusion process, co-kneaders. Twin screw extruder: counter rotating and co-rotating twin screw extruder

UNIT II - Twin Extruder

Process characteristics of the twin screw extruder : feeding, screw design, screw speed, screw configurations, die design. Twin screw extruder: Barrel temperature and heat transfer, adiabatic operation, heat transfer operations and energy balances. Problems associated with twin screw extruder

UNIT III - Unit Operation in Extrusion

Pre-conditioning of raw materials used in extrusion process, Pre-conditioning operations and benefits of preconditioning and devolatilization.Interpreted-flight expanders - extruders, dry extruders. Chemical and nutritional changes in food during extrusion.

UNIT IV - Matrial Handling

Practical considerations in extrusion processing: pre-extrusion processes, cooker extruder Profiling. Practical considerations in extrusion processing: Addition and substraction of materials, shaping and forming at the die,

post extrusion processes. Breakfast cereals: introduction, type of cooking - High shear cooking process, steam cookers, low shear, low pressure cookers and continuous staem pre-cooking, available brands.

UNIT V - Processing of Breakfast Cereal

Break fast cereal processes: traditional and extrusion methods, classification of break fast cereals - flaked cereals, oven puffed cereals, gun puffed cereals, shredded products. Texturized vegetable protein: Definition, processing techniques, and foods. Snack food extrusion: Direct expanded (DX) and third generation (3G) Snacks: types, available brands, co- extruded snacks and indirect-expanded products.

FT410 ENTREPRENEURSHIP DEVELOPMENT (ELECTIVE - VI)

Course Description & Objective:

To orient the undergraduate student of B.Tech (Food Technology) to gain knowledge and understanding about the Entrepreneurship Development for moulding them as prospective and dynamic Food Entrepreneurs

Course Outcomes:

By the end of the semester, the students will be able to

1. Know the concept of Entrepreneur, Entrepreneurship and Entrepreneurship Development in relation to food processing Enterprises

2. Study the Globalization and the emerging business entrepreneurial environment in Food Industry in India and Abroad.

UNIT I - Indian Economy

Entrepreneurship Development (ED) : Assessing overall business Environment in Indian Economy.Overview of Indian social, political and economic systems and their implications for decision makingby Individual Entrepreneurs. Globalization and the emerging Business entrepreneurial environment.Globalization and the emerging Business entrepreneurial environment.

UNIT II - Managerial Characteristics

Concept of Entrepreneurship; Entrepreneurial and Managerial characteristics. Managing an Enterprise; Motivation and Entrepreneurship Development. Importance of Planning, Budgeting,Monitoring, Evaluation and Follow-up; Managing competition.

UNIT III - Govt. Schemes

Entrepreneurship Development Programmes (EDP); SWOT Analysis, Generation, Incubation and Commercialization of Ideas and Innovations.Government schemes and Incentives for promotion of Entrepreneurship.Government policy on Small and Medium Enterprises (SMEs) / Small ScaleIndustries (SSIs) / SEZ & Mega Food.Government schemes and Incentives for promotion ofEntrepreneurship. Government policy on Small and Medium Enterprises (SMEs)/Small ScaleIndustries(SSIs).

UNIT IV - Govt. Polices

Government schemes and Incentives for promotion of Entrepreneurship.Government policy on Smalland Medium Enterprises (SMEs)/Small Scale Industries (SSIs).Export and Import Policies relevant toAgriculture sector.Venture capital, Contract Farming and Joint ventures, Public-Private Partnerships.

UNIT V - Ethics

Public-Private Partnerships overview of Agri-inputs industry.Characteristics of Indian agricultural processing and Exportindustry.Social responsibility of Business.Morals and Ethics in Enterprise Management. Project-Meaning, importance, components and preparation

FT412 POST HARVEST MANAGEMENT OF FRUITS AND VEGETABLES

(ELECTIVE - VI)

Course Description Objective:*To impart knowledge to the students on the concepts of post-harvest management practices and value addition in fruits and vegetables.*

Course Outcomes:

By the end of the course, the students will be able to

1. *Know about the post harvest losses and it's management.*
2. *Know about maturity indices & harvesting indices of different fruits and vegetables.*

UNIT I - Concepts in Post Harvest Technology

Definition of fruits and vegetables - classification of fruits and vegetables based on derived planttissue and botanical classification. Post harvest technology - Introduction and Definition of Postharvest technology, over view of concept and science. Significance of Post harvest technology in lossreduction, in export, economy, and employment generation. Structure and composition of fruits andvegetables - Chemical composition and Nutritive value – Water, Carbohydrates, Protein, Lipids,organic acids, vitamins and minerals, volatiles Physical textural characteristics of fruits and vegetables

UNIT II - Physiology & Biochemistry

Physiology and biochemistry of fruit and vegetables - physiological development – Fruit ripening.physiology of respiration - Classification of fruits and vegetables based on respiratory pattern-Climacteric fruits - Non climacteric fruits - examples - Differences - Effect of ethylene - Role ofethylene in climacteric and non-climacteric fruits. Biochemistry of Respiration - Aerobic metabolism -EMP sequence - TCA cycle – Respiration quotient - Anaerobic metabolism. Fruit Maturity - Definition,methods of maturity determination, maturity indices for selected fruits and vegetables. Chemicalchanges during maturation - Fruit color, Carbohydrate content, organic acids, Aroma. Effect oftemperature on Sugar - Starch balance, Storage life of produce and Methods of cooling – Roomcooling, Forced air cooling, Hydro cooling, Contact icing, vacuum cooling, Evaporative cooling.

UNIT III - Storage Methods

Effect of water loss and humidity - Factors affecting water loss - Surface area/ volume ratio - Nature ofsurface coatings, Mechanical damage to tissue - Control of water loss – Air movement - Packaging.Storage atmosphere - CO_2 and O_2, Metabolic effects, Effect on microbial growth, Ethylene – Methodsfor modifying CO_2 and O_2 concentrations - Atmosphere control by addition of N_2 and CO_2, storage inplastic films, methods of controlling fruit ripening. Storage methods; controlled atmospheric storage,bead atmospheric storage, hypobaric storage, zero energy cool chambers

UNIT IV - Effect of effective Pot Harvest Management

Physiological disorders - Low temperature disorders - Chilling injury - Physiological disorders – mineraldeficiency disorders. Maturity-Determination of maturity - Determination of commercial maturity –Quality evaluation of fruits and vegetables- Quality standards- Post Harvest factors influencing quality.Harvesting of important fruits and vegetables - Pathology - Control of Post harvest Wastage – Postharvest handling systems adopted for citrus and apple fruits

UNIT V - Commoditeis Treatment, Packing & Storage

Commodity treatments - Controlled ripening, Controlled degreening, Control of superficial scald inApple - Calcium application to apple, Increasing water loss from Apple, Waxing, Plant growthregulators, Sprout inhibitors - Disinfestation.. Handling, Packaging and distribution - Effect ofpackaging on produce quality – Packing and Storage. Technology of storage - Methods of storage- Inground storage, Air cooled storage – Ice refrigeration - Mechanical refrigeration

COURSE CONTENTS

I SEM AND II SEM

16HS101 BASIC MATHEMATICS - I

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	15	30	10	45	-	-	-	-

Course Description and Objectives:

In this course the fundamental concepts of mathematics are introduced. A treatise of Matlab is also introduced in the practical session.

The objective of the course is to impart knowlege on progressions, partial fractions and binomial theorem. This course also deals with elementary concepts in geometry, trigonometry, differential and integral calculus. Numerical methods are also introduced for finding approximate solutions of algebraic equations. Besides, interpolation techniques and MATLAB environment are emphasized.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: apply arithmetic and geometric progressions.

CO2: understand coordinate geometry and different forms of straight lines.

CO3: use basic concepts of trigonometric ratios and identities.

CO4: understand the concept of limit, continuity and differentiability.

CO5: familiar with basic concepts of integration.

CO6: find roots of algebraic and transcendental equations.

CO7: apply some interpolation techniques.

CO8; use some commands of Matlab for mathematical computations.

SKILLS:

- ✓ *Compute sum of terms of given progression.*
- ✓ *Differentiate the given function.*
- ✓ *Evaluate the integral of given function.*
- ✓ *Interpret interpolation techniques to estimate the functional values.*

ACTIVITIES:

- *Compute the derivative and compare with Matlab output.*
- *Evaluate the integral and compare with Matlab output.*
- *Interpet the given data and estimate the functional values at a given point.*

UNIT - 1 **L-9, T-3**

MATHEMATICAL PRELIMINARIES: Progressions, partial fractions and binomial theorem.

UNIT - 2 **L-9, T-3**

TRIGONOMETRY AND GEOMETRY: Coordinate system, straight line, trigonometric functions and trigonometric identities.

UNIT - 3 **L-9, T-3**

DIFFERENTIAL CALCULUS : Limits, continuity and differentiability.

UNIT - 4 **L-9, T-3**

INTEGRAL CALCULUS: Concepts of integration - rules, integration by parts, integration by partial fractions and integration by inspection (standard forms).

UNIT - 5 **L-9, T-3**

NUMERICAL METHODS: Bisection method, Newton-Raphson method, finite differences, forward and backward difference tables, interpolation by Lagrange's method, Newton's forward and backward methods, Gauss forward and backward methods.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Introduction to MATLAB environment.

Basic mathematical operations using MATLAB.

1. Solving simple expressions.
2. Trigonometric function values.
3. Limits.
4. Continuity.
5. Symbolic differentiation-1.
6. Symbolic differentiation-2.
7. Symbolic integration-1.
8. Symbolic integration-2.
9. Real roots of functions.
10. Newton-Raphson method.
11. Interpolation.

16HS102 ENGINEERING PHYSICS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	45	30	10	-	10

Course Description and Objectives:

Technology is the experimental information for the physicist, where the theories can be tested. Recent technical developments have been the results of collaboration of physicists and engineers.

Study of engineering physics is a unique opportunity to learn the fundamental concepts of physics and apply this knowledge to both scientific and engineering problems.

The present course deals with various fields such as lasers, optical fibres, photonics, nano and funcational materials, make the students to enrich basic knowledge in various fields of physics and apply the same in engineering fields.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: understand the applications of ultrasonics and to calculate the velocity of ultrasonic waves in liquids.

CO2: acquire basic knowledge in non-destructive techniques.

CO3: understand basic concepts of laser and optical fibre which help in designing and developing new devices in emerging fields.

CO4: grasp the basics of quantum mechanics.

CO5: understand the fabrication of solar devices.

CO6: use nanoscience and technology for innovative and compact design.

CO7: demonstrate synthesis, properties and applications of nanomaterials and functional materials.

SKILLS:

- ✓ *Determine the velocity of ultrasonics in a given liquid using interferometer.*
- ✓ *Study the wavelengths of light sources and lasers.*
- ✓ *Estimate the efficiency of a given solar cell.*
- ✓ *Learn about the type of the optical fibre and their ability to propagate light waves from its numerical aperture.*
- ✓ *Know voltage – current characteristics of a given light emitting diode.*

UNIT - 1 **L-9**

ULTRASONICS : Introduction – production of ultrasonic waves, piezoelectric method, properties of ultrasonic waves, types of ultrasonic waves, determination of velocity of ultrasonic waves in solids and liquids; SONAR - medical applications.

NDT: Introduction- types, visual inspection and liquid penetrate testing; Ultrasonic testing systems; X - ray radiography.

UNIT - 2 **L-9**

LASERS : Characteristics of laser light – spontaneous and stimulated emission of radiation, He-Ne laser, CO_2 laser, semiconductor laser and applications.

HOLOGRAPHY: Holography and applications.

FIBER OPTICS : Principle of optical fibre – acceptance angle, numerical aperture, types of fibres, dispersion and attenuation in optical fibres, optical fibre communication system and fibre optic sensors.

UNIT - 3 **L-9**

QUANTUM MECHANICS : Introduction- matter waves, Schroedinger's time independent wave equation, physical significance of the wave function, particle in one dimensional potential well and tunneling phenomenon.

FREE ELECTRON THEORY OF METALS : Introduction – classical free electron theory, electrical conductivity of metal, quantum free electron theory, Fermi - Dirac distribution function and its variation with temperature

PARTICLE ACCELERATORS: Introduction- cyclotron, synchrocyclotron, betatron and applications.

UNIT - 4 **L-9**

SOLAR ENERGY: Solar radiation, photovoltaic effect, solar cells, efficiency of solar cell and solar thermal energy conversion systems.

PHOTONICS: LED, LCD, photo conducting materials, photo detectors, photonic crystals, non- linear optical behaviour of materials and applications.

UNIT - 5 **L-9**

NANO MATERIALS: Introduction, fabrication of nano materials, ball milling, sol-gel, physical and chemical properties of nano materials and applications.

FUNCTIONAL MATERIALS: Smart materials, shape memory alloys, chromic materials (thermo, photo and electro), metallic glasses, advanced ceramics, composites, fiber reinforced plastics/ metals and biomaterials.

TEXT BOOKS:

1. V. Rajendran, "Engineering Physics", 7th edition, TMH Publications, 2014
2. D.K. Bhattacharya and P. Tandon, "Engineering Physics", Oxford University Press, 2015.

REFERENCE BOOKS :

1. M.R. Srinivasan, "Engineering Physics", 1st edition, New Age International Publishers, 2008.
2. M.N. Avadhanulu and P.G. Kshirsagar, "Engineering Physics", 1st edition, S. Chand and Company Ltd, 1992.
3. S.P. Sukhatme, "Solar Energy", 2nd edition, TMH Publication, 2005.
4. Dr. Arumugam, "Materials Science", 3rd edition, Anuradha Publications, 2002.

ACTIVITIES:

- *Estimate acoustic impedance of a given material.*
- *Measurement of distances using ultrasonic range finder.*
- *Study of linear density of yarn/ fibre using Melde's experiment.*
- *Determination of refractive index of a given liquid using laser.*
- *Find height of a room using laser.*
- *Identify the type of semi-conductor using Hall effect.*
- *Study of numerical aperture of optical fibres made of different materials.*
- *Design of solar panel to obtain required voltage.*
- *Evaluate thermal conductivity of materials.*
- *Measure temperature using thermo couple.*

16HS105 TECHNICAL ENGLISH COMMUNICATION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	15	5	6	4	5

Course Description and Objectives :

To introduce students the specific use of English for the purpose of Technical Communication that would strengthen their skills in the areas of writing and speaking and thereby enable them to function effectively in their professional sphere. The teaching efforts in this course will be directed towards making students develop their technical writing skills in particular and overall language proficiency in general. It will be done by making students peruse good samples of technical writing covering a wide range of contemporary issues relevant to the engineering profession. Students will, also be revisiting, the fundamentals of grammar to get trained on use of standard English.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: acquire an understanding of the rules of grammar.

CO2: strengthen their reading and listening comprehension skills to follow the academic discourse in the engineering classroom.

CO3: have a command of basic vocabulary related to different subject areas.

CO4: have a grasp on the mechanics of writing and express their ideas through construction of simple texts.

CO5: attain language proficiency to participate in the classroom discussions.

SKILLS:

- ✓ *Apply different sub skills like skimming, scanning, reading for information, reading for inference etc to understand different kinds of text.*
- ✓ *Apply different sub skills like top down, bottoms up approachs to listening, and understand phonetic and phonological features of the English language to deconstruct long spoken discourses.*
- ✓ *Use functional vocabulary relevant to subject areas like environment, tourism, engineering, technology and media to express ideas lucidly.*
- ✓ *Use appropriate sentence structure, cohesive devices and diction to construct simple text in writing and regular correspondence like e-mails, letters etc.*
- ✓ *Capture and understand key points during class room discourses through applying sub skills of writing like note-making, paraphrasing and summarizing.*

UNIT - 1 **L-9**

- Text : **Environmental consciousness**

  (Climate change, green cover, pollution, renewable vs. non renewable energy sources (from energy unit)
- Grammar : Articles, prepositions, sentence types and construction
- Vocabulary : Root, prefixes and suffixes
- Composition : Paragraph writing (descriptive and narrative)
- Laboratory Practice : Introduction to phonetics (Organs of speech- consonants, vowels and diphthongs; Syllable, stress and intonation)

UNIT - 2 **L-9**

- Text : **Emerging technologies**
  (Solar power, cloud computing, nanotechnology, wind energy (to be covered from energy unit)
- Grammar : Time and tense (Present, past and future; Helping verbs; Modals)
- Vocabulary : Synonyms and antonyms
- Composition : Letter writing (Informal)
- Laboratory Practice : Grammar practice (Speaking of past, present and future)

UNIT - 3 **L-9**

- Text : **Travel and tourism**
  (Advantages and disadvantages of travel, tourism, *atithi devo bhava*- Tourism in India)
- Grammar : Subject-Verb agreement and sentence construction
- Vocabulary : Idioms and Phrases

  Composition : Letter writing (Formal)
- Laboratory Practice : Situational conversations – Role plays (Introducing, greeting, enquiring, informing, requesting and inviting)

UNIT - 4 **L-9**

- Text : **Engineering Ethics**
  (Challenger disaster, biotechnology, genetic engineering, protection from natural calamities, how pertinent is the nuclear option? An environment of energy (from energy unit)) Avoiding sexist language (Gender sensitization)
- Grammar : Sentence transformation (Degrees, voice, speech and synthesis)
- Vocabulary : Phrasal verbs

  Composition : Note-making on Nandan Nilekani's "In search of our energy solutions" (from energy unit) Summarizing on "Flight from conversation" (New York Times)
- Laboratory Practice : Situational conversations – Role plays (Emotions, directions, descriptions, agreements, refusals and suggestions).

ACTIVITIES:

- *Doing phonetic transcription of selected words from the list provided using talking dictionaries of AHD and CALD.*
- *Complete graded grammar exercises in Rosetta Stone.*
- *Complete graded listening and reading comprehension exercises in Rosetta Stone.*
- *Watch TED videos and making notes.*
- *Watch TED videos to paraphrase and summarize.*
- *Ad- making.*
- *Prepare brochure.*
- *Dialogue writing followed by role play.*
- *Poster designing.*
- *Team presentation with PPTs and group discussion.*

UNIT - 5 **L-9**

- Text : **Media matters:** (History of media, language and media, milestones in media, manipulation by media, thousands march against nuclear power in Tokyo (from energy unit), entertainment media and interviews)
- Grammar : Common errors
- Vocabulary : One-word substitutes
- Composition : E-mail, short message service (SMS), writing advertisements, reporting; Social Media- blogging, facebook, twitter (acceptable and non acceptable content)
- Laboratory Practice : Group discussions (topics from energy unit) – Dumping of nuclear wastes, exploration of eco-friendly energy options, lifting of subsidies on petrol, diesel, LPG etc)

16CS101 BASICS OF COMPUTERS AND INTERNET

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course provides students with a working knowledge of the terminology, processes and components associated with computers and internet. Students will get exposure to building blocks of computers, operating systems, application software, networking, internet, world wide web, security, maintenance, information systems and the application development processes.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: understand the terms and concepts of computer science and information technology (hardware, software, networking, security, internet/web and technologies).

CO2: use the products and services of computers.

CO3: use internet/web services as a resource for developing shared applications.

CO4: install different operating systems and application software.

SKILLS:

- ✓ *Assemble and disassemble the personal computer system.*
- ✓ *Install different desktop operating systems.*
- ✓ *Use the basic text processing, simple data analysis and data presentation tools.*
- ✓ *Configure network parameters.*
- ✓ *Secure the personal computer and information from various external threats.*

ACTIVITIES:

- *Prepare a report on various generations of computers and their peripherals.*
- *Disassemble and assemble of a personal computer system.*
- *Install the Linux operating system and other software required in a personal computer system.*
- *Connect the system to an ethernet and configure the same.*
- *Prepare an MS word document.*
- *Prepare a spread sheet with various mathematical operations, charts, sorting etc.*
- *Make a report on power point presentation for the given topic.*

UNIT - 1 **L-10**

COMPUTING SYSTEMS : Introduction to computer, computers for individuals, importance of computers, parts of computer system, memory devices, input and out devices, types of monitors, types of printers, number systems, bits and bytes, text codes and types of processors.

UNIT - 2 **L-10**

OPERATING SYSTEMS : Types of operating systems, user interfaces, PC operating systems, network operating systems, types of software, programming languages, compiler and interpreter, program control flow and algorithm.

UNIT - 3 **L-8**

NETWORKS AND DATABASES : Networking basics, uses of network, types of networks, network hardware, introduction to data bases and database management systems.

UNIT - 4 **L-8**

INTERNET AND WWW : Internet's services, world wide web, browser setups, using search engine, email and other internet applications.

UNIT - 5 **L-9**

CYBER SECURITY : The need of computer security, basic security concepts, threats of users, online spying tools, threats to data, cybercrime and protective measures.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- know the usage of the computer systems.
- setup the IDEs for the computer programming languages.
- get exposure on office automation tools like Microsoft Word, Excel, and power point.
- identify the different computer system and data threats and also protect them by installing antivirus software.

LIST OF EXPERIMENTS Total hours: 30

1. Demonstrate the personal computer peripherals and get a report on each peripheral.
2. Demonstrate the personal computer assembling procedure and do the same.
3. Install wide varieties of free and open source operating systems.
4. Demonstrate network interface card (NIC) configuration and any internet browsers options setup.
5. Demonstrate the Java development kit (JDK) installation and environmental variable (PATH) setup.
6. Demonstrate the following experiments using Office automation tools
   a. Text formatting and table.
   b. Mathematical equations.
   c. Watermarking using analysis tool.
   d. Calculate student mark details.
   e. Create four types of charts.
   f. Import external data, sort and filter using powerpoint tool.
   g. Create text and images with effects.
   h. Create animation and sound effects.
7. Demonstrate the installation of anti-virus software to detect different types of virus programs.

TEXT BOOK :

1. P. Norton, “Introduction to Computers”, 7th edition, Tata-McGraw Hill, 2010.

REFERENCE BOOKS:

16CS102 COMPUTER PROGRAMMING

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	5

Course Description and Objectives:

This course is aimed at offering fundamental concepts of programming language to the students. It starts with the basics of C-programming and deals with the structure and various attributes required for writing a ‘C’ program. It also introduces various operators and control statements used in programming. Then it switches to functions and arrays. It goes on with strings, pointers, files and the user defined data types. As a first-level course in computer science, it forms the basis to understand usage of various attributes in writing a program.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: understand the basic terminology used in computer programming to write, compile and debug programs in ‘C’ language.

CO2: use different data types to design programs involving decisions, loops and functions.

CO3: understand the allocation and usage of dynamic memory.

CO4: understand the usage of files and structures.

SKILLS:

- ✓ *Identify suitable data types for an application.*
- ✓ *Apply control statements for decision making problems.*
- ✓ *Use multidimension array for matrix application.*
- ✓ *Design a program to calculate average of a class.*
- ✓ *Analyze the difference between static and dynamic memory allocation.*

UNIT - 1 **L-9, T-3**

INTRODUCTION TO C PROGRAMMING : Structure of C program- comments, processor statement, function header statement, variable declaration statement and executable statement; C character set - constants, identifiers, operators, punctuations, keywords, modifiers, identifiers, variables, c scopes, basic data types, type qualifiers, storage classes, reading and writing characters and formatted I/O.

UNIT - 2 **L-9, T-3**

OPERATORS AND CONTROL STATEMENTS : Operators- assignment, arithmetic, relational, logical, bitwise, ternary, address, indirection, size of, dot, arrow and parentheses operators; Expressions precedence of operators and associative rules; Control statements- category of statements, selection, iteration, jump, label, expression and block.

UNIT - 3 **L-9, T-3**

FUNCTIONS AND ARRAYS : Function- declaration, prototype, definition, calling by value and call by address, standard library functions and recursive functions; Array- declaration, initialization, reading, writing, accessing and passing as a parameter to functions, 2D-arrays and multidimensional arrays.

UNIT - 4 **L-9, T-3**

STRINGS AND POINTERS : Strings- declaration, string library functions, array of strings and command line arguments; Pointers- declaration, initializing pointers, multiple indirection, relationship between arrays and pointers; Scaling up- array of arrays, array of pointers, pointer to a pointer, pointer to an array; pointer to functions and dynamic memory allocation functions.

UNIT - 5 **L-9, T-3**

STRUCTURES AND FILES : Structures - declaration, initialization and accessing, array of structures and passing structures to functions, structure pointers, arrays and structures within structures, unions, bit-fields, types and enumerations; Files - I/O and processing operations on text and binary files; Pre-processor directives.

LABORATORY EXPERIMENTS

Course Outcomes:

Upon successful completion of this course, the student will be able to:

- write, compile and debug programs in C language.
- formulate problems and implement algorithms in C.
- choose programming components that efficiently solve computing problems in real-world.

LIST OF EXPERIMENTS Total hours: 30

1. Compute the factors of a number.
2. Compute the average of ‘n’ numbers.
3. Find whether a number is palindrome or not.
4. Find whether a number is a power of 2 or not.
5. Compute the factorial of a number.
6. Implement any kind of operation (+,-,*,/,%) using a switch case.

ACTIVITIES:

- *Implement matrix operations.*
- *Implement malloc and calloc functions.*
- *Copy the content of one file into the other.*
- *Implement string manipulations functions.*

7. Swap two values useing call by value and call by reference.
8. Using structure of arrays.
9. Find the reversal of a number.
10. Find the frequency of each number in the array.
11. Which takes 0's and 1's as input and the array should consist of all 0's first and then 1's.
12. Copy the first 10 words of a file into the other file.
13. Count the number of words in a file.
14. Create a structure which stores the student's information in a class.
15. Reverse the contents of the array.
16. Implement pointer of pointers.
17. Give n^{th} term of the Fibonacci number.
18. Find the factorial of a number using recursion.
19. Find the number of vowels in a file.
20. Access the structure and union members.

16EE101 BASICS OF ENGINEERING PRODUCTS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	30	5	40	-	8	5	-

Course Description and Objectives:

This course enables the students to understand the basics of civil, mechanical, electrical and electronics systems and components used in day-to-day life. It deals with construction materials, power generation principles and working of a few commonly used household appliances. Besides, the student will be able to identify/appreciate various concepts, service and maintainance of engineering products.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: gain knowledge and hands-on experience on various engineering products.

CO2: install, operate, maintain and troubleshoot basic mechanical, electrical and electronic appliances.

CO3: understand the concept of conservation of energy.

CO4: gain awareness on choosing appropriate construction materials.

SKILLS:

- ✓ *Identify UPS requirements for a given load.*
- ✓ *Provide a lighting scheme for specific working environment.*
- ✓ *Design a composition of hHeating element for a particular application.*
- ✓ *Troubleshoot issues relating to immersion heater and induction heater.*
- ✓ *Provide an earthing for domestic outlet.*
- ✓ *Select, configure and maintain a few engineering appliances such as TV, radio, telephone, mobile phone, wifi router, micro oven, PA system, etc.*

ACTIVITIES:

- *Trouble shooting of immersion heater and induction heaters.*
- *Disassemble and Assemble of Domestic Appliances such as Mixer Grinder, Fan etc.,*
- *Provide Earthing for Domestic Outlet.*
- *Design Electric Wiring system for a prototype house.*
- *Design UPS for a defined load.*
- *Practice assembly of a FM radio.*
- *Configure a Wifi Router for required number of users.*

UNIT - 1 **L-9**

WORKING PRINCIPLE OF AC, REFRIGERATOR, PUMPS, IC ENGINES AND SCREW JACK: Working principle of air-conditioner and refrigerator- components, assembly and disassembly, working principle of centrifugal and reciprocating pumps; Types, parts and applications, working principle of screw jack and its components; Working principle of IC engines- 2 stroke and 4 stroke.

UNIT - 2 **L-10**

BRICKS : General, qualities and classification of bricks; Tests for bricks; Size and weight of bricks; Timber- definition, qualities of good timber, decay of timber and advantages of timber in construction.

CEMENTS : Types and composition of cement, setting of cement, tests for physical properties of cement, and different grades of cement.

AGGREGATES : Classification of aggregates, source, size and shape of aggregates; Tests for aggregates.

STEEL: Types of steel, physical properties and mechanical properties of steel. Simple layout design, paints, tiles, fittings, ventilation, furniture and green house aspects.

UNIT - 3 **L-8**

ELECTRIC ENERGY SYSTEMS : Overview of power system structure; Conventional and non conventional generations - types of turbines, generators, substations, towers, earthing procedure, protection schemes, single phase and three phase systems.

Methods of electrical wiring systems - wiring procedure and calculations; Wiring methods.

Uninterruptible power supply (UPS)- components in UPS, its functionality and calculation of ratings for UPS components to a specific load.

UNIT - 4 **L-10**

LIGHT : Light energy, evolution of light sources, working of incandescent, fluorescent, MV, SV and LED lamps, comparison and applications.

HEAT : Heat energy, modes of heat transfer, resistance and induction heating, comparison and applications.

MOTOR : Electric motors, classification, construction and working principles of motors used in domestic applications, mixer grinder, ceiling and exhaust fan, hair dryer, washing machine, water pump, air coolers, vacuum cleaner, computer cooling motor and electric bike.

UNIT - 5 **L-8**

HOUSE HOLD ELECTRONIC APPLIANCES: Working principles of television, radio, remote control, telephone, microwave oven, cell phone, PA system, induction stove, wifi router and DTH.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Demonstration of Modelling / functioning / disassembly / assembly / fault rectification / understanding of the following.

1. Air-conditioners and Refrigerators
2. 2 Stroke and 4 Stroke Engines
3. Reciprocating Pumps
4. Power Screw Jack
5. Size and Water absorption capacity of Bricks
6. Initial and final setting time of Cement
7. Toughness value of coarse aggregates
8. Bulking of Sand
9. Earthing Schemes
10. Electric Wiring
11. UPS system
12. Immersion Heater, Induction Heater and Iron Box.
13. Ceiling Fan and Mixer.
14. Television
15 Radio
16. Remote Control
17. Telephone
18. Fax Machine
19. Mobile Phone
20. PA System

16HS104 ENGLISH PROFICIENCY AND COMMUNICATION SKILLS

Hours Per Week :

L	T	P	C
0	-	2	1

Total Hours :

L	T	P
0	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To equip students with functional English by exposing them to a wide range of language use in different contexts and thereby encourage them to use the language comfortably in real life situations. Students will strengthen their comprehension skills of listening and reading by acquiring adequate vocabulary through perusing authentic materials gathered from news papers, journals and other mass communication media.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: use functional English to speak and express themselves in different social contexts

CO2: write simple letters, narratives, factual reports and descriptive passages for both academic and non-academic purposes in English.

CO3: gain proficiency to undergo Preliminary English Test (PET), an Intermediate Level English Certification Test administered by Cambridge English Language Assessment, UK.

SKILLS:

- ✓ *Use appropriate words in right order for effective sentence formation, and writing short texts.*
- ✓ *Read and extract information from different texts & draw inferences by understanding elements like tone and transitional words.*
- ✓ *Understand short and long spoken discourses through analysis of elements like stress and intonation.*
- ✓ *Articulate clearly thoughts and ideas on simple every day topics.*

UNIT - 1 **P-6**

Functions : Introducing self/others; Expressing needs/feelings/opinions (SWOT Analysis)

Skill Focus:

Reading	-	Understanding factual information
Writing	-	Word order and sentence formation
Listening	-	Decoding for meaning following elements of stress, intonation and accent
Speaking	-	Articulating syllables clearly, speaking fluently with correct pronunciation
Vocabulary	-	Discerning to use right word for the given context
Grammar	-	Spellings, use of nouns, adjectives, verbs, prepositions in the sentence structure

Practice: Objective PET Units 1 - 6

UNIT - 2 **P-6**

Functions : Defining and describing people, places, things and process.

Skill Focus:

Reading	-	Inferences from sentences and short messages – true/false
Writing	-	Rewording, sentence transformation and convincing
Listening	-	Understanding the short messages and conversations
Speaking	-	Role plays and short conversations
Vocabulary / Grammar	–	Use of adjectives/adverbs, comparatives and superlatives
Practice	:	Objective PET Units 7 – 12

UNIT - 3 **P-6**

Functions : Describing spatial and temporal relations; Giving directions/ instructions

Skill Focus :

Reading	-	Reading between the lines, inferences, true/false
Writing	-	Developing hints - Writing short messages/paragraphs
Listening	-	Searching for factual information - Gap filling
Speaking	-	Snap talks, JAM and elocution
Vocabulary / Grammar	-	Prepositions, phrasal verbs; PET word list

Practice: Objective PET Units 13 - 18

UNIT - 4 **P-6**

Functions : Narrating, predicting, negotiating and planning

Skill Focus:

Reading	-	Reading for evaluation and appreciation, comprehension
Writing	-	Letters – e-mails – 7 C's
Listening	-	Following long conversations/interviews

ACTIVITIES:

- *SWOT Analysis.*
- *Snap talks.*
- *Spell Bee.*
- *Short conversations.*
- *Role play.*
- *Quiz.*
- *Elocution.*
- *JAM.*
- *Group. Discussion Debate.*
- *Team presentations.*

Speaking	-	Discussions, debate and descriptions
Vocabulary / Grammar	-	Modals, conditionals and verb forms (time and tense)
Practice:		Objective PET Units 19 – 24

UNIT - 5 **P-6**

Functions: Requesting, denying, suggesting and persuading

Skill Focus:

Reading	-	Understanding factual information
Writing	-	Short stories and explanatory paragraphs
Listening	-	Inferences from long speeches/conversations
Speaking	-	Announcements and presentations
Vocabulary / Grammar	-	Punctuation and cloze tests

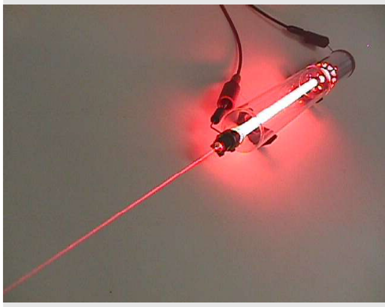
Practice: Objective PET Units 25 – 30

TEXT BOOK:

1. L. Hashemi and B. Thomas, *"Objective PET"*, Student's Book with Answers, 2nd edition, Cambridge University Press, 2015.

REFERENCE BOOKS :

1. Cambridge Preliminary English Test Without Answers 8.
2. A. Capel and R. Nixon, *"Introduction to PET"*, Oxford University Press.



16HS110 ENGINEERING PHYSICS LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course Description and Objectives:

This lab is intended to make the students realize the theoretical concepts of physics having hands on experience in conducting the following experiments.The students have to perform at least 10 experiments from the list of experiments.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: realize the concept of resonance by conducting the experiments of AC sonometer and Melde's experiment.

CO2: acquire the knowledge on magnetic field theory, thermal conductivity by conducting experiments of field along the axis of a circular coil and thermal conductivity of bad conductor

CO3: understand the concepts of light by conducting the experiments of determination of wave length, numerical aperture of an optical fibre and also from V–I characteristics of Solar cell and LED.

LIST OF EXPERIMENTS

1. Determination of velocity of ultrasonic waves in liquids.
2. Melde's experiment - transverse and longitudinal modes.
3. Determination of wave length – Helium - Neon laser.
4. Determination of Planck's constant.
5. Determination of Frequency of alternating current.
6. Field along the axis of a circular coil – Stewart and Gee's apparatus.
7. Band gap of semiconductor.
8. Hall coefficient.
9. Thermal conductivity of bad conductor - Lee's method.
10. Optical Fibre – Determination of numerical aperture.
11. Solar Cell – efficiency.
12. Study of V – I characteristics of LED.
13. Seebeck effect.

REFERENCE BOOKS :

1. Jayaraman, "Engineering Physics Laboratory manual", 1st edition, Pearson Education, 2014.
2. Engineering Physics Laboratory Manual – Department of Physics, VFSTR University, 2016.

16HS106 BASIC MATHEMATICS – II

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

This course offers basic concepts on matrices, system of equations, differential equations of first and higher order. Further, numerical methods to solve differential equations are introduced.

The objective of the course is to provide the knowledge on the properties of matrices and solving system of equations using matrices. It is also aimed to offer various methods (analytical as well as numerical) to solve first and second order ordinary differential equations.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: understand the basic concepts, properties and operations on matrices.

CO2: determine when a system of equations is consistent or not and solve it whenever possible.

CO3: determine when the matrix has an inverse and find it when it exists.

CO4: identify the method to solve the differential equations.

CO5: find the complete solution of a homogeneous and non homogenerous differential equations with constant coefficients.

CO6: evaluate integrals and solving differential equations using numerical methods.

CO7 compare the solutions of differential equations by numerical methods with exact solution of that equation using MATLAB.

SKILLS:

- ✓ *Compare the inverse of matrix.*
- ✓ *Solve given system of linear equations.*
- ✓ *Solve given differential equations.*

UNIT - 1 **L-9, T-3**

MATRICES: Definition, types of matrices, algebra of matrices, determinant, minor, cofactor, adjoint, and inverse of a matrix; Elementary row operations, inverse by row operations, rank, determination of rank using Echelon form and normal form.

UNIT - 2 **L-9, T-3**

SYSTEM OF EQUATIONS: System of linear equations, consistency of system of equations, solution by Cramer's rule, matrix inversion method, Gauss-Jordan method and Gauss elimination method.

UNIT - 3 **L-9, T-3**

FIRST ORDER ORDINARY DIFFERENTIAL: Introduction, variable separable, linear equations, Bernoulli equation, homogenous equations and non-homogenous equations.

UNIT - 4 **L-9, T-3**

SECOND ORDER ORDINARY DIFFERENTIAL EQUATIONS : Linear differential equations of second order with constant coefficients with RHS of type e^{ax}, $\sin ax$, $\cos ax$, x^n.

UNIT - 5 **L-9, T-3**

NUMERICAL METHODS - II: Numerical integration by trapezoidal rule and Simpson's rules; Numerical solutions to Differential equations - Euler's method and Runga-Kutte method.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Matrix algebra.
2. Rank of a matrix.
3. System of equations (Direct method).
4. System of equations (Cramer's rule).
5. System of equations (Matrix inversion method).
6. Solutions of first order ODE.
7. Trapezoidal rule.
8. Simpson's one-third rule.
9. Simpson's three-eight rule.
10. Euler's method.
11. RK Method.

Text BOOKS :

1. H. K. Dass and Er. R. Verma, "Higher Engineering Mathematics", S. Chand and Co., 3rd edition, 2014.
2. B. S. Grawel, "Engineering Mathematics", Khanna Publishers, 44th edition, 2014.

Reference BookS :

1. K. S. Rao, "Numerical Methods", 3rd edition, PHI Publishers, 2007.
2. R. Pratap, "Getting started with MatLab", Oxford University Publication, 2009.

ACTIVITIES:

- *Compute the inverse of matrix and compare with MATLAB output.*
- *Solve given system of linear equations and compare with MATLAB output.*
- *Solve given differential equations and compare with MATLAB output.*

16HS107 ENGINEERING CHEMISTRY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	-	10	-	-

Course Description and Objectives:

This course aims to develop fundamental knowledge on new engineering materials and their significance in science and engineering applications. In addition, characterization of materials using basic and advanced experimental techniques is also offered. Besides, analysis of water sample and treatment method for domestic, commercial and industrial applications are also covered.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: understand the limitations of using hard water for domestic and industrial purposes.

CO2: choose and apply suitable methods to soften the hard water for industrial and domestic applications.

CO3: understand electrochemistry and its importance for applications such as fuel cells, modern lithium ion batteries etc.

CO4: understand the types of corrosion and their implications followed by their control and prevention methods.

CO5: familiarize the preparation, properties and applications of various polymers.

SKILLS:

✓ *Analyse the total hardness of water sample.*

✓ *Understand the basic principles involved in various batteries.*

✓ *Understand the mechanisms of corrosion and various controlling methods.*

✓ *Synthesize various polymers.*

✓ *Identify the functional groups present in chemical compounds using Infrared and Ultraviolet instruments.*

UNIT - 1 **L-9**

WATER TECHNOLOGY : Introduction, WHO, BIS standards of water; Hardness of water-determination of hardness by EDTA (numerical problems), disadvantages of hard water, scales and sludges, caustic embrittlement, boiler corrosion, priming and foaming; Softening methods - zeolite process, ion exchange process; Desalination of brackish water- reverse osmosis and electrodialysis.

UNIT - 2 **L-9**

ELECTRO CHEMISTRY: Electrode potential; Electrochemical series; Nernst equation; Reference electrodes - Calomel and standard hydrogen electrode, ion selective electrode and glass electrode; Determination of pH by pH meter, primary cell and secondary cell (lead-acid storage cell and lithium ion battery); Fuel cell - hydrogen oxygen and methanol oxygen.

UNIT - 3 **L-9**

SCIENCE OF CORROSION : Introduction, dry corrosion, wet corrosion and mechanisms of wet corrosion; Bimetallic corrosion - concentration cell corrosion; Factors influencing the rate of corrosion; Corrosion control methods - cathodic protection, electroplating, electrolessplating and corrosion inhibitors.

UNIT - 4 **L-9**

POLYMERS: Introduction; Types of polymerization - preparation, properties and applications of polyethylene, PVC, teflon, bakelite, urea, formaldehyde and silicones; Rubber – vulcanization; Synthetic rubbers - buna-S, buna-N and neoprene; Introduction to conducting polymers - poly thiophene.

UNIT - 5 **L-9**

INSTRUMENTAL TECHNIQUES: Interaction of radiation with matter, UV - Visible Spectroscopy, Beer - Lambert's law, qualitative and quantitative analysis; Block diagram of UV-Visible spectrophotometer; IR Spectroscopy - types of vibrations and block diagram of IR spectrophotometer.

TEXT BOOKS :

1. P.C Jain and M. Jain, "Engineering Chemistry", 17th edition, Dhanpat Rai Publications, 2010.
2. S. Chavala, "A Text book of Engineering Chemistry Engineering Materials and Applications", 3rd edition, Dhanpat Rai Publications, 2015.

REFERENCE BOOKS:

1. K.S. Maheswaramma and M. Chugh, "Engineering Chemistry", 1st edition, Pearson publication, 2015.
2. M.R. Senapati, "Advanced Engineering Chemistry", 2nd edition, Lakshmi Publications, 2006.
3. H. W. Wilard and DeMerit, "Instrumental methods of Analysis", 7th edition, CBS Publications,1986.
4. G. Raj and C. Anand, "Instrumental Methods of Analysis", 5th edition, Himalaya Publications, 2007.
5. J.D. Bares, M.Thomas, B. S. Sankar, J.Mendham and R.C Denney, "Vogel's Text book of Qualitative Chemical Analysis", 6th edition, Pearson Publications, 2009.
6. Dr.S. Rattan, "Experiments in Applied Chemistry", S.K. Kataria and Sons Publications, 2008.

ACTIVITIES:

- *Collect water samples from different villages near VFSTR University and determine the total hardness, and total alkalinity.*
- *Present the water analysis report to the villagers and suggest proper measures to be taken.*
- *Measure the rate of corrosion of iron objects by weight loss method.*
- *Identify some of the functional groups like carboxylicacid, aldehyde and ketones by I.R. Spectroscopy.*
- *Collect water sample from different villages and estimate the fluoride present in the raw water and suggest some steps for the removal of fluoride.*

16ME101 ENGINEERING GRAPHICS

Hours Per Week :

L	T	P	C
1	-	3	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
15		45	6	15	-	5	-	-

Course Description and Objectives:

The main aim of this course is to familiarize the students with the conventional concepts of engineering drawing and computer aided applications in various fields. Engineering graphics is an "International language of Engineers". It is the most effective method of communicating technical ideas in a 2D and 3D format.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: sketch engineering objects in the freehand mode.

CO2: create geometric construction with hand tools.

CO3: create dimensions of objects.

CO4: prepare plan and elevation of any pictorial view.

CO5: draw freehand lettering.

CO6: make isometric sketches using graphics.

CO7: draw orthographic multi-view sketches using graphics.

SKILLS:

- ✓ *Draw free hand sketches, layouts, circuit diagrams, plan and elevations.*
- ✓ *Draw geometrical objects like polygons, solids of different types.*
- ✓ *Visualize the objects in real time situations.*
- ✓ *Develop 3D views (isometric views).*

UNIT – 1 **L-3, P-10**

INTRODUCTION TO ENGINEERING DRAWING: Types of lines, Lettering, Dimensioning, Construction of polygon and conics (Ellipse, Parabola and Hyperbola by general method), Ellipse by oblong method.

UNIT – 2 **L-3, P-8**

ORTHOGRAPHIC PROJECTIONS: Principle of projection, Planes of projections, Projections of points, Projection of straight lines, Inclined to one plane and both the planes, Projections of planes, Simple planes, Planes inclined to one reference planes.

UNIT – 3 **L-3, P-8**

PROJECTIONS OF SOLIDS: Projections of prisms, Pyramids, Cylinders, Cones, Solid axis inclined to one plane.

UNIT – 4 **L-3, P-10**

AUTOCAD: Introduction to AutoCAD

ISOMETRIC VIEWS: Isometric drawing of simple objects, Isometric view of prisms, Pyramids, Cone and cylinder, Simple orthographic views into isometric views through AutoCAD.

UNIT – 5 **L-3, P-9**

ORTHOGRAPHIC VIEWS: Conversion of pictorial views into orthographic views through AutoCAD.

TEXT BOOKS:

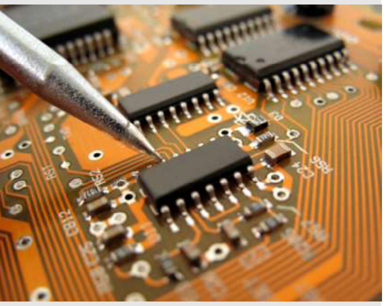
1. N.D.Bhatt, "Engineering Drawing", 53rd edition, Charotar Publication, 2014.
2. Basant Agrawal, C.M.Agrawal "Engineering Drawing" , 2nd edition., Tata McGraw Hill,2014.

REFERENCE BOOKS:

1. J. hole, "Engineering Drawing", 2nd edition, Tata McGraw Hill, 2008.
2. K.L. Narayana, "Engineering drawing", 2nd edition, Scitech Publications, 2008.

ACTIVITIES:

- *Draw line diagram of different machineries.*
- *Draw plan and elevations of buildings and engineering products.*
- *Understand, visualize 3-D components/ products and develop drawings.*
- *Draw different curves used in several engineering applications such as bridges, dams etc.*



16EE102 BASICS OF ELECTRICAL AND ELECTRONICS ENGINEERING

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	5

Course Description and Objectives:

This course provides an in-sight into the functioning of basic electrical components like resistor, inductor and capacitor. It deals with the constructional and operational details of both DC and AC machines. It also deals with the basic electronic components like P-N junction Diode, Zener diode, transistor and their characteristics.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: understand the notation and usage of components in electric circuits.

CO2: analyze AC (single and three phase) and DC using different methods and laws.

CO3: operate various electrical machines.

CO4: understand the concepts of semiconductor devices and their operation.

SKILLS:

- ✓ *Distinguish between linear and nonlinear elements by looking at VI characteristics.*
- ✓ *Develop a simple loop generator.*
- ✓ *Design a voltage regulator using Zener diode.*
- ✓ *Design a half wave rectifier using PN junction diode.*
- ✓ *Design a full wave rectifier using PN junction diodes.*

UNIT - 1 **L-9**

FUNDAMENTALS OF DC CIRCUITS: Circuit Concepts; Concepts of network- active and passive elements, voltage and current sources, concept of linearity and linear network, unilateral and bilateral elements, R, L and C as linear elements; Ohm's Law; Kirchhoff's Laws; Application to simple series, parallel circuits, mesh and nodal analysis of simple resistive circuits (simple numerical problems).

UNIT - 2 **L-9**

FUNDAMENTALS OF AC CIRCUITS: Generation of AC voltage - frequency, average value, RMS value, form factor, peak factor for sinusoidal only; Phasor representation of alternating quantities; Analysis of simple series and parallel AC circuits (simple numerical problems).

BALANCED THREE PHASE SYSTEMS: Relation between phase and line quantities of voltages and currents in star and delta connected systems (elementary treatment only).

UNIT - 3 **L-9**

FUNDAMENTALS OF ELECTROMAGNETISM: Concepts of magneto motive force, reluctance, flux and flux density, concept of self Inductance and mutual Inductance, coefficient of coupling (only elementary treatment and simple numerical problems).

TRANSFORMERS: Principle of operation of single phase transformer, constructional features, EMF equation (simple numerical problems).

UNIT - 4 **L-9**

DC MACHINES: Constructional details of a DC machine, DC generator, principle of operation; EMF equation, types of DC generators (simple numerical problems).

DC motor- principle of operation, torque equation, types of DC motors (simple numerical problems)

AC MACHINES: Principle of operation of three phase induction motors, slip ring and squirrel cage motors, torque equation, constructional details of synchronous machine.

UNIT - 5 **L-9**

SEMICONDUCTOR DEVICES: Classification of solids based on energy band theory; Intrinsic and extrinsic semiconductors, P-type and N-type semiconductors, P-N junction diode and its characteristics; Half and full wave rectifiers; Zener diode and its characteristics; Voltage regulator; Bi polar junction transistor, operation, types and applications.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Verification of Ohm's law.
2. Verification of Kirchhoff's current law.
3. Verification of Kirchhoff's voltage law.
4. Measurement of energy in single phase resistive load circuit.
5. Measurement of Power in single phase resistive load circuit.
6. Transformation ratio of a single phase transformer at different loads.
7. Verification of PN junction diode characteristics under both forward and reverse bias.

ACTIVITIES:

- *Decode the value of resistors.*
- *Design and fabricate a simple loop permanent magnet generator.*
- *Design and fabricate a simple air cored transformer.*
- *Fabricate full and half wave rectifiers using PN junction diodes.*
- *Fabricate a voltage regulator using Zener diode.*

8. Verification of Zener diode characteristics under both forward and reverse bias.
9. Implementation of half wave rectifier without filter.
10. Implementation of full wave rectifier without filter.

TEXT BOOKS:

1. V.K. Mehta, “Principles of Electrical Engineering and Electronics”, 3rd edition, S. Chand Publications, New Delhi, 2010.

16HS111 ENGINEERING CHEMISTRY LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	30

Course Description and Objectives:

This course is aimed at enlightening the importance of theoretical concepts of chemistry and experimental techniques for characterization of materials.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: analyse the total hardness present in water samples.

CO2: determine the total alkalinity of water used in industries.

CO3: acquire the knowledge on polymers used as insulators.

CO4: familiarize advanced techniques in chemical analysis using conductometer and pH meter.

LIST OF EXPERIMENTS

1. Determination of total alkalinity of water.
2. Estimation of total hardness of water.
3. Find the percentage of available chlorine in bleaching powder.
4. Estimation of Fe (II) by dichrometry method.
5. Preparation of phenol - formaldehyde resin.
6. Synthesis of urea- formaldehyde resin.
7. Estimation of concentration of acid by pH metry.
8. Determination of strength of acid by conductometry.
9. Measurement of Mn^{+7} by colorimetry.
10. Determination of concentration of a salt by ion exchange method.
11. Find the concentration of Mn^{+7} and Cr^{+6} by UV-visible spectrophotometry.
12. Find the rate of corrosion by weight loss method.

TEXT BOOKS :

1. J.Mendham, R.C.Denney, J.D. Bares, M.Thomas and B.S. Sankar, “Vogel’s Text book of qualitative Chemical Analysis”, Volume I, Pearson Publications, 2009.
2. Dr. S. Rattan, “Experiments in Applied Chemistry”, S.K. Kataria and Sons Publications, 2008.

16HS109 ENVIRONMENTAL SCIENCE AND TECHNOLOGY

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
30	-	-	10	20	4	-	4	-

Course Description and Objectives:

Environmental science and technology offers technological aspects of environmental science and in maintaining environmental integrity in relation to human development. It helps every engineer to plan appropriate strategies for addressing environmental issues and also contribute to the development of innovative technologies for solving such issues. It produces professionals who will ensure sustainable development of the nation in general and environmental in particular.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: observe and integrate the diverse information from sources outside the classroom.

CO2: think critically, creatively, resourcefully and strategically, including identifying steps needed to reach goals, manage projects, evaluate progress, and adapt approaches, developing both self reliance and civic mindedness.

CO3: adapt eco-friendly technologies in order to maintain hygienic conditions.

CO4: understand the human activities that are detrimental to environment.

CO5: collaborate across diverse disciplines to identify and create solutions that conserve and help maintain biodiversity in the long term.

CO6: discuss the issues involved in the generation of renewable energy resources.

SKILLS:

- ✓ *Understand structural relationships, abstract models, symbolic languages and deductive reasoning.*
- ✓ *Gain perspectives to adrress the challenges, improvise and devise solutions.*
- ✓ *Identify solutions to environment and development issues, using planning, analysis, modeling, and new approaches.*
- ✓ *Acquire fieldwork techniques to study, observe and prepare documents, charts, PPTs, Models etc.*
- ✓ *Understand how natural resources should be used judiciously, to protect biodiversity and maintain ecosystem.*

UNIT - 1 **L-6**

NATURAL RESOURCES : Environmental Studies- definition, scope and its importance; Need for public awareness, natural resources, forest resources and deforestation; Water resources - properties and conflicts; Mineral resources - extraction and impacts; Food resources - modern agriculture methods, fertilizer-pesticide problems, water logging and salinity; Energy resources - renewable and non-renewable energy resources, harness technology, solar energy technologies; Land resources - land degradation, soil erosion; Role of an individual in conservation of natural resources.

UNIT - 2 **L-6**

ECOSYSTEMS AND BIODIVERSITY : Ecosystem - concept, structure and functions of an ecosystem; Food chains, food webs, ecological pyramids, energy flow, energy regulation and succession; Biogeochemical cycles; Aquatic ecosystems; Biodiversity - introduction, bio-geographical classification, values of biodiversity, biodiversity at global, national and local levels, hot-spots of biodiversity, threats to biodiversity, endangered and endemic species of India and conservation of biodiversity.

UNIT - 3 **L -6**

WASTE MANAGEMENT AND GREEN TECHNOLOGY : Solid waste management - causes, effects and control measures of municipal and industrial wastes; Pollution - air, water, thermal, soil and noise pollutions; Role of an individual in prevention of pollution; Remote sensing / GIS - introduction, definitions, applications of the remote sensing; Innovative practices-objectives, innovative practices in agriculture, forest-community and bio-villages; Green technology for sustainable development, life cycle assessment and its concept.

UNIT - 4 **L-6**

SOCIAL ISSUES AND EIA : Sustainable development, water conservation, cloud seeding, rainwater harvesting methods, watershed management, global warming, acid rain, ozone layer depletion; Environmental legislation; wildlife protection act, water act, forest conservation act, air act, environmental protection act; Environmental impact asssssment (EIA) - introduction, definition of EIA and EIS, scope and objectives, importance of EIA in proposed projects/industry/developmental activity.

UNIT - 5 **L-6**

ENVIRONMENTAL SANITATION : Food sanitation **-** food and drugs act, food preservations, milk sanitation, tests for milk, pasteurization of the milk; Water, air, soil and food borne diseases; Maintenance of sanitary and hygienic conditions; Role of youth in the development; Promoting activities -youth as initiators and activities; Field work/environmental visit - visit to a local area to document environmental assets river/ forest/grassland/hill/mountain; Study of local environment - common plants, insects, birds; Study of simple ecosystems - pond, river, hill slopes etc., Visit to industries/water treatment plants/effluent treatment plants.

TEXT BOOKS:

1. A. Kaushik and C.P. Kaushik, “Perspectives in Environmental Studies”, 5th edition, 2016.
2. B. Joseph, “Environmental studies”, 2nd edition, McGraw Hill Education, 2015.

REFERENCE BOOKS:

1. Dr. M. Chandrasekhar, “A Text book of Environmental Studies”, HI-TECH publications, 2006.
2. Dr. M. Anji Reddy, “A Text book of environmental science and Technology”, B S Publications, 2008.
3. Dr. K. Mukkanti, “A Text book of Environmental Studies”, S.Chand and Company Ltd, 2009.
4. EHILRS and ST, “Text book of Municipal and Rural Sanitation”, M.S Hill, 1998.
5. C. S. Rao, “Environmental Pollution Control Engineering”, New Age International Ltd, 2001.

7. K. Joseph and R.Nagendram, “Essentials of environmental studies”, Pearson Education Pt Ltd, Delhi, 2007. Education Pt Ltd, Delhi, 2007.

ACTIVITIES:

- *Painting contests on environmental issues and themes.*
- *Models of energy resources, Pollution and Solid Waste Management-3R strategy.*
- *Quiz competition.*
- *Essay writing competition.*
- *Skit, JAM and debate.*
- *Field work and documentation.*
- *Assignments.*

16BT102 BIOPRODUCTS AND BIOENTREPRENEURSHIP

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
5	45	2	12	2	5

Course Description and Objectives:

The course offers knowledge on various bio-products and their marketing. The objective of the course is to create awareness on a wide array of biologically derived products. In addition, it also encourages students to explore entrepreneurship in the arena of bioproducts.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: gain insights on a wide range of bioproducts viz., biofuels, biomaterials, biochemicals of therapeutic and nutritional importance.

CO2: analyse and perceive green entrepreneurship and bioproduct market.

SKILLS:

✓ *Evaluate the scope for bioentrepreneurship.*

✓ *Recycle and reuse biowaste.*

✓ *Design small scale industry setup.*

✓ *Analyze bioproducts market trend.*

UNIT - 1 **L-9, T-3**

INTRODUCTION TO BIOPRODUCTS: Definition of bioproducts; Categories of bioproducts; Importance of bioproducts; Bioproducts industry - strategies and action plans, global trends and current situation; Bioproducts used for decoration; Biofertilisers; Examples of clonal propagation of plants; Socio-economic and environmental impact of bioproducts.

UNIT - 2 **L-9, T-3**

ENERGY RELATED BIOPRODUCTS: Liquid fuels - ethanol and biodiesel; Carbon neutrality; Conversion mechanisms; Solid biomass for combustion to generate heat and power; Gaseous fuel such as biogas; Renewable energy opportunities for Indian entrepreneurs.

UNIT - 3 **L-9, T-3**

BIOMATERIALS: Bioplastics from plant oils and sugars; Biofoams and biorubber from plant oils and latex; Biocomposites manufactured from agricultural (e.g., hemp, flax, kenaf) and forestry; Biofibres.

UNIT - 4 **L-9, T-3**

BIOCHEMICALS: Industrial - basic and specific chemicals, resins, lubricants and solvents; Pharmaceuticals - examples of monoclonal therapeutic antibodies, interleukins, enzymes (therapeutic and detergent), hormones and vaccines; Antibiotics; Omega 3 fatty acids; Biocosmetics - soaps, body creams and lotions; Biorepellents - case study; Trichoderma.

UNIT - 5 **L-9, T-3**

ENTREPRENEURSHIP RELATED TO BIOPRODUCTS: Entrepreneurship ecosystem and bioeconomy; Perception and analysis of green entrepreneurship ecosystem by its stakeholders; Green entrepreneurship - case studies; Bioproducts manufacturers and suppliers in India.

TEXT BOOKS :

1. N.T. Dunford, "Food and industrial bioproducts and bioprocessing", Wiley-Blackwell publishers, 2012.
2. J.C. Philp and K.C. Pavanan, "Perspectives- bio-based production in a bioeconomy", Asian Biotechnology and Development Review, Vol. 15, No.2, pp 81-88, 2012.

REFERENCE BOOKS :

1. J. W. Lee, "Advanced Biofuels and Bioproducts", Springer New York, 2013.
2. C. T. Hou and J.F. Shaw, "Biocatalysis and Bioenergy", Wiley publishers, 2008.

ACTIVITIES:

- *Models on renewable energy-biomass, biofuels, biogas.*
- *Prepare vermicompost.*
- *Case studies on green entrepreneurship.*

16BM101 FUNDAMENTALS OF ANATOMY AND PHYSIOLOGY

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	-	45

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

This course provides a comprehensive study of the anatomy and physiology of the human body. Topics include in this course are body organization; respiratory, skeletal, circular, urinary, nervous systems and special senses systems. To know basic structural and functional elements of human body, to learn about organs and structures involving in system formation and functions, to understand all systems in the human body.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Distinguish amongst different specialized tissues, bones and muscle types.

CO2: Describe various stages of bone formations and muscle's anatomy & physiology.

CO3: Interpret the fluids exchange & electrophysiology in cardiovascular and respiratory systems by using various physics laws.

CO4: Demonstrate urine formation & predict reproduction cycles based on ion exchanges in kidney and human reproductive system.

CO5: Illustrate the structural and functional aspects of nervous system and special senses using sketches and electrophysiology.

CO6: Categorize the physiological aspects on blood and organ systems using hospital grade equipment.

SKILLS:

- ✓ *location of body parts and identification.*
- ✓ *know the various tissues and their appearances.*
- ✓ *know the physics behind respiratory systems.*
- ✓ *circulatory system's working principle.*

UNIT I **L-8**

BASIC ELEMENTS OF HUMAN BODY: Cell, Structure and organelles, Functions of each component in the cell; Cell membrane, Transport across membrane, Origin of cell membrane potential, Action potential, Tissue - Types, Specialized tissues, Functions.

UNIT II **L-9**

MUSCULO-SKELETALSYSTEM: Skeletal system, Anatomy of bone, Bone types and functions; Joint - Types of Joints–Sinovial joints, Types of movements Cartilage and functions; Muscular system-Types of muscles and their locations, Structure of skeletal muscle, Physiology of muscle contraction, NMJ, Introduction to EMG, Types of muscles in limbs, Locations and their actions.

UNIT III **L-11**

CIRCULATORY SYSTEM: Blood composition, Functions of blood and components Blood groups, Importance of blood groups, Identification of blood groups; Structure of heart – Properties of Cardiac muscle, Conducting system of heart, Cardiac cycle, ECG, Heart sound, Volume and pressure changes and regulation of heart rate, circulatory system; Factors regulating Blood flow. Respiratory System- Components of respiratory system, Respiratory Mechanism, Types of respiration, Oxygen and carbon dioxide transport and acid base regulation, Respiratory volumes.

UNIT IV **L-8**

URINARY AND REPRODUCTIVE SYSTEM: Urinary System-Structure of Kidney and Nephron; Mechanism of Urine formation and acid base regulation, Urinary reflex, Homeostasis and blood pressure regulation by urinary system; Reproductive system-Parts of Male reproductive system, Spermatogenesis and hormonal regulation; Parts of female reproductive system, Oogenesis and hormonal regulation, Menstrual cycle.

UNIT V **L-8**

NERVOUS SYSTEM: Structure of a Neuron, Types of Neuron, Synapses and types, Conduction of action potential in neuron; Central nervous system – Anatomy of brain, Spinal cord, Regions of brain, Brain waves, Neurotransmitters, P.N.S- Spinal reflex, Reflex action, NMJ, A. N. S- Sympathetic and Parasympathetic systems, Special senses.

ACTIVITIES:

- o dissection of human body.dissect human body.
- o identify different organs human body.
- o measure lung capacitance using spirometer.
- o determine bp under various physical positions.
- o visit hospitals to see different physiological parameters and procedures.

LABORATORY EXPERIMENTS

Outcomes:

By the end of the laboratory experiments, students will be able to

- identify organs, in dead body dissections.
- look through the microscopes and identify different tissues.
- examine blood pressure.
- measure some important parameters.

List of Experiments: Total hours-45

1. Observe Histology-Slides of primary tissues of body.
2. Demonstration of Brain Dissection.
3. Dissected Upper limbs and Lower limbs -Its demonstration.
4. Dissection of Pelvis and Pelvic Organs Abdomen and Abdominal Organs.
5. Dissection of thorax – showing heart and major blood vessels, lungs and respiratory system.
5. Record the B.P. and effects of Physical exertion and posture on this parameter.
6. Recording of mechanical response of the muscle on application of induced electric signal.
7. Analyze load, length and force relationship of muscle.
8. Determine the rate of conduction of nerve impulse.
9. Spirometry-Record tidal volume, inspiratory reserve volume, Expiratory reserve volume, Vital capacity and index and effect of posture on vital capacity.
10. Isolated heart perfusion by Legendraff Technique (demonstration).

16BM201 BIOMECHANICS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

The course provides an overview of musculoskeletal anatomy, the mechanical properties and structural behavior of biological tissues, and biodynamics. Specific course topics include structure and function relationships in tissues and organs; application of stress and strain analysis to biological tissues; analysis of forces in human function and movement; energy and power in human activity. The course is meant to provide basic background in biomechanics for engineering students considering medical school, industrial positions in the biomedical field.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Apply mechanical forces to joints and derive the basic constitutive equations for solid and liquid bio elements.

CO2: Identify the properties of structures and functions to human joints for normal and diseased

CO3: Analyse static and dynamic gait postures for analysing kinematic data.

CO4: Select appropriate biomaterials for the manufacturing of implants.

CO5: Derive the equations of fluids for estimating pressures in a vessel.

CO6: Elaborate on forces acting on human joints.

SKILLS :

- ✓ *Analysis of laws of mechanics for bio mechanics.*
- ✓ *Determination of types of flows in vessels.*
- ✓ *Analyze physics behind tissues, bones, structures.*
- ✓ *Analysis of movement and other motion in humans.*

ACTIVITIES:

- *Application of navier's stoke's equations.*
- *Applications of hagen-poiseuille equations.*
- *Analysis of blood vessels based on various laws of structures.*
- *Medical implants processing and manufacturing.*
- *Analyze the movement of body using gait analysis.*

UNIT - 1 **L-9, T-3**

INTRODUCTION TO MECHANICS: Principles of Mechanics, Vector mechanics, Mechanics of motion - Newton's laws of motion, Kinetics, Kinematics of motion, Basic Fluid mechanics – Euler equations and Navier-Stoke's equations, Viscoelasticity, Constitutive equations, Stress transformations, Strain energy function.

UNIT - 2 **L-9, T-3**

BIOFLUID MECHANICS:Introduction, Viscosity and capillary viscometer, Rheological properties of blood, Laminar flow, Couette flow and Hagen-poiseuille equation, Turbulent flow. Cardiovascular system - Biological and mechanical valves development, Artificial heart valves testing of valves, Structure, functions, Material properties and Modeling of Blood vessels.

UNIT - 3 **L-9, T-3**

BIOSOLID MECHANICS: Hard Tissues- Bone structure and composition mechanical properties of bone, Cortical and cancellous bones, Viscoelastic properties, Maxwell and Voight models,Anisotropy; Soft Tissues- Structure, Functions, Material properties and Modeling of Soft Tissues- Cartilage, Tendon, Ligament, Muscle.

UNIT - 4 **L-9, T-3**

BIOMECHANICS OF JOINTS AND IMPLANTS: Skeletal joints, Forces and stresses in human joints, Analysis of rigid bodies in equilibrium, Free body diagrams, Types of joint, Biomechanical analysis of elbow, Shoulder, Spinal column, Hip knee and Ankle. Design of orthopedic implant, Specifications for a prosthetic joint, Biocompatibility, Requirement of a biomaterial, Characteristics of different types of biomaterials, Manufacturing process of implants, Fixation of implants.

UNIT - 5 **L-9, T-3**

MODELLING AND ERGONOMICS:Introduction to Finite Element Analysis, Analysis of bio mechanical systems using Finite element methods, Graphical design; Ergonomics- Gait analysis, Design of work station, Sports biomechanics, Injury mechanics.

TEXT BOOKS:

1. Y.C. Fung, "Bio-Mechanics- Mechanical Properties of Tissues", Springer-Verlag, 1998.
2. Duane Knudson, "Fundamentals of Biomechanics", 2^{nd}edition Springer Science and Business Media, 2007.
3. Marcelo Epstein, "The Elements of Continuum Biomechanics", ISBN: 978-1-119-99923-2, 2012.

REFERENCE BOOKS:

1. Jay D. Humphrey and Sherry De Lange, "An Introduction to Biomechanics: Solids and Fluids, Analysis and Design", Springer Science and Business Media, 2004.

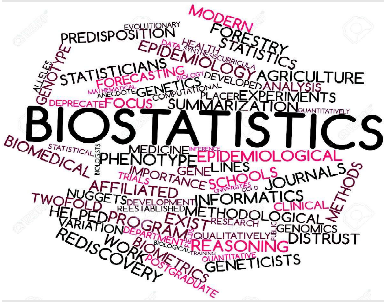
16BM202 BIOSTATISTICS



Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

This course is an introduction to statistical methods used in health, biological and medical sciences. The main aim of the course is to impart the knowledge about descriptive statistics and performance characteristics of diagnostic tests, to make student know about graphical methods, estimation, hypothesis testing, p-values, correlation and linear regression.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Apply Handerson- Hasselbalch equation for finding out Ph of buffers; apply principles of viscosity and other mechanisms to living organisms

CO2: Analyze the physical properties of carbohydrates and metabolic pathways

CO3: Categorize lipids and the metabolic pathways

CO4: Evaluate the structural organization and separation of proteins

CO5: Illustrate the enzyme action and their concentrations.

CO6: Examine the human body biochemistry with chemical analyzers.

SKILLS :

- ✓ *Organization of assorted data into meaningful information using statistical methods.*
- ✓ *Develop analytical capability to visualize data and give the pattern for data.*
- ✓ *Determination of various statistical procedures.*
- ✓ *Curve fittings.*

ACTIVITIES:

- *Solve regression models and analysis.*
- *Determination of probability. And distribution.*
- *Assessment of severity state of a patient with prognosis of outcome of a disease.*
- *Hypothesis testing for various populations.*

UNIT - 1 **L-9, T-3**

CONCEPTS OF BIOSTATISTICS: Basic statistical measures, measures of central tendency, measures of dispersion, variance, standard deviation, properties of probability, probability distributions, sampling distributions.

UNIT - 2 **L-9, T-3**

ESTIMATION AND HYPOTHESIS TESTING: Confidence intervals for data, t distribution, determination of sample size for estimating means and proportions; Hypothesis testing for a single population mean/proportion difference between two population means/proportions, sample size to control type I and type II errors.

UNIT - 3 **L-9, T-3**

ANALYSIS OF VARIANCE: The completely randomized design, random sized complete block design, repeated measures design.

UNIT - 4 **L-9, T-3**

REGRESSION AND CORRELATION: Simple linear regression model, regression equation, the correlation model, multiple linear regression model, multiple regression equation, multiple correlation model, additional techniques of regression analysis.

UNIT - 5 **L-9, T-3**

CHI-SQUARE DISTRIBUTION: tests of good fit, independence, homogeneity, non-parametric statistical procedures, regression analysis.

TEXT BOOKS:

1. Stanton A. Glantz, “Primer of biostatistics”, Mc Graw Hill , 2nd edition.
2. Wayne S. Daniel, “Biostatistics: A foundation for analysis in the health sciences”, John Wiley and sons 6th edition.

16BT101 BIOCHEMISTRY

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	5

Course Description and Objectives:

This course surveys the structure and function of biological molecules, including carbohydrates, lipids, and proteins. Topics of this course include enzyme activity, special properties of biological membranes, hormones, vitamins, metabolic pathways, biotransformation and molecular biology, Introduction to Biochemistry.Familiarized with the Classification, structure and properties of carbohydrates, Lipids, Protein and Enzyme.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: explain the fundamentals of biochemistry.

CO2: identify the DNA and RNA structures.

CO3: know the all carbohydrates and their properties.

CO4: know the classifications, functions and properties of proteins.

CO5: understand the kinetics of enzymes and factors affecting enzymatic activity.

SKILLS :

- ✓ *Functioning and understanding of various body fluids.*
- ✓ *Interpretation of harnessing of energy in organ system.*
- ✓ *Replications, DNA synthesis.*
- ✓ *Explain the basis for enzyme kinetics.*

ACTIVITIES:

- *Study of amount of creatine.*
- *Estimation of urea, glucose.*
- *Study Ph of different solutions.*
- *Chromatography of amino acids.*

UNIT - 1 **L-9**

INTRODUCTION TO BIOCHEMISTRY: Water as a biological solvent, Weak acid and bases, PH, buffers, Handerson-Hasselbalch equation, Physiological buffers, Fitness of the aqueous environment for living organism; Principle of viscosity, Surface tension, Adsorption, Diffusion, Osmosis and their applications in biological systems.

UNIT - 2 **L-9**

CARBOHYDRATES: Classification of carbohydrates - Mono, Di, Oligo and polysaccharides. Isomerism, racemization and mutarotation .Structure, physical and chemical properties of carbohydrates; Metabolic pathways and bioenergetics – Glycol sis, glycogen sis, Glycogenolysis and its hormonal regulation; TCA cycle and electron transport chain; Oxidative phosphorylation.

UNIT - 3 **L-9**

LIPIDS: Classification of lipids- Simple, Compound and derived lipids; Nomenclature of fatty acid, Physical and Chemical properties of fat; Saponification number, Reichert- Meissl number and iodine number; Metabolic pathways-Synthesis and degradation of fatty acid (beta oxidation), Hormonal regulation of fatty acid metabolism, Ketogenesis, Structural architecture and Significance of biological membrane.

UNIT - 4 **L-9**

NUCLEIC ACID AND PROTEIN: Structure of purines and pyrimidines, Nucleoside, Nucleotide, DNA act as a genetic material, Chargaff's rule; Watson and crick model of DNA; Structure of RNA and its type, Classification, Structure and properties of proteins, Structural organization of proteins, Classification and properties of amino acids, Separation of protein, Gel filtration, Electrophoresis and Ultracentrifugation.

UNIT - 5 **L-10**

ENZYME AND ITS KINETICS: Classification of enzymes, Apoenzyme, Coenzyme, Holoenzyme and cofactors; Kinetics of enzymes - Michaelis-Menten equation; Factors affecting enzymatic activity- Temperature, PH, Substrate concentration and Enzyme concentration, Inhibitors of enzyme action, Competitive, Non- competitive, Irreversible; Enzyme- Mode of action, Allosteric and covalent regulation, Clinical significance of enzymes, Measurement of enzyme activity and interpretation of units.

LABORATORY EXPERIMENTS

The student will be able to:

- measure the PH level of various solutions.
- quantitative estimation of glucose and other molecules.
- cerebrospinal fluid anlysis.

LIST OF EXPERIMENTS: Total hours-30

1. Study of Plasma protein electrophoresis.
2. Study of Chromatography of amino acids.
3. Study of Colorimetry.
4. Study of Spectrophotometry.
5. Study of pH meter.
6. Study of Flame photometry-Analysis of Na and K in an unknown sample.

7. Quantitative estimation of glucose.
8. Quantitative estimation of Urea.
9. Quantitative estimation of Creatinine.
10. Quantitative estimation of Serum proteins, A/G Ratio.
11. CSF Analysis.
12. Clearance Tests-Demonstration.

16BM203 ELECTRONICS ENGINEERING-I

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	46	6	12	3	2

Course Description and Objectives:

This course is aimed at offering fundamental concepts of semiconductor devices and circuits. It starts with the physics concepts that form the basis for semiconductor material formation. Then it introduces the Junction Diode, Transistor, FET and other basic devices that are designed with semiconductor materials. It also includes the concepts of simple circuits that are designed with the help of these basic devices. As a first-level course in electronics, it forms the basis to understand advanced electronic courses that will be studied in subsequent semesters.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Understand the working of semiconductor devices with the help of V-I characteristics.

CO2: Design half wave and full wave rectifiers and Zener diode as voltage regulator.

CO3: Investigate the characteristics of Amplifier Circuits employing BJT and FET devices.

CO4: Compare CB, CE, CC configurations of BJT and CG, CD, CS configurations of FET.

CO5: Analyze the different multistage amplifiers and demonstrate negative feedback amplifier circuits and positive feedback oscillators.

CO6: Apply the concepts of basic electronic devices to design various circuits.

SKILLS:

- ✓ *Identify a Semiconductor Diode for a specific application and power handling capacity.*
- ✓ *Identify the transistor type for a given application (switch/amplifier).*
- ✓ *Recognize the require specifications of the transistor.*
- ✓ *Identify the amplification factor required.*
- ✓ *Test the working condition of the transistor.*

UNIT - 1 L-9

PN JUNCTION DEVICES:PN junction diode, Structure, Operation and V-I characteristics, Diffusion and transient capacitance, Rectifiers, Half Wave and Full Wave Rectifier, Display devices, LED, Laser diodes, Zenar diode characteristics, Zenar Reverse characteristics, Zenar as regulator.

UNIT - 2 L-9

TRANSISTORS:BJT, JFET, MOSFET, Structure, Operation, Characteristics and Biasing UJT, Thyristor and IGBT, Structure and characteristics.

UNIT - 3 L-9

AMPLIFIER:BJT small signal model, Analysis of CE, CB, CC amplifiers, Gain and frequency response, MOSFET small signal model, Analysis of CS and Source follower, Gain and frequency response High frequency analysis.

UNIT - 4 L-9

MULTISTAGE AMPLIFIERS AND DIFFERENTIAL AMPLIFIER:BIMOS cascade amplifier, Differential amplifier, Common mode and Difference mode analysis, FET input stages, Single tuned amplifiers, Gain and frequency response, Neutralization methods, Power amplifiers,Types (Qualitative analysis).

UNIT - 5 L-9

FEEDBACK AMPLIFIERS AND OSCILLATORS:Advantages of negative feedback, Voltage, Current, Series, Shunt feedback, Positive feedback, Condition for oscillations, Phase shift – Wien bridge, Hartley, Colpitts and Crystal oscillators.

LABORATOTY EXPERIMENTS

Outcomes:

students will be able to :

- assemble simple circuits to get basic circuits.
- understand the V-I characteristics of P-N junction diode and hence determine the diodeforward, reverse currents, static and dynamic resistances.
- analyze the V-I characteristics of zener diode under reverse biased condition and observethe application as voltage regulator.
- calculate the efficiency and ripple factor of all rectifiers and analyze their performance withand without filter.
- understand the input and o/p characteristics of all BJT configurations in active region anddetermine its current amplification factors.
- understand the drain and transfer characteristics of FET and determine its amplificationfactor.
- understand the diode application as a clipper.

LIST OF EXPERIMENTS Total hours-30

1. Characteristics of PN Junction Diode.
2. Zener diode Characteristics & Regulator using Zener diode.

ACTIVITIES:

- *Choose a diode for a Cell-phone/ Laptop/ Tablet adapter/ for various rating.*
- *Zenar diode as a current regulator.*
- *Design three types of biasing circuits and determine the stability factors in each case.*
- *Transistor as an amplifier for the given specifications.*
- *Design a wideband amplifier with FET.*

3. Common Emitter input-output Characteristics.
4. Common Base input-output Characteristics.
5. FET Characteristics.
6. Common Emitter/Common source amplifier.
7. Cascade Amplifier.
8. Wien Bridge Oscillator using Transistors.
9. Class A Power Amplifier (Transformer less).
10. Class B Complementary Symmetry Amplifier.
11. Single Tuned Voltage Amplifier.
12. High Frequency Common base (BJT) / Common gate(JFET) Amplifier.

16EC203 NETWORK THEORY

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	46	6	12	3	5

Course Description and Objectives:

This course enables the students to learn advanced concepts in circuit analysis which are applicable in solving electronic circuits. The aim of this course to introduce the student to the derivation of transient responses of RC, RL and RLC circuits, steady state response of circuits to sinusoidal excitation in time domain, application of phasors to circuit analysis and introduction to graph theory to analyze circuits.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Apply KVL, KCL, source transformation, star-delta transformation, voltage and current division rules on Electrical networks.

CO2: Apply the concepts of various network theorems and applying to the linear circuits.

CO3: Analyze the transient response of RL, RC and RLC circuits for DC.

CO4: Investigate Series and Parallel resonant circuits

CO5: Analyze the two port network parameters and their Interconnections.

CO6: Examine the branch currents and voltages using Tie set and cutest Matrices

SKILLS:

- ✓ *Determine currents and voltages of all elements of any electrical system network.*
- ✓ *Analysis of simple house wiring diagram.*
- ✓ *Analysis of simple circuits by using theorems.*
- ✓ *Calculate power, current and voltage in any AC and DC circuits.*
- ✓ *Design of suitable Battery for small applications.*
- ✓ *Application of two- port network parameters to analyze transmission lines and filters.*

ACTIVITIES:

- *Measure the Resistance of any resistive Electrical Appliance like water heater, incandescent bulb.*
- *Design of small size house wiring system.*
- *Design circuits with suitable load to get maximum power from source.*
- *Determination of RLC values for given resonant frequency connected series/parallel combination.*
- *Design resonant circuit for oscillator and filter applications.*
- *Design of Power bank for mobile charger circuit.*
- *Determination of Voltage and current characteristics of given Black box.*
- *Verify duality for a given Network.*

UNIT - 1 **L-9, T-3**

INTRODUCTION OF CIRCUIT ELEMENTS: Ideal, Practical and dependent sources and their V-I characteristics, Source transformation, Voltage and current division, V-I characteristics of passive elements and their series / parallel combination, Energy stored in Inductors and capacitors, Kirchhoff's voltage law and Kirchhoff's current law, Mesh and nodal analysis, Star and delta conversions.

UNIT - 2 **L-9, T-3**

SINUSOIDAL STEADY STATE ANALYSIS AND RESONANCE: Instantaneous, Peak, Average ,RMS values, Crest factor and form factor of periodic waveforms, Notation and concept of phasors, Response of R, L, C series and parallel combination circuits to sinusoidal excitation, Calculation of active and reactive powers, Resonance - Series and parallel resonance circuits, concept of bandwidth and Q factor.

UNIT - 3 **L-9, T-3**

NETWORK TRANSIENT ANALYSIS: Transient response of R-L, R-C, R-L-C circuits (Series and parallel combinations) for D.C and sinusoidal excitations, Initial conditions, Time domain and laplace transform methods of solutions.

UNIT - 4 **L-9, T-3**

NETWORK THEOREMS: Superposition theorem, Thevenin's and Norton's theorems, Reciprocity, Compensation, Maximum power transfer theorems, Millman theorem, Application of theorems to DC and AC circuits.

UNIT - 5 **L-9, T-3**

TWO PORT NETWORK PARAMETERS: Introduction to Two port networks, Open circuit impedance and short circuit admittance (Y), Transmission and inverse transmission, Hybrid and inverse hybrid parameters, Relation between parameter sets, Interconnection of two port networks, Graph theory - Definitions, Graph, Tree, Basic tie-set and basic cut set matrices for planar networks, Loop and nodal methods of analysis of networks with independent and dependent voltage and current sources, Duality and dual networks.

16BM204 SIGNALS AND SYSTEMS FOR BIOENGINEERS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

This course explains the basic properties of signal and systems and the various methods of classification and Laplace Transform and Fourier transform and their properties. It is useful to know Z transform and DTFT and their properties to characterize LTI systems in the Time domain and various Transform domains

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Describe basic signals and systems representation

CO2: Analyze continuous time signals by using appropriate mathematical tools like Fourier Transform and Laplace Transform.

CO3: Determine the response of a LTI continuous and discrete system to any arbitrary inputs and learn about signal transmission through linear systems.

CO4: Apply the concepts of convolution and correlation for continuous time signals.

CO5: Apply the sampling theorem to test a signal is over or under sampled.

CO6: Test the concepts of signals and systems using matlab.

SKILLS:

- ✓ *Test and design a stable system*
- ✓ *To Know real-world problems involving bio signals such as EEG, ECG and EMG*
- ✓ *Understand the abnormalities present in the physiological systems*
- ✓ *Learn and understand the various transforms and their applications in the analysis of signals and systems*
- ✓ *Use programming skills to visualize theoretical results*

ACTIVITIES:

- *Recording of various signals like Speech.*
- *Noise, Audio signals*
- *Analysis using Matlab and spectrum analyzer.*
- *Determine the quality of signals and improvement of them.*

UNIT - 1 **L-9**

CLASSIFICATION OF SIGNALS AND SYSTEMS: Continuous time signals (CT signals), Discrete time signals (DT signals), Step, Ramp, Pulse, Impulse, Sinusoidal, Exponential, Classification of CT and DT signals, Periodic and A periodic signals, Deterministic and Random signals, Energy and Power signals, CT systems and DT systems Classification of systems, Static and Dynamic, Linear and Nonlinear, Time-variant and Time-invariant, Causal and Noncausal, Stable and Unstable.

UNIT - 2 **L-9**

ANALYSIS OF CONTINUOUS TIME SIGNALS: Fourier series analysis-spectrum of Continuous Time (CT) signals, Fourier and Laplace Transforms in CT Signal Analysis, Properties.

UNIT - 3 **L-9**

LINEAR TIME INVARIANT- CONTINUOUS TIME SYSTEMS: Differential Equation, Block diagram representation, Impulse response, Convolution Integrals, Fourier and Laplace transforms in Analysis of CT systems.

UNIT - 4 **L-9**

ANALYSIS OF DISCRETE TIME SIGNALS: Baseband Sampling, DTFT, Properties of DTFT, Z Transform, Properties of Z Transform.

UNIT - 5 **L-9**

LINEAR TIME INVARIANT-DISCRETE TIME SYSTEMS: Difference Equations, Block Diagram Representation, Impulse response, Convolution sum, Discrete Fourier and Z Transform Analysis of Recursive and Non-Recursive systems.

LABORATORY EXPERIMENTS

Outcomes:

Upon completion of the lab:

- explain the importance of superposition in the analysis of linear systems.
- list and apply properties of different transforms.
- use Fourier and Laplace transforms to solve differential equations, and to determine the response of linear systems to known inputs.
- understand the relationship between the stability and causality of systems and the regionof convergence of their Laplace transforms.
- demonstrate the relation among the transfer function, convolution, and the impulse response.
- understand the fundamentals of sampling including the implications of the sampling theorem.

LIST OF EXPERIMENTS: **Total hours-30**

1. Introduction to MATLAB.
2. Vectors and Matrices generation and operations on it.
3. Generation and plotting of Trigonometric and exponential functions.
4. Standard Signal Generation (Impulse,Step, Ramp & Sinc).
5. Operations on signals (Folding, Shifting and Scaling).
6. Periodic and Non-periodic signal generation.
7. Analysis of periodic signals.
8. Analysis of Non-periodic signals.
9. Analysis of transfer function.
10. System Analysis by using poles and zeroes.
11. Sampling theorem verification.
12. System Response.
13. Convolution of Continuous signals.
14. Correlation of Continuous signals.

Note: Any twelve of the above experiments.

16EL102 SOFT SKILLS LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The Soft Skills Laboratory course is aimed at training undergraduate students on employability skills. Designed to impart work related skills, the course will enable trainees to develop interpersonal communication, leadership, preparing resumé, group discussion and interview skills. It will give them the required competence and confidence to handle professional tasks.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: think critically on issues for informed decision making and know how to communicate effectively through choice of appropriate language and speech, while dealing with others at the workplace.

CO2: identify and introspect on individual strengths and weaknesses.

CO3: improve levels of self-awareness and self-worth for greater efficacy at workplace.

SKILLS:

- ✓ *Communicate and understand the difference between soft skills and hard skills.*
- ✓ *Professionalism and employability skills.*
- ✓ *Plan career by drawing their SWOT, setting the goal, learn the importance of time and stress management.*
- ✓ *Vocabulary, situational english, group discussion, reading comprehension and listening comprehension which are essential for all competitive examinations.*
- ✓ *Prepare resumé and learn how to face interview.*
- ✓ *Gender sensitive language, good manners, emotional intelligence and essential skills.*

UNIT - 1 **P-8**

A) COMMUNICATION: Need for effective communication - The process of communication, Levels of communication, Flow of communication, Choice of diction and style with reference to setting (formal, semi-formal or informal); Communication networks, Barriers to communication, Miscommunication, Noise and ways to overcome the barriers.

B) SOFT SKILLS: Difference between soft and hard skills, Need for soft skills, Professionalism, Employability skills.

C) CAREER PLANNING: Job vs career, Goal setting, SWOT analysis, Planning and prioritization, Four quadrant time management system, Self-management, Stress-management.

ACTIVITY: Johari Window for SWOT analysis, Setting a SMART goal using the provided grid, Writing a statement of purpose (SOP).

UNIT - 2 **P-8**

A) VOCABULARY BUILDING: Word etymology, Roots, Prefixes and suffixes, Synonyms and antonyms, Collocations, One-word substitutes, Analogies, Idioms and phrases, Contextual guessing of unfamiliar words, Task-oriented learning (50 words).

ACTIVITY: Making a flash card (one per day by each student), Vocabulary exercises with hand-outs, Vocabulary quiz (evaluation will be a combination of the 50 words provided by the instructor and the flash cards made by the student (one per day).

B) FUNCTIONAL ENGLISH: Situational dialogues, Role plays (including small talk), Self introduction, Opening and closing a telephonic conversation, Making an appointment, Making a query, Offering/ Passing on information, Communicating with superiors, Expressing agreement/objection, Opening bank account (combination of prepared and impromptu situations given to each student).

C) GROUP DISCUSSION: Articulation and flow of oral presentation, Dynamics of group discussion, Intervention,Summarizing and conclusion, Voice modulation, Content generation, Key word approach (KWA), Social, Political, Economic, Legal and technical approach (SPELT), View point of affected part (VAP), Language relevance, Fluency and coherence.

ACTIVITY: Viewing a recorded video of GD and Mock sessions on different types of GD topics - Controversial, Knowledge, Case study (including topics on current affairs).

UNIT - 3 **P-4**

A) RESUME-WRITING: Structure and presentation, Defining career objective, Projecting one's strengths and skill-sets, Summarizing, Formats and styles and covering letter.

ACTIVITY: Appraising some samples of good and bad resumes, Preparing the resume, Writing an effective covering letter.

B) FACING INTERVIEWS: Interview process, Understanding employer expectations, Pre-interview planning, Opening strategies, Impressive self-introduction, Answering strategies, Other critical aspects such as body language, Grooming, Other types of interviews such as stress-based interviews, Tele-interviews, Video interviews, Frequently asked questions (FAQs) including behavioural and HR questions and the aspect looked at by corporate during interviews.

ACTIVITY: Writing responses and practicing through role plays and mock interviews on the FAQs including feedback.

ACTIVITIES:

- *Formal and informal communication.*
- *SWOT analysis.*
- *Stephen covey Time Management matrix.*
- *Stress Management techniques.*
- *Vocabulary flash cards.*
- *Situational Dialogues.*
- *Group Discussion.*
- *Resume preparation.*
- *Mock Interview.*
- *Reading comprehension activities.*
- *Listening comprehension Activity by watching the American accent video.*
- *Emotional intelligence, etiquette quiz.*

UNIT - 4 **P-4**

A) READING COMPREHENSION: Reading as a skill, Techniques for speed reading, Understanding the tone, Skimming and scanning, Appreciating stylistics, Impediments for speed reading, Eye fixation, Sub-vocalization, Critical reading, Reading based on purpose, Reading for information, Reading for inference.

ACTIVITY: Reading comprehension exercises with texts drawn from diverse subject areas (Hand-outs), Newspaper activity with students divided into 4 groups, Each group looks at critical component of communication such as Listening, Speaking, Reading and writing enabling them to be better communicators as well as be more aware about the current affairs, Which help in group discussion.

B) LISTENING COMPREHENSION: Listening as a skill, Different types of listening, Active and passive listening, Top-down approach, Bottom-up approach, Understanding the non verbal cues of communication, Intonation and stress.

ACTIVITY: Narration of a story, Speech excerpts with different accents (Indian, British, American), listening comprehension exercises with audio and video excerpts.

UNIT - 5 **P-6**

IMPACT OF LANGUAGE ON PERSONALITY: Gender sensitive language in MNCs, Cultural sensitivity, Social awareness, Emotional intelligence, Good manners, Self-grooming, Positive body language, Accepting and handling responsibility, Assertiveness, Problem solving, Negotiating skills, Networking and creating a good first impression, Seven essential skills for a team player, Attentive listening, Intelligent questioning, Gently persuading, Respecting other’s views, Assisting others, Sharing, Participating actively.

ACTIVITY: Johari Window, Games and case studies.

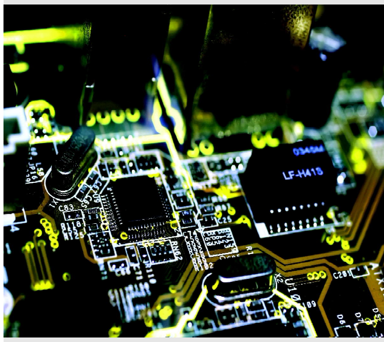
16BM205 ELECTRONICS ENGINEERING - II



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

This course introduces the theoretical and circuit aspects of op-amp, timer, which are the backbone for the basics of linear integrated circuits and to understand the various linear and non-linear applications of op-amp deals with fundamentals of number systems, Boolean expressions which are used to realize combinational and sequential circuits with their logic families. Its objective is to introduce the concepts and techniques associated with the number systems and codes, to minimize the logical expressions using Boolean postulates, to design various combinational and sequential circuits and to provide with a sufficient number of applications for the techniques and mathematics used in this course.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Understand number systems and its conversion; simplify Boolean expressions by different methods and implementation using logic gates.

CO2: Apply the Boolean algebra knowledge of mathematics to analyze combinational and sequential digital electronic circuits using K-map.

CO3: Understand the characteristics and specifications of operational amplifiers.

CO4: Analyze operational amplifiers based circuits used for various applications.

CO5: Analyze the operation of timer, phase locked loop and voltage controlled oscillators and its applications.

CO6: Evaluate the digital circuits and some common electronic circuits using linear ICs and its applications.

SKILLS:

- ✓ *Making conversions between numbers of different radices.*
- ✓ *Identifying the different gates and their properties.*
- ✓ *Minimize Boolean expression.*
- ✓ *Constructing different combinational circuits.*
- ✓ *Constructing different sequential circuits.*
- ✓ *Verify the functionality of digital circuits.*
- ✓ *Designing memories.*

ACTIVITIES:

- *Design digital circuits using universal gates.*
- *Design Combinational circuits like adder encoder, decoder.*
- *Design Sequential circuits like flip flops, counter.*

UNIT - 1 **L-9**

NUMBER SYSTEMS AND LOGIC GATES: **NUMBER SYSTEMS AND LOGIC GATES**: Decimal, Binary, Octal and Hexadecimal Numbers, Conversion between these number systems, Complements r's and (r-1)'s complements.- subtraction using complements – Encoding numbers and characters using Binary digits,Binary coded Decimal, Gray code, Binary to Gray code conversion, ASCII Code, Logic gates, Truth tables, NOT, AND, OR, NOR, NAND, XOR, XNOR, Boolean Laws and theorems, Solving Boolean expressions, Truth Tables and Logic circuits, The Karnaugh Map, Half adder, Full adder, Multiplexers and DE multiplexers, Decoders and encoders, Coding of Combination Circuits in verilog.

UNIT - 2 **L-9**

REGISTERS AND COUNTERS: **REGISTERS AND COUNTERS**: Flip Flops – RS, D, T, JK Flip Flops, Characteristic equations, exciting tables, JK Master, Slave flip-flop, Universal shift register, Design of modulo, N counters,Counter design using state diagram,Sequential circuit design with verilog.

UNIT - 3 **L-10**

OPERATIONAL AMPLIFIERS: **OPERATIONAL AMPLIFIERS**: The characteristics of Ideal Operation,Slew rate, Offset voltage, Bias current, CMRR, bandwidth,Equivalent circuit of an op-Amp,Virtual ground concept, Linear applications of op-amp,Inverting and noninverting amplifier, Summing, Subtracting, Averaging amplifier,Voltage to current converter,Current to voltage converter, Differential amplifiers,Differentiator and integrator, Nonlinear applications, Comparator, Schmitt Triggers, Precision Diode Half wave and full wave rectifiers, Average detectors, Peak detector.

UNIT - 4 **L-9**

ACTIVE FILTERS AND SIGNAL GENERATOR: **ACTIVE FILTERS AND SIGNAL GENERATOR**: Active filters (first and second order), Low pass, High pass, Band pass filters, Band reject filters (notch filters), Oscillators, RC Phase shift and Wein-bridge, Waveform generators, Square, Triangular and saw tooth.

UNIT - 5 **L-9**

TIMER, PLL, A/D AND D/A CONVERTERS: **TIMER, PLL, A/D AND D/A CONVERTERS**:555 Timer (internal diagram) and its applications, Monostable Multivibrator, Astable Multivibrator; Phase locked Loop (565 - block diagram approach) and its applications, Frequency multiplication, Frequency translation, Voltage to frequency and frequency to voltage converters; DAC, Binary weighted DAC and R-2R DAC; ADC, single slope and dual slope ADCs, Successive approximation ADC.

LABORATORY EXPERIMENTS

Course outcomes:

The student will be able to:

- design Circuits using logic gates
- build Circuits for different application using opamp
- differentiate between oscillator and wave form generator
- convert Signals from Analog to Digital Vice versa

LIST OF EXPERIMENTS: TOTAL HOURS-30

1. Study of logic gates, Half adder and Full adder.
2. Encoder and BCD to 7 segment decoder.
3. Multiplexer and demultiplexer using digital ICs.
4. Universal shift register using flip flops.
5. Design of mod-N counter.
6. Inverting, non-inverting amplifier and comparator.
7. Integrator and Differentiator.
8. Active filter – first order and second order LPF and HPF.
9. Current to Voltage convertor and Voltage to Current Convertor.
10. Comparator, Peak detector and Average detector.
11. Instrumentation amplifier using IC741 49.
12. Wein bridge oscillator 13. Multivibrator using IC555 Timer.
14. Timer.
15. Phase Lock Loop.
16. A/D and D/A converter.

16BM206 BIOMATERIALS AND ARTIFICIAL ORGANS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	46	6	12	3	2

Course Description and Objectives:

This course aims at imparting the knowledge of material science, chemistry and characteristics and classification of Biomaterials. It is useful to learn about different metals and ceramics used as biomaterials, polymeric materials and combinations for mechanism of tissue replacement implants and also gives knowledge of the artificial organ development.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: analyze structural and functional aspects of living organisms.

CO2: explain the function of microscope.

CO3: discuss the importance of public health.

CO4: describe methods involved in treating the pathological diseases.

SKILLS:

- ✓ *Identify a Semiconductor Diode for a specific application and power handling capacity.*
- ✓ *understand the importance of importance of biomaterials and implants in the health care.*
- ✓ *study various materials for biocompatibility.*
- ✓ *determinE and selection of right materials for its bio applications.*
- ✓ *apply specific design and quality control.*

UNIT - 1 **L-9, T-3**

STRUCTURE OF BIO-MATERIALS AND BIO-COMPATIBILITY: Definition and classification of bio-materials, Mechanical properties, Visco elasticity, Wound healing process, Body response to implants, Blood compatibility.

UNIT - 2 **L-9, T-3**

IMPLANT MATERIALS :**IMPLANT MATERIALS**: Metallic implant materials, Stainless steels, Co-based alloys, Ti-based alloys, Ceramic implant materials, Aluminum oxides, Hydroxyapatite, Glass ceramics, Carbons, Medical applications.

UNIT - 3 **L-9, T-3**

POLYMERIC IMPLANT MATERIALS :Polymerization, Polyamides, Acryrilic polymers, rubbers, High strength Thermoplastics, Medical applications, Bio polymers- Collagen and Elastin; Medical Textiles-Silica, Chitosan, PLA composites, Sutures, Wound dressings; Materials for ophthalmology-Contact lens, Intraocular lens, Membranes for plasma separation and Blood oxygenation.

UNIT - 4 **L-9, T-3**

TISSUE REPLACEMENT IMPLANTS: Small intestinal submucosa and other decellarized matrix biomaterials for tissue repair; Softtissue replacements, Sutures, surgical tapes, adhesive, Percutaneous and skin implants, Maxillofacial augmentation, Vascular grafts, hard tissue replacement Implants, Joint replacements, Pancreas replacement.

UNIT - 5 **L-9, T-3**

ARTIFICIAL ORGANS: Artificial blood, Artificial skin, Artificial Heart, Prosthetic Cardiac Valves, Artificial lung (oxygenator), Artificial Kidney (Dialyser membrane), Dental Implants.

TEXT BOOK:

1. Sujata V. Bhatt, “Biomaterials”, Second Edition, Narosa Publishing House, 2005.

REFERENCE BOOKS:

6. B D Ratner, AS Hoffmann,FJ Schoen and JE Lemmons, “An introduction to Materials in Medicine”, Academic Press 1996.

ACTIVITIES:

- *Classify biomaterials.*
- *Characterize the polymers based on strength, yielding and other mechanical properties specific to application.*
- *Biomaterials used for medical grafts,*
- *Determine and select the right materials for surgeries, or implants or whole organs replacement with artificial organs.*

16BM207 PATHOLOGY AND MICROBIOLOGY

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	46	6	12	3	2

Course Description and Objectives:

This course deals with the principles and mechanism of pathological processes,cell injury, reversible and persistent cell injury reactions,Necrosis and apoptosis. It also explains about Acute, chronic and granulomatous inflammations, Systemic manifestations of inflammation. The course aims at learning role of pathogenic bacteria and viruses in causing disease laboratory diagnosis, methods of prevention and treatment, gaining knowledge of the structural and functional aspects of living organisms and also useful to know the etiology and remedy in treating the pathological diseases.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: describe the purpose and methods of measurements.

CO2: explain different display and recording devices for various applications.

CO3: know the different display and recording devices.

CO4: use different biosensors in various applications to acquire the information.

SKILLS:

- ✓ *Classification of cells and functions.*
- ✓ *Repair mechanisms of cells, tissues.*
- ✓ *Blood and bodily fluids regulations and disorders.*
- ✓ *Pathogens and other bacterial identifications.*
- ✓ *Study of immune response and various antigens.*

UNIT - 1 **L-9**

CELL DEGENERATION, REPAIR AND NEOPLASIA: Cell injury and Necrosis, Apoptosis, Intracellular accumulations, Pathological calcification, Cellular adaptations of growth and differentiation, Inflammation and Repair including fracture healing, Neoplasia, Classification, Benign and Malignant tumors, Carcinogenesis, Spread of tumors, Autopsy and biopsy.

UNIT - 2 **L-9**

FLUID AND HEMODYNAMIC DERRANGEMENTS: Edema, Normal hemostasis, Thrombosis, Disseminated intravascular coagulation, Embolism, Infarction, Shock, Hematological Disorders-Bleeding disorders, Leukaemias, Lymphomas.

UNIT - 3 **L-9**

MICROSCOPES: Light microscope,Bright field, Dark field, Phase contrast, Fluorescence, Electron microscope (TEM & SEM); Preparation of samples for electron microscope, Staining methods – Simple, Gram staining and AFB staining.

UNIT - 4 **L-9**

MICROBIAL CULTURES: Morphological features and structural organization of bacteria, Growth curve, Identification of bacteria, Culture media and its types, Culture techniques and Observation of culture.

UNIT - 5 **L-9**

IMMUNOLOGY: Natural and artificial immunity, Opsonization, Phagocytosis, Inflammation, Immune deficiency syndrome, Antibodies and its types, Antigen and antibody reactions, Immunological techniques-Immune diffusion, Immuno electrophoresis, RIA and ELISA, Monoclonal antibodies, Disease caused by bacteria, Fungi, Protozoal, Virus and Helminthes.

LABORATORY EXPERIMENTS

Course outcomes:

Student will be able to :

- study the histological slides
- observe stains under the microscopes.
- calculate clotting and bleeding times.

LIST OF EXPERIMENTS: Total hours-30

1. Urine physical and chemical examination (protein, reducing substances, ketones, bilirubin and blood)
2. Study of parts of compound microscope
3. Histopathological slides of benign and malignant tumours.
4. Manual paraffin tissue processing and section cutting (demonstration)
5. Cryo processing of tissue and cryosectioning (demonstration)
6. Basic staining – Hematoxylin and eosin staining.

ACTIVITIES:

- *Identification of bacteria and colonies with staining.*
- *Observing cells under micro-scopes and identifying.*
- *Culturing cells to colonies to identify bacteria.*
- *Finding anti bodies and antigens using ELISA and RIA tests and more.*

7. Special stains – cresyl fast Blue (CFV)- Trichrome – oil red O – PAS
8. Simple stain.
9. Gram stain.
10. AFB stain.
11. Slides of malarial parasites, micro filaria and leishmania donovani.
12. Haematology slides of anemia and leukemia. Study of bone marrow charts.
13. Bleeding time and clotting time.

16BM208 TRANSDUCERS AND BIOSENSORS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

This Course imports the knowledge of Classification and descriptions of transducers, Survey of possible energy conversions. this course is useful to learn the purpose of measurement, the methods of measurements, errors associated with measurements and to know the principle of transduction, classifications and the characteristics of different transducers and study its Biomedical applications.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: describe the purpose and methods of measurements.

CO2: explain different display and recording devices for various applications.

CO3: know the different display and recording devices.

CO4: use different biosensors in various applications to acquire the information.

SKILLS:

✓ *Determination of common instrument parameters.*

✓ *Finding the characteristics of transducers.*

✓ *Identify different transducers and sensors*

✓ *Verification through different measuring systems.*

ACTIVITIES:

- o *Measuring and calibrating a system*
- o *Measuring displacement, pressure.*
- o *Measuring temperature, capacitance, inductance for biomedical applications*
- o *Recording and displaying of parameters.*

UNIT - 1 **L-9**

SCIENCE OF MEASUREMENT: Measurement System, Instrumentation, Classification and Characteristics of Transducers, Static and Dynamic, Errors in Measurements, Calibration, Primary and secondary standards.

UNIT - 2 **L-9**

DISPLACEMENT, PRESSURE AND TEMPERATURE SENSORS: Strain Gauge- Gauge factor, Sensing elements, Configuration, Unbounded strain gage, Biomedical applications; Strain gauge as displacement andPressure transducers, Capacitive transducer, Inductive transducer, LVDT; Passive types- RTD materials and range, Relative resistance vsTemperature characteristics, Thermistor characteristics, Biomedical applications of Temperature sensors; Active type-Thermocouple,Characteristics.

UNIT - 3 **L-9**

PHOTOELECTRIC AND PIEZO ELECTRIC SENSORS: Phototube, Scintillation counter, Photo Multiplier Tube (PMT), Photovoltaic, Photo conductive cells, Photo diodes, Phototransistor, comparison of photoelectric transducers, Spectro photometric applications of photo electric transducers; Piezoelectric active transducer and biomedical applications as pressure and Ultrasound transducer.

UNIT - 4 **L-9**

SIGNAL CONDITIONING AND SIGNAL ANALYSER: AC and DC Bridges, Wheat stone bridge, Kelvin, Maxwell, Hay, Schering – Concepts of filters, Preamplifier,Impedance matching circuits,Isolation amplifier, Spectrum analyzer.

UNIT - 5 **L-9**

DISPLAY AND RECORDING DEVICES: Digital voltmeter, Multi meter, CRO,Block diagram, CRT – Vertical and horizontal deflection system, DSO, LCD monitor, PMMC writing systems, Servo recorders, Photographic recorder, Magnetic tape recorder, Inkjet recorder, Thermal recorder.

LABORATORY EXPERIMENTS

Course Outcomes:

Student will be able to:

- have a knowledge on the pressure sensors, how they care used.
- have a knowledge on how the temperature sensors are used.
- signal conditioning for the sensors and transducers.

List of Experiments : **Total hours:30**

I. Study the characteristics of following Transducers:

1. Thermistors, Thermocouple, RTD
2. Potentiometric transducer
3. Strain Gauge and Load Cell
4. LVDT
5. Capacitive transducer (Linear and Angular)
6. Piezoelectric transducer

7. Photoelectric transducer(LDR)
8. Hall Effect transducer

II. Signal conditioners for the following transducers:

(i) Piezoelectric transducers

(ii) Thermocouple

(iii) Phonocardiography transducer

(iv) Strain gauge (v) LVDT

(vi) Plethysmographic transducer

(vii) Capacitive transducer

(viii) Electromagnetic flow transducer

(ix) Optical transducer

16EL103 PROFESSIONAL COMMUNICATION LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The Professional Communication Laboratory course is aimed at improving professional communication skills (LSRW – Listening, Speaking, Reading and Writing) of undergraduate students and preparing them for their profession as engineers and managers. This course will help students to understand professional communication and personality as two interlinked spheres of influence, and provide them with exposure to conventions of corporate communication involved in the functioning of the business world.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: clear industry recognized certification such as BEC Vantage by the University of Cambridge.

CO2: stand out both in the professional setting as well as for further pursuits in the academic world.

CO3: succeed confidently in all four critical components of communication - LSRW (listening, speaking, reading and writing).

SKILLS:

✓ *Grammar rules in writing sentences, paragraphs and paraphrasing.*

✓ *Compose business emails, memos, letters, reports and proposals.*

✓ *Comprehend business articles and documents.*

✓ *Use of expressions in professional context and acquire presentation skills like one minute talk and pair discussion.*

✓ *Familiarize and comprehend British accent by listening to recorded speeches and discussions.*

UNIT - 1 **LEARNING-3 HRS+ PRACTICE -3HRS =06 HRS**

BUSINESS ENGLISH VOCABULARY: Glossary of most commonly used words (formal and informal usage) **Elements of Technical Writing**- Sentence structure, reducing verbosity, arranging ideas logically, building coherence, paragraph level and document level, topic sentence, cohesive devices, transitional words, paraphrasing and précis-writing.

Mechanics of Writing- Stylistic elements, the rapporteur, the purpose, the reader's viewpoint (audience), elementary rules of grammar, choice of diction, elementary principles of composition, matters of form, punctuation, conventions of business communication, language and professional tone, weak links in business correspondence, ethical concerns in business writing, code of conduct (not sending illegal, offensive, disparaging personal remarks or comments) in written business communication.

UNIT - 2 **LEARNING-3 HRS+ PRACTICE -3HRS =06 HRS**

BUSINESS CORRESPONDENCE: E-mail- nature and scope, e-mail etiquette, clear call for action, common errors in composing e-mails, office communication such as meeting agenda and minutes of the meeting, notice, circular and memo.

Letter Writing - Formal and informal letters, structure of formal letters, expressions of salutations, different types of letters [such as sales letter, complaint letter, response to the complaint letter (dispute resolution), letter of permission, letter of enquiring, claim letter, letter of apology etc]; Introductory and concluding paragraphs and clear call for action.

PROFESSIONAL PROPOSAL/REPORT: Differentiating proposals and reports, Drafting formal business proposals, types of reports such as factual reports, feasibility reports and survey reports, parts of a report (such as title page, declaration, acknowledgements, table of contents, abstract, introduction, findings, conclusions, recommendations, citations, references and appendices).

UNIT - 3 **LEARNING-3 HRS+ PRACTICE -3HRS =06 HRS**

SPEAKING: Speaking in business context, assertiveness, politeness, making requests, queries and questions, negotiations, asking for information, offering suggestions, conflict resolution, contacting clients, initiating, addressing delegates (in public), features of a good power point presentation (making the PPT), delivering the presentation effectively, telephone etiquettes, delivering seminar/proposal/ report effectively, team meeting etiquettes (face to face and conference call), making effective one minute presentations.

UNIT - 4 **LEARNING-3 HRS+ PRACTICE -3HRS =06 HRS**

READING: Reading and comprehending business documents, learning business register, regularizing the habit of reading business news, suitable vocabulary, skimming and scanning text for effective and speedy reading and dealing with ideas from different sectors of corporate world in different business contexts.

UNIT - 5 **LEARNING-3 HRS+ PRACTICE -3HRS =06 HRS**

LISTENING: Specific information in business context, listening to telephonic conversations/messages and understanding the correct intended meaning, understanding the questions asked in interviews or in professional settings, summarizing speaker's opinion or suggestion and enable active listening.

TEXT BOOKS: BEC

1. G. B. Hart, "Cambridge English Business Bench Mark: Upper Intermediate', 2nd edition, CUP, 2004.
2. CUP, Cambridge: BEC VANTAGE: Practice Tests, CUP, 2002.

ONLINE REFERENCES:

1. http://www.cambridgeenglish.org/exams/business-certificates/business vantage/preparation/
2. https://www.youtube.com/watch?v=qxFtn9pGaTI.

ACTIVITIES:

- *Basic grammar practice, framing paragraphs on topics allocated.*
- *Paraphrasing an article or a video in your own words. Finding topic sentences in newspaper articles.*
- *Finding out new words from a professional viewpoint. Understanding the meaning and its usage.*
- *Perusing samples of well prepared proposals and reports.*
- *Draft different proposals/reports on topics assigned.*
- *Watching videos/ listening to audios of business presentations.*
- *Classroom activities of team and individual presentations.*
- *Using PPTs, mock exercises for BEC speaking.*
- *Presenting (speaking) the written components completed in Unit 1.*
- *Hand-outs; matching the statements with texts.*
- *Finding missing appropriate sentence in the text from multiple choice, multiple choices.*
- *Using right vocabulary as per the given context and editing a paragraph.*

BM301 - MICROPROCESSORS AND MICROCONTROLLERS FOR BIOENGINEERS

Course description and Objectives:

This course introduces basic architecture and operation of microprocessor and microcontroller to the student. The course objective is to study the architecture and addressing modes of 8086/8051 and to know the importance of different peripheral devices and their interfacing to 8086.

Course Outcome:

Upon successful completion of this course, students should be able to:

- *Impart knowledge on the architecture and software aspects of microprocessor 8086*
- *Write assembly language program in 8086 for various application.*
- *Create the memory and IO interfacing techniques with 8086 and 8051*
- *Give an overview on the architecture and basic concepts of microcontroller*
- *Write assembly language program in microcontroller 8051 for various application*

UNIT - I

Introduction to microprocessors: Evaluation of microprocessors, 8086 microprocessor, architecture, register model, physical address generation, Pin diagram of 8086, addressing modes ,Interrupts of 8086, Interrupt vector table

UNIT – II

Interfacing of 8086 with programmable devices:, interfacing of 8086 with 8255 PPI(interfacing with switches and LEDs, ADC and DAC) , Direct Memory Access (DMA) and serial communication interface(USART)

UNIT -III

Introduction to Microcontroller: Differences between microprocessor and microcontrollers, 8051

Architecture, Internal & External memory organization, Pin diagram, addressing modes, Instruction set and assembly language programming ,Interrupts of 8051, Interfacing external memory to 8051,.ARM7TD.

UNIT IV

Arduino- Introduction, features and importance -Types of Arduino boards- arduino UNO - layout-arduino IO- Install the Arduino *IDE* - Arduino-compatible shields.

UNIT V

Coding structure and interfacing examples - Data types and operators,Function, Control statements [if, if… else, switch case.],Loop statements[while, for, do… while.]- Common functions. Interfacing examples

	4	-	-	4	4

BM303 - BIOMEDICAL INSTRUMENTATION

Course description and Objectives:

The study of Bio potentials and electrodes are used to construct instrumentation systems to acquire and process different physiological signals. The use of display devices and recorders are also considered, and can be used to display or record type acquired signals. The students learn about analytical instruments and their working features along with their medical applications.

Course Outcomes:

Upon Completion of the Course the students will be able to

- *Explain the origins of various bio potentials and their conduction and propagation.*
- *Explain various biomedical instruments.*
- *Gain knowledge on circuitry behind medical instruments.*
- *Explain the principles of chemical analysis instruments.*

UNIT-I - Introduction to Medical Instrumentation: Block diagram of a medical instrumentation system, Bio-signals: Origin and characteristics of Biopotentials-ECG, EEG, EGG, EMG, ENG, EOG, and ERG; Problems encountered with measurements from human beings; Generalized medical instrument specifications, Electrode-Electrolyte Interface, Half cell potential, Offset Voltage; Types of Electrodes- external; Internal and Microelectrodes; Mathematical Treatment of Electrodes: Equivalent circuits and applications.

UNIT-II - Medical display Devices and recorders: Display Devices: Basic requirements for the display and recording of Bio-signals, Types of medical display devices. Medical recorders: Classification of recorders, PMMC writing systems. General features of ink-jet, thermo-sensitive and optical recorders. Oscilloscopes: Basic description, Cathode Ray Oscilloscope (CRO), Dual beam oscilloscope, Analog storage oscilloscope, Digital storage oscilloscope, Medical, Multibeam & Non-fade display systems. Liquid crystal displays: Introduction, Passive-matrix and active –matrix addressed LCDs.

UNIT III - Cardiac Instrumentation: Electrocardiography: Block diagram. Circuits, electrodes and their placement, Lead configuration and general ECG waveforms, ECG monitors: Single channel& multi-channel ECG systems; Holter monitors, Stress test systems. Blood Pressure measurement: Introduction to blood pressure; Direct and indirect methods of Blood Pressure measurements; Blood Flow measurement: Introduction to hemodynamics,Electromagnetic and Ultrasonic techniques of Blood flow measurement, Heart sounds: Origin of Heart Sounds, types of microphones for heart sound measurement, and non-contact type of measurement, Phonocardiography.

UNIT -IV - Neuro-muscular Instrumentation: Electroencephalography: EEG-Block diagram and circuits, electrodes and their placement, Lead configuration and general EEG graphs, Evoked potentials and their measurement. Filters for EEG rhythm analysis, Electromyography: Introduction to EMG signals, EMG-Block diagram and circuits; Electrodes and their placement, Nerve conduction velocity determination using EMG, Stimulators for EMG recording.

UNIT V - Medical Analytical Instrumentation: Methods of chemical analysis. Absorption Photometry, emission photometry; Flurometry, Colorimeter, spectrophotometer, Flame photometer, Mass spectrophotometer, Electrophoresis, chromatography, blood gas analyzer, Semi and fully automated analyzers.

BM305 - DIAGNOSTIC AND THERAPEUTIC EQUIPMENT- I

Course description and Objectives*:*

The student should be made to:

Understand the medical devices applied in measurement of parameters related to cardiology, neurology and the methods of continuous monitoring and transmitting them .Learn some of the cardiac assist devices .Learn to measure the signals generated by muscles.Understand the need and use of some of the extracorporeal devices

Course Outcomes:

At the end of the course, the student should be able to:

- *Use different medical devices applied in measurement of parameters related to cardiology, neurology*
- *Explain about cardiac assist devices, its continuous monitoring and transmission*

  Measure signals generated by muscles

UNIT I - CARDIAC EQUIPMENT

Electrocardiograph, Normal and Abnormal Waves, Heart rate monitor, Holter Monitor, Phonocardiography, Plethysmography. Cardiac Pacemaker- Internal and External Pacemaker– Batteries, AC and DC Defibrillator- Internal and External.

UNIT II - NEUROLOGICAL EQUIPMENT

Clinical significance of EEG, Multi-channel EEG recording system, Epilepsy, Evoked Potential–Visual, Auditory and Somatosensory, MEG (Magneto Encephalo Graph). EEG Bio Feedback Instrumentation.

UNIT III - SKELETAL MUSCULAR EQUIPMENT

Generation of EMG, recording and analysis of EMG waveforms, fatigue characteristics, Muscle stimulators, nerve stimulators, Nerve conduction velocity measurement, EMG Bio Feedback Instrumentation.

UNIT IV- PATIENT MONITORING AND BIOTELEMETRY

Patient monitoring systems, ICU/CCU Equipments, Infusion pumps, bed side monitors, Central consoling controls, Radio Telemetry (single, multi), Portable and Landline Telemetry unit, Applications in ECG and EEG Transmission.

UNITV - EXTRA CORPOREAL DEVICES AND SPECIAL DIAGNOSTIC TECHNIQUES

Need for heart lung machine, functioning of bubble, disc type and membrane type oxygenerators, finger pump, roller pump, electronic monitoring of functional parameter; Hemo Dialyser unit, Lithotripsy, Principles of Cryogenic technique and application, Endoscopy, Laproscopy. Thermography – Recording and clinical application, ophthalmic instruments.

III Year B.Tech. Biomedical I - Semester

L	T	P	To	C
4	-	-	4	4

BM307 - ELECTRONICS ENGINEERING - II

Course Description and Objectives:

This course introduces the theoretical and circuit aspects of op-amp, timer, which are thebackbone for the basics of linear integrated circuits and to understand the various linear and non-linear applications of op-amp deals with fundamentals of number systems, Boolean expressions which are used to realize combinational and sequential circuits with their logic families.

Its objective is to introduce the concepts and techniques associated with the number systems and codes, to minimize the logical expressions using Boolean postulates, to design various combinational and sequential circuits and to provide with a sufficient number of applications for the techniques and mathematics used in this course.

Course Outcomes:

Students will be able to:

- explain the application of analog ics in the designing circuit.
- do applications of digital ics.
- understand the basic of the digital systems.
- design various functional circuits using these ics.
- understand the basic of the digital systems.

UNIT I NUMBER SYSTEMS AND LOGIC GATES

Decimal, Binary, Octal and Hexadecimal Numbers.-Conversion between these number systems.- Complements r’s and (r-1)’s complements-subtraction using complements – Encoding numbers and characters using Binary digits –Binary coded Decimal –Gray code - Binary to Gray code conversion –ASCII Code. Logic gates – Truth tables – NOT, AND, OR, NOR, NAND, XOR, XNOR - Boolean Laws and theorems – Solving Boolean expressions, Truth Tables and Logic circuits – The Karnaugh Map – half adder, full adder, Multiplexers and Demultiplexers - Decoders and encoders.

UNIT II REGISTERS AND COUNTERS

Flip Flops – RS, D, T, JK Flip Flops – Characteristic equations, exciting tables – JK Master – Slave flip-flop – Universal shift register; Design of modulo-N counters – counter design using state diagram.

UNIT III OPERATIONAL AMPLIFIERS

The characteristics of Ideal Operation – slew rate, offset voltage, bias current, CMRR, bandwidth - equivalent circuit of an op-Amp – virtual ground concept – Linear applications of op-amp – inverting and noninverting amplifier, summing, subtracting, averaging amplifier - voltage to current converter – current to voltage converter – Differential amplifiers – differentiator and integrator; Nonlinear applications – comparator - Schmitt Triggers – Precision Diode Half wave and full wave rectifiers – Average detectors – peak detector

UNIT IV ACTIVE FILTERS AND SIGNAL GENERATOR

Active filters (first and second order) – Low pass, high pass, band pass filters, band reject filters (notch filters). Oscillators - RC Phase shift and Wein-bridge. Waveform generators - Square, triangular and saw tooth.

UNIT V TIMER, PLL, A/D AND D/A CONVERTERS

555 Timer (internal diagram) and its applications – monostable multivibrator, astable multivibrator. Phase locked Loop (565 - block diagram approach) and its applications - Frequency multiplication, Frequency translation, voltage to frequency and frequency to voltage converters; DAC – Binary weighted DAC and R-2R DAC. ADC – single slope and dual slope ADCs, successive approximation ADC

BM309 - PHYSIOLOGICAL CONTROL SYSTEMS

***Course description and Objectives**:*

This course is designed to gain basic knowledge about the concepts of control systems and study its application in physiological modeling. To understand the system concepts and different mathematical modeling techniques applied in analyzing any given system.

Course Outcomes:

Upon Completion of the Course the students will be able to

- *Analyze the given system in time domain and frequency domain*
- *Know techniques to plot the responses iboth domain analyses using various plots.*
- *Explain concepts of physiological modeling sysyems and apply them to understand biological systems.*

UNIT-I Open and closed loop systems; Mathematical models of physical systems, Transfer functions; Block diagram algebra, Signal flow graphs.Feedback characteristics of control systems; Control systems and components; DC and AC servomotors, Principles of stepper motors.

UNIT-II Standard test signals, Time response of first order and second order systems; Design specifications of second order systems; Proportional controller; Proportional derivative controller; Proportional-Integral controller Proportional-Integral-Derivative controller Performance indices of control systems; Necessary conditions for stability; Hurwitz and Routh stability criteria, Relative stability.

UNIT-III Concept and construction of root locus, Root contours, Frequency response analysis, Correlation between time and frequency response, Bode plots, Stability in frequency domain,Nyquist stability criteria.

UNIT-IV Difference between general control systems and physiological control systems, examples of positive and negative feedback physiological control systems; Body temperature Regulation; Blood glucose regulation, Pupil Control System, Visual Fixation System, Oculo-motor System, Muscle stretch reflex, Skeletal muscle Servo-mechanism.

UNIT-V Cardiovascular Control Systems-Regulation of heart rate, blood pressure and cardiac output, Respiratory Control system-Chemical regulation of ventilation, Cheyne Stokes breathing.

BM311 - BIO INFORMATICS

Course description and Objectives*:*

The student should be made to:

Expose to the need for Bioinformatics tools. Be familiar with the modeling techniques. Learn microarray analysis. Expose to Pattern Matching and Visualization.

Course Outcomes:

Upon Completion of the Course the students will be able to:

UNIT - I - INTRODUCTION

Need for Bioinformatics technologies – Overview of Bioinformatics technologies Structural bioinformatics – Data format and processing – Secondary resources and applications – Role of Structural bioinformatics - Biological Data Integration System.

UNIT - II - DATAWAREHOUSING AND DATAMINING IN BIOINFORMATICS

Bioinformatics data – Data warehousing architecture – data quality – Biomedical data analysis – DNA data analysis – Protein data analysis – Machine learning – Neural network architecture and applications in bioinformatics.

UNIT - III - MODELING FOR BIOINFORMATICS

Hidden markov modeling for biological data analysis – Sequence identification –Sequence classification – multiple alignment generation – Comparative modeling –Protein modeling – genomic modeling – Probabilistic modeling – Bayesian networks – Boolean networks - Molecular modeling – Computer programs for molecular modeling.

UNIT - IV - PATTERN MATCHING AND VISUALIZATION

Gene regulation – motif recognition – motif detection – strategies for motif detection – Visualization – Fractal analysis – DNA walk models – one dimension – two dimension – higher dimension – Game representation of Biological sequences – DNA, Protein, Amino acid sequences.

UNIT - V - MICROARRAY ANALYSIS

Microarray technology for genome expression study – image analysis for data extraction – preprocessing – segmentation – gridding – spot extraction – normalization, filtering – cluster analysis – gene network analysis – Compared Evaluation of Scientific Data Management Systems – Cost Matrix – Evaluation model - Benchmark – Tradeoffs

BM313 - TOTAL QUALITY MANAGEMENT

Course description and Objectives:

To facilitate the understanding of Quality Management principles and process.

Course Outcomes:

Upon Completion of the Course the students will be able to

- *Apply the tools and techniques of quality management to manufacturing and services processes.*
- *Ascertain the standards specific to product selection and development of project related*

UNIT - I - INTRODUCTION

Introduction - Need for quality - Evolution of quality - Definitions of quality - Dimensions of product and service quality - Basic concepts of TQM - TQM Framework - Contributions of Deming, Juran and Crosby - Barriers to TQM - Quality statements - Customer focus - Customer orientation, Customer satisfaction, Customer complaints, Customer retention - Costs of quality.

UNIT - II - TQM PRINCIPLES

Leadership - Strategic quality planning, Quality Councils - Employee involvement - MotivationEmpowerment, Team and Teamwork, Quality circles Recognition and Reward, Performance appraisal - Continuous process improvement - PDCA cycle, 5S, Kaizen - Supplier partnership - Partnering, Supplier selection, Supplier Rating.

UNIT - III - TQM TOOLS AND TECHNIQUES I

The seven traditional tools of quality - New management tools - Six sigma: Concepts, Methodology, applications to manufacturing, service sector including IT - Bench marking - Reason to bench mark, Bench marking process - FMEA - Stages, Types.

UNIT - IV - TQM TOOLS AND TECHNIQUES II

Control Charts - Process Capability - Concepts of Six Sigma - Quality Function Development (QFD) - Taguchi quality loss function - TPM - Concepts, improvement needs - Performance measures.

UNIT - V - QUALITY

Need for ISO 9000 - ISO 9001-2008 Quality System - Elements, Documentation, Quality Auditing - QS 9000 - ISO 14000 - Concepts, Requirements and Benefits - TQM Implementation in manufacturing and service sectors.

BM315 - MICROPROCESSOR AND MICROCONTROLLER FOR BIO ENGINEERS LAB

PART A STUDY EXPERIMENTS:

1. Software Downloading / Installing & Interface
2. Basic Code
3. Sensors: Potentiometers
4. Sensor: Infrared Distance
5. Actuator: Servo Motor
6. Sensor: Force, Bend, Stretch
7. Sensor: Accelerometer, Gyro, IMU
8. Shield: Wheatstone Bridge & LCD
9. Programming Arduino Platforms Using a Different IDE

PART B PROGRAMMING:

1. Blinking LED
2. Write an Arduino program to control LED using switch SW
3. Write an Arduino program to control the six LEDs using the six corresponding switches
4. Write an Arduino program to write your name
5. Write an Arduino program to write your name in the first line and your roll number in the second line
6. Write an Arduino program to read the LM35 sensor, convert the value into temperature and display it on the serial monitor
7. Write an Arduino program to read the LM35 sensor, convert the value into temperature and display it on the LCD
8. Write an Arduino program to read the LDR sensor and display it on the serial monitor.

BM317 - BIOMEDICAL INSTRUMENTATION LAB

LIST OF EXPERIMENTS:

I. Design systems

1. Experiment on Electrodes- ECG, EEG, EMG
2. Design/Fabrication and test:
   (i) ECG system
   (ii) EEG system
   (iii) EMG system
   (iv) GSR system

II. Clinical Experiments:

1. Colorimeter
2. Spectrophotometer
3. Electrophoresis Apparatus (Paper and Gel)
4. Body mass index experiment
5. Tuning fork experiment to test the hearing ability of the subject
6. Blood Pressure measurement by using Sphygmomanometer

III. Design Experiments

1. Design of Instrumentation amplifiers for ECG, EEG, and EMG
2. Design of filters for ECG, EMG, and EEG.
3. Common Mode Rejection Ratio (CMRR) of Medical instrumentation amplifier
4. Design of RC phase shift oscillator for LVDT.

TEXT BOOKS:

HS304 PROFESSIONAL COMMUNICATION LAB

Course description and Objectives:

The Professional Communication exposes students to conventions of corporate communication and documentation procedures involved in the day-to-day functioning of the business world. The course is aimed at improving written communication skills of undergraduate students and preparing them to meet professional challenges in the work spheres. Writing and Personality are not two exclusive spheres of influence and this course will work on the relationship between professional writing and a personality that is able to meet the goals of an organization in creative and innovative ways.

Course outcomes:

- *To enable students to write logical sentences and paragraphs, use appropriate diction, grammar and punctuation.*
- *To expose them to the world of business and business register*
- *To make them compose clear and concise business messages*
- *To produce business documents for mailing to external recipients or intra-organizational circulation*
- *To enable them to speak business English for handling various business situations*

UNIT I-Mechanics of writing

- Elements of Technical Writing : Sentence structure - reducing verbosity - arranging ideas logically – building coherence - paragraph level and document level - topic sentence - cohesive devices – transitionals – paraphrasing – précis-writing.
- Mechanics of Writing: Stylistic elements – the rapporteur- the purpose- the reader (audience) -elementary rules of grammar- choice of diction - elementary principles of composition - matters of form – punctuation - conventions of business communication -language and tone - weak links in business correspondence - ethical concerns in business writing

UNIT II- Business Report Writing

- Parts of the Report: Writing an abstract - features of a good abstract – approach - compare and contrast - cause and effect.

Types of Technical Reports : Drafting a technical proposal - formal and informal proposals - factual reports, feasibility reports, survey reports – parts of a report - title page –declaration – acknowledgements – table of contents - abstract – introduction – conclusion – citations – references - appendices - oral reports and presentations

UNIT III- Business Letter Writing

- Letter-Writing - Formal and informal letters - structure of formal letters - expressions of salutations, introductory and concluding paragraphs - different types of letters - sales letter - complaint letter - adjustment letter - letter to the editor - covering letter - claim letter – letter of condolence.

UNIT IV- Business E- writing

- E-mail – nature and scope - e-mail etiquette – Common Errors in composing e-mails –
- Quotations - Inviting quotations - sending quotations –placing orders
- Office Communication - agenda - notice - circular
- Effective Resume-Writing: Structure and presentation - defining career objective - projecting one's strengths and skill-sets
- Summarizing - formats and styles - covering letter.

UNIT V -Business visual presentations

- Business Proposals: Drafting business proposals - calculating profit and loss-averages - ratios and proportions – partnership - simple interest - compound interest - calculating volumes and areas
- course of action - cause and effect- theme detection - making judgments -logical deductions - analyzing arguments – syllogisms -

- Venn diagrams - matching definitions -verbal reasoning - numerical reasoning - working out justifications.

EC431 - DIGITAL SIGNAL PROCESSING

***Course description and Objectives**:*

Understanding sampling and reconstruction in both the time and frequency domains .Understanding linear time-invariant systems, system properties, the convolution sum, and properties of convolution.Understanding the system frequency response, magnitude response and phase response. Understanding the Z-transform and its application to identifying system properties, solving difference equations, and determining the frequency response of a system.Understanding MATLAB as a tool for signal processing.

Course Outcomes:

Upon successful completion of this course, students should be able to:

- *Design digital IIR filters by designing prototypical analog filters and then applying analog to digital conversion techniques such as the bilinear transformation.*
- *Design digital FIR filters using the window method.*
- *Analyze signals using the discrete Fourier transform (DFT).*
- *Understand circular convolution, its relationship to linear convolution, and how linear convolution can be achieved via the discrete Fourier transform.*
- *Understand the Decimation in time and frequency FFT algorithms for efficient computation of the DFT.*
- *Alter the sampling rate of a signal using decimation and interpolation.*

UNIT - I

Introduction: Review of Signals and Systems, linear shift invariant systems, stability, and causality; Linear constant coefficient difference equations: Impulse response, step response, response to arbitrary inputs. Frequency domain representation of discrete time signals and systems: Z-Transform and properties, analysis of linear time invariant systems using Z-domain.

UNIT - II

Frequency Analysis of Discrete Time Signals: Discrete Fourier representation of periodic sequences(DTFT), Properties, Frequency response.

Discrete Fourier Transform: Discrete Fourier transforms, Properties of DFT, linear convolution of sequences using DFT, Computation of DFT.

UNIT - III

Fast Fourier Transform: Fast Fourier transforms (FFT) - Radix-2 decimation in time and decimation in frequency FFT Algorithms, Inverse FFT, Radix-4 FFT, Filtering of long data sequences: Overlap save and overlap add methods.

UNIT - IV

FIR Filter Design & Realization: FIR System function, Characteristics of FIR Digital Filters, frequency response; Design of FIR Digital Filters using Window Techniques, Frequency Sampling technique; Structures of FIR: Direct form structure, cascade form structure, Linear Phase structure, signal flow graphs and transposed structures.

UNIT - V

IIR Filter Design & Realization: IIR System Function, Analog filter approximations – Butter worth and Chebyshev, Design of IIR Digital filters from analog filters, Analog-to- Digital transformations. Structures of IIR : Direct form I and II, cascade form, parallel form, signal flow graphs and transposed Structures; Comparison of IIR & FIR filters.

CS218 - DATA STRUCTURES

Course Description and Objectives:

This course is aimed at offering fundamental concepts of data structures and explaining how to implement them. It begins with the basic concepts of data and data structures and introduces the primitive and non-primitive data structures in detail. It forms the basis for understanding various ways of representing data and its usage in different computing applications.

Course Outcomes:

The student will be able to:

- *apply advanced C programming techniques such as pointers, dynamic memory allocation, structures to develop solutions for particular problems.*
- *analyze characteristics of various data structures.*
- *differentiate between Graphs and Trees.*
- *understand the importance of sorting and applying it wherever useful.*
- *understand the usefulness of data structures in solving problems.*

UNIT I

Linear Data Structures-arrays Introduction – Data, Data type, Data Structures – Primitive and Non-primitive, Storage structures – Sequential and linked storage representations, File structures, Abstract Data Type (ADT). Overview of Structures-arrays, operations on arrays(retrieval of an element, search an element, insertion deletion of an element), manipulations on arrays such as finding the sum of elements of an array, adding two arrays, and reversing an array; Maximum sub sequence problem, Multi dimensional arrays.

UNIT II

Linked Lists Types of Linked Lists Singly Linked List, Doubly Linked List, Circular Linked List; Operations on linked lists-insertion, deletion, traversing forward/reverse order; Multi lists, Applications of Linked Lists; VFSTR UNIVERSITY Computer Science & Engineering 30.

UNIT III

Stacks And Queues Stacks – ADT, Array and Linked representations, Implementation and their applications; Queues – ADT, array and linked representations, Implementation of linear, circular and doubly-ended queues, and their applications.

UNIT IV

Non-linear Data Structures-trees Preliminaries –Binary Tree – ADT, array and linked representations, Binary tree properties, tree traversal, Implementation, Expression trees; The Search Tree ADT –Binary Search Trees, Implementation; AVL Trees – Single Rotations, Double rotations.

UNIT V

Graphs Graphs – ADT, definitions and properties, modeling problems as graphs, representation – adjacency matrix and adjacency list, basic graph traversals – breath first search and depth first search; Applications of graphs.

BM302 - DIAGNOSTIC AND THERAPEUTIC EQUIPMENTS – II

Course description and Objectives:

The student should be made to:

Gather basic knowledge about measurements of parameters related to respiratory system. Learn measurement techniques of sensory responses Understand different types and uses of diathermy units. Know ultrasound imaging technique and its use in diagnosis.Know the importance of patient safety against electrical hazard.

Course Outcomes:

At the end of the course, the student should be able to:

- *Explain about measurements of parameters related to respiratory system*
- *Describe the measurement techniques of sensory responses*
- *Analyze different types and uses of diathermy units*
- *Discuss ultrasound imaging techniques and its usefulness in diagnosis*
- *Outline the importance of patient safety against electrical hazard*

UNIT - I - RESPIRATORY MEASUREMENT STSTEM

Instrumentation for measuring the mechanics of breathing – Spirometer - Lung Volume and vital capacity, measurements of residual volume, pneumotachometer – Airway resistance measurement, Whole body plethysmography, Intra-Alveolar and Thoracic pressure measurements, Apnea Monitor. Types of Ventilators – Pressure, Volume, Time controlled. Flow, Patient Cycle Ventilators, Humidifiers, Nebulizers, Inhalators

UNIT - II -SENSORY MEASUREMENT

Psycho Physiological Measurements-for testing and sensory Responses, Electro occulograph, Electro retinograph, Audiometer-Pure tone, Speech; EGG (Electrogastrograph), galvanic skin resistance (GSR).

UNIT - III - DIATHERMY **9**

IR and UV lamp and its application.Short wave diathermy, ultrasonic diathermy, Microwave diathermy, Electro surgery machine - Current waveforms, Tissue Responses, Electro surgical current level, Hazards and safety procedures.

UNIT - IV - ULTRASONIC TECHNIQUE **9**

Diagnosis: Tissue Reaction, Basic principles of Echo technique, display techniques A, B and M mode, B Scan, Application of ultrasound as diagnostic tool – Echocardiogram, Echoencephalogram, abdomen, obstetrics and gynecology, ophthalmology.

UNIT - V - PATIENT SAFETY **9**

Physiological effects of electricity – important susceptibility parameters – Macro shock – Micro shock hazards – Patient s electrical environment – Isolated Power system – Conductive surfaces – Electrical safety codes and standards – Basic Approaches to Protection against shock, Protection equipment design, Electrical safety analyzer – Testing the Electric system.

BM304 - MEDI EMBEDDED SYSTEMS AND RTOS

***Course description and Objectives**:*

The student should be made to:

Able to write programs to interface with 8085/8086 .Write programs to interface with 8051. Know the concept of interfacing PIC microcontroller.

Course Outcomes:

Upon the successful completion of the course, the student should be able to:

- *Understand difference between micro processor and micro controller.*
- *Design small embedded systems with 8051.*
- *Use kernel objects.*
- *Know the design methodologies.*

UNIT- I

Embedded Systems: Basic concepts, requirements, categories, design challenges embedded operating system –Types, Hardware architecture, Software architecture, application software, communication software, and process of generating executable image, development /testing tools

UNIT - II

Embedded System Development —The development process, requirements engineering, design, implementation, integration and testing, packaging, configuration management, management of development projects

UNIT-III

The execution environment-memory organization, system space, code space, data space, unpopulated memory space, i/o space, system start up, interrupt response cycle, Functions Calls & Stack Frames, run time environment.

UNIT- IV

Architecture of Kernel, Tasks and Task Scheduler - Task States, Content Switching, Scheduling Algorithms, Rate Monotonic Analysis, Task Management Function Calls. Interrupt Service Routines, Semaphores, mutex, mailboxes, message queues, event registers, pipes, signals, timers, memory management, Priority Inversion Problem

UNIT - V

Design methodologies and design flows, case studies- fetal heart rate monitor, versatile drop foot stimulator, myoelectric arm, telemonitoring system

BM306 - BIO MATERIALS AND ARTIFICIAL ORGANS

Course description and Objectives:

The student should be made to

Learn characteristics and classification of Biomaterials. Understand different metals and ceramics used as biomaterials. Learn polymeric materials and combinations that could be used as a tissue .Replacement implants. Know artificial organ developed using these materials.

Course Outcomes:

At the end of the course, the student should be able to:

- *Analyze different types of Biomaterials and its classification.*
- *Perform combinations of materials that could be used as a tissue replacement implant.*

UNIT I STRUCTURE OF BIO-MATERIALS AND BIO-COMPATIBILITY

Definition and classification of bio-materials, mechanical properties, visco elasticity, wound healing process, body response to implants, blood compatibility.

UNIT II IMPLANT MATERIALS

Metallic implant materials, stainless steels, co-based alloys, Ti-based alloys, ceramic implantmaterials, aluminum oxides, hydroxyapatite, glass ceramics, carbons, medical applications.

UNIT III POLYMERIC IMPLANT MATERIALS

Polymerization, polyamides, Acryrilic polymers, rubbers, high strength Thermoplastics, medicalapplications; Bio polymers: Collagen and Elastin; Medical Textiles: Silica, Chitosan, PLA composites, Sutures, wound dressings; Materials for ophthalmology: contact lens, Intraocular lens; Membranes for plasma separation and Blood oxygenation.

VFSTR UNIVERSITY

UNIT - IV - TISSUE REPLACEMENT IMPLANTS

Small intestinal sub mucosa and other decullarized matrix biomaterials for tissue repair. Soft tissue replacements, sutures, surgical tapes, adhesive, Percutaneous and skin implants, maxillofacial augmentation, Vascular grafts, hard tissue replacement Implants, joint replacements, Pancreas replacement.

UNIT- V - ARTIFICIAL ORGANS

Artificial blood, Artificial skin, Artificial Heart, Prosthetic Cardiac Valves, Artificial lung (oxygenator), Artificial Kidney (Dialyzer membrane), Dental Implants.

BM308 - PHYSIOLOGICAL SYSTEMS MODELLING

Course description and Objectives:

The student should be made to

To appreciate the value and application of physiological models .To understand the process of modeling dynamically varying physiological systems. To understand methods and techniques to analyze and synthesize dynamic models .To develop differential equations to describe the dynamic behavior of physiological systems. To simulate and visualize dynamic responses of physiological models using computers . To solve and implement a modeling and design problem from inception to completion

Course Outcomes:

Upon completion of the course, students should able to

- *understand methods and techniques to analyze and synthesize dynamic models .*
- *develop differential equations to describe the dynamic behavior of physiological systems.*
- *simulate and visualize dynamic responses of physiological models using computers .*
- *solve and implement a modeling and design problem from inception to completion .*

UNIT I

Modeling concepts: The techniques of mathematical modeling; Classification of models characteristics of models, Metabolic and Endocrine Systems: Chemical reactions; Transport process. Diffusion, Transport by circulation, Controlled process.

UNIT II

Approaches to modeling: Mathematical representation of compartment and control system models; Perturbation schemes. Steady state; Dynamic

equilibrium, Convolution approach; Biological receptors: Receptor characteristics ,adaptation, rate sensitivity.

UNIT III

Glucose- insulin model to estimate insulin sensitivity; Insulin sensitivity; development of models of optimal complexity; Model decomposition; Models of glucose utilization; Model comparison; Insulin sensitivity index.

UNIT IV

Statistical approach modeling: Introduction, Discrete statistical signals; Continuous statistical signals; Averaging computations.

UNIT V

Tracer dynamics: Organ compartment model to relate Organ volume and flow-rate to monitored trace concentration, administration and its time profile; Model for measuring carbohydrate metabolism from monitoring of intravenously injected glucose.

EC320 - VLSI DESIGN

Course description and Objectives:

In this course, the MOS circuit realization of the various building blocks that is common to any microprocessor or digital VLSI circuit is studied. Architectural choices and performance tradeoffs involved in designing and realizing the circuits in CMOS technology are discussed. The main focus in this course is on the transistor circuit level design and realization for digital operation and the issues involved as well as the topics covered are quite distinct from those encountered in courses on CMOS Analog IC design.

Course Outcomes:

Upon completion of the course, students should

- *Explain the basic CMOS circuits and the CMOS process technology.*
- *Discuss the techniques of chip design using programmable devices.*
- *Model the digital system using Hardware Description Language.*

UNIT I MOS TRANSISTOR PRINCIPLE

NMOS and PMOS transistors, Process parameters for MOS and CMOS, Electrical properties ofCMOS circuits and device modeling, Scaling principles and fundamental limits, CMOS inverterscaling, propagation delays, Stick diagram, Layout diagrams.

UNIT II COMBINATIONAL LOGIC CIRCUITS

Examples of Combinational Logic Design, Elmore's constant, Pass transistor Logic, Transmission gates, static and dynamic CMOS design, Power dissipation – Low power design principles.

UNIT III SEQUENTIAL LOGIC CIRCUITS

Static and Dynamic Latches and Registers, Timing issues, pipelines, clock strategies, Memoryarchitecture and memory control circuits, Low power memory circuits, Synchronous andAsynchronous design

UNIT IV DESIGNING ARITHEMETIC BUILDING BLOCKS

Data path circuits, Architectures for ripple carry adders, carry look ahead adders, High speed adders, accumulators, Multipliers, dividers, Barrel shifters, speed and area tradeoff

UNIT V IMPLEMENTATION STRATEGIES

Full custom and Semi custom design, Standard cell design and cell libraries, FPGA building block architectures, FPGA interconnect routing procedures.

BM310 - DIGITAL SIGNAL PROCESSING LABORATORY

Course description and Objectives:

The student should be made to:

To implement Linear and Circular Convolution.To implement FIR and IIR filters.To study the architecture of DSP processor.To demonstrate Finite word length effect.

Course Outcomes:

Student will be able to

- *Demonstrate their abilities towards DSP processor based implementation of DSP systems.*
- *Analyze Finite word length effect on DSP systems.*
- *Demonstrate the applications of FFT to DSP.*
- *Implement adaptive filters for various applications of DSP.*

LIST OF EXPERIMENTS:

MATLAB / EQUIVALENT SOFTWARE PACKAGE

1. Generation of sequences (functional & random) & correlation.
2. Linear and Circular Convolutions.
3. Spectrum Analysis using DFT.
4. FIR filter design.
5. IIR filter design.
6. Multirate Filters.
7. Equalization.

DSP PROCESSOR BASED IMPLEMENTATION

8. Study of architecture of Digital Signal Processor.
9. MAC operation using various addressing modes.

10. Linear Convolution.
11. Circular Convolution.
12. FFT Implementation.
13. Waveform generation.
14. IIR and FIR Implementation.
15. Finite Word Length Effect.

LAB EQUIPMENT FOR A BATCH OF 30 STUDENTS (**2 students per system**)

- PCs with Fixed / Floating point DSP Processors (Kit / Add-on Cards) 15 Units

List of software required:

- MATLAB with Simulink and Signal Processing Tool Box or Equivalent Software in desktop systems -15 Nos
- Signal Generators (1MHz) – 15 Nos

III Year B.Tech. Biomedical II - Semester

L	T	P	To	C
-	-	3	3	2

BM312 - EMBEDDED SYSTEMS LAB

1. Study of different microcontroller development systems.
2. Digital interfaces.
3. Analog interfaces
4. Keyboard interface.
5. LCD Display: Alphanumeric mode.
6. LCD Display: Graphic mode.
7. PC interface: RS 232.
8. PC interface: Ethernet.
9. PC –Wireless LAN.
10. EZPic Motherboard based experiments: Pic 18 F 452

Note:
The experiments to be conducted under this lab should include design/ fabrication/ evaluation/technical reporting/case-studies/mini projects. The students should be encouraged to take up different challenging mini projects in this lab.

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	15	30	10	45	-	-	-	-

Course Description and Objectives:

It is aimed to offer various analytical as well as numerical methods to solve first and second order ordinary differential equations; to impart the knowledge of partial differentiation; to acquaint with the various methods to solve first and second order partial differential equations; to make the student familiar with applications of first order ordinary differential equations. To make the student to use different mathematical tools of MATLAB related to above concepts.

Course Outcomes:

The student will be able to:

- recognise and solve different types of first order ordinary differential equations.
- find the complementary functions and particular integral of second and higher order ordinary differential equations with constant coefficients.
- apply the knowledge of ordinary differential equations in some instances.
- solve ordinary differential equations, with initial conditions, numerically.
- find the local maxima/minima of given function of two variables.
- eliminate arbitrary constants/functions from given relations to form partial differential equations.
- solve linear and non-linear partial differential equations of standard types.
- classify second order partial differential equations and solve them.

SKILLS:

✓ *Solve given differential equation by suitable method.*

✓ *Compute numerical solutions of differential equation by apt method.*

✓ *Compute maxima/minima of given function.*

✓ *Solve given partial differential equation by appropriate method.*

ACTIVITIES:

- *Differentiate methods to solve given differential equation.*
- *Compute numerical solutions to differential equation and compare the result with MATLAB output.*
- *Compute maxima/minima of given function.*
- *Differentiate methods to solve given partial differential equation.*
- *Estimation of acoustic impedance of a given material.*

UNIT - 1 **L- 9, T-3**

FIRST ORDER DIFFERENTIAL EQUATIONS: Variable separable, Homogeneous differential equations, Linear differential equations, Bernoulli's differential equations, Exact and non-exact differential equations.

UNIT - 2 **L- 9, T-3**

SECOND ORDER DIFFERENTIAL EQUATIONS: Linear differential equations with constant coefficients, Homogeneous differential equations of second and higher order, Methods to find particular integral when RHS is of the form - e^{ax}, sinax, cosax and x^n.

UNIT - 3 **L- 9, T-3**

APPLICATIONS OF FIRST ORDER DIFFERENTIAL EQUATIONS: Orthogonal trajectories (including polar form), Newton's law of cooling, Law of natural growth and decay.

NUMERICAL METHODS TO SOLVE DIFFERENTIAL EQUATIONS: Taylor series method, Picard's method, Euler's and modified Euler's method, Runge-Kutta method.

UNIT - 4 **L- 9, T-3**

MAXIMA/MINIMA OF FUNCTIONS OF TWO VARIABLES: Review of partial differentiation - Partial derivatives, Partial derivatives of higher order; Homogeneous function, Euler's theorem, Total differential coefficient, Maxima and Minima of a function of two variables, Conditions for extreme values, Lagrange method of undetermined multipliers.

JACOBIANS : Definition, Properties, Jacobian of implicit functions.

UNIT - 5 **L- 9, T-3**

PARTIAL DIFFERENTIAL EQUATIONS: Formation of partial differential equations, Linear (Lagrange) equations, Method of multipliers, Non-linear partial differential equations (Types), Charpit's method, Second order linear equations with constant coefficients only, Classifications, Rules to find complimentary function and particular integral (special cases).

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours-30

1. Basic mathematical operations using MATLAB.
2. Solving simple expressions.
3. Limits.
4. Continuity.
5. Symbolic differentiation.
6. Symbolic integration.
7. Plotting of curves.
8. Plotting of surfaces.
9. Maxima & minima of functions of one variable.
10. Maxima & minima of functions of two variable.

11. Solving first order O.D.E.

12. Euler's Method and R-K Method.

10	45	-	10	-	10

Course Description and Objectives:

Technology is the experimental information for the physicist, where the theories can be tested. Recent technical developments have been the results of collaboration of physicists and engineers.

Study of engineering physics is a unique opportunity to learn the fundamental concepts of physics and apply this knowledge to both scientific and engineering problems.

The present course deals with various fields such as Lasers, Optical fibers, Photonics, Nano and functional materials, make the students to enrich basic knowledge in various fields of physics and apply the same in engineering fields.

Course Outcomes:

The student will be able to:

- understand the applications of ultrasonics and to calculate the velocity of ultrasonic waves in liquids.
- acquire basic knowledge in Non-destructive techniques.
- understand basic concepts of laser and optical fiber which help in designing and developing new devices in emerging fields.
- grasp the basics of quantum mechanics.
- understand the fabrication of solar devices.
- use nano science and technology for innovative and compact design.
- demonstrate synthesis, properties and applications of nanomaterials and functional materials.

SKILLS:

✓ *Determine the velocity of ultrasonics in a given liquid using interferometer.*

✓ *Study the wavelengths of light sources and lasers.*

✓ *Estimate the efficiency of a given solar cell.*

✓ *Learn about the type of the optical fiber and its ability to propagate light waves from its numerical aperture.*

✓ *Know voltage – current characteristics of a given light emitting diode.*

UNIT - 1 **L-9**

ULTRASONICS: Introduction, Production of ultrasonic waves - Piezoelectric method; Properties of ultrasonic waves, Types of ultrasonic waves, Determination of velocity of ultrasonic waves in solids and liquids, SONAR - Medical applications.

NON-DESTRUCTIVE TESTING: Introduction, Types, Visual inspection, Liquid penetrate testing, Ultrasonic Testing Systems, X - Ray radiography.

UNIT - 2 **L-9**

LASERS: Characteristics of laser light, Spontaneous and Stimulated emission of radiation, He-Ne laser, CO_2 laser, Semiconductor laser, Applications.

HOLOGRAPHY: Holography and applications.

FIBER OPTICS: Principle of optical fiber, Acceptance angle, Numerical aperture, Types of fibers, Dispersion and attenuation in optical fibers, Optical fiber communication system, Fiber optic sensors.

UNIT - 3 **L-9**

QUANTUM MECHANICS: Introduction, Matter waves, Schroedinger's time independent wave equation, Physical significance of the wave function, Particle in one dimensional potential well, Tunneling phenomenon.

FREE ELECTRON THEORY OF METALS: Introduction, Classical free electron theory, Electrical conductivity of metal, Quantum free electron theory, Fermi - Dirac distribution function and its variation with temperature.

PARTICLE ACCELERATORS: Introduction, Cyclotron, Synchrocyclotron, Betatron and applications.

UNIT - 4 **L-9**

SOLAR ENERGY: Solar radiation, Photovoltaic effect, Solar cells, Efficiency of solar cell, Solar thermal energy conversion systems.

PHOTONICS: LED, LCD, Photo conducting materials, Photo detectors, Photonic crystals, Non- linear optical behaviour of materials, Applications.

UNIT - 5 **L-9**

NANO MATERIALS: Introduction, Fabrication of nano materials - Ball milling - Sol-Gel method; Physical and chemical properties of nano materials, Applications.

FUNCTIONAL MATERIALS: Smart materials, Shape memory alloys, Chromic materials (Thermo, Photo and electro), Metallic glasses, Advanced ceramics, Composites, Fiber reinforced plastics/metals, Biomaterials.

TEXT BOOKS:

1. V.Rajendran, "Engineering Physics", 7th edition, McGraw Hill Education (India) Pvt.Ltd., 2014.
2. D.K. Bhattacharya and Poonam Tandon, "Engineering Physics", Oxford University Press, 2015.

REFERENCE BOOKS :

1. M.R. Srinivasan, "Engineering Physics", 1st edition, New Age International Publishers, 2008.
2. M.N. Avadhanulu & P.G. Kshirsagar, "Engineering Physics", 1st edition, Chand and Company Ltd., 1992.
3. Sukhatme S.P., "Solar Energy", 2nd edition, TMH publication, 2005.
4. Dr. Arumugam "Materials Science", 3rd edition, Anuradha Publications, 2002.

ACTIVITIES:

- *Estimation of acoustic impedance of a given material.*
- *Measurement of distances using ultrasonic range finder.*
- *Study of linear density of yarn/ fibre using Melde's experiment.*
- *Determination of refractive index of a given liquid using laser.*
- *Find the height of a room using laser.*
- *Identify the type of semi-conductor using Hall effect.*
- *Study of numerical aperture of optical fibres made of different materials.*
- *Design of solar panel to obtain required voltage.*
- *Evaluation of thermal conductivity of materials.*
- *Measure the temperature using thermo couple.*

16HS105 TECHNICAL ENGLISH COMMUNICATION

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	15	5	6	4	5

Course Description and Objectives :

To introduce students the specific use of English for the purpose of Technical Communication that would strengthen their skills in the areas of writing and speaking and thereby enable them to function effectively in their professional sphere. The objective of this course is to direct the students towards developing their technical writing skills in particular and overall language proficiency in general. It will be done by making students peruse good samples of technical writing covering a wide range of contemporary issues relevant to the engineering profession. Students will, also be revisiting, the fundamentals of grammar to get trained on use of standard English.

Course Outcomes:

The student will be able to:

- acquire an understanding of the rules of grammar.
- strengthen their reading and listening comprehension skills to follow the academic discourse in the engineering classroom.
- have a command of basic vocabulary related to different subject areas.
- have a grasp on the mechanics of writing and express their ideas through construction of simple texts.
- attain language proficiency to participate in the classroom discussions.

SKILLS:

✓ *Apply different sub skills like skimming, scanning, reading for information, reading for inference etc to understand different kinds of text.*

✓ *Apply different sub skills like top down, bottom up approaches to listening, and understand phonetic and phonological features of the English language to deconstruct long spoken discourses.*

✓ *Use functional vocabulary relevant to subject areas like environment, tourism, engineering, technology and media to express ideas lucidly.*

✓ *Use appropriate sentence structure, cohesive devices and diction to construct simple text in writing and regular correspondence like e-mails, letters etc.*

✓ *Capture and understand key points during class room discourses through applying sub skills of writing like note-making, paraphrasing and summarizing.*

UNIT - 1 **L-9**

- Text : **ENVIRONMENTAL CONSCIOUSNESS**
  (Climate Change, Green Cover, Pollution, Renewable vs. Non renewable energy sources (from Energy Unit)
- Grammar : Articles, Prepositions, Sentence types and construction
- Vocabulary : Root, Prefixes, Suffixes
- Composition : Paragraph writing (Descriptive and narrative)
- Laboratory Practice : Introduction to phonetics
  (Organs of Speech, Consonants, Vowels and Diphthongs, Syllable, Stress and Intonation)

UNIT - 2 **L-9**

- Text : **EMERGING TECHNOLOGIES**
  (Solar power, Cloud computing, Nanotechnology, Wind energy (to be covered from Energy unit))
- Grammar : Time and tense (Present-past-future; Helping verbs, Modals)
- Vocabulary : Synonyms, Antonyms
- Composition : Letter writing (Informal)
- Laboratory Practice : Grammar Practice (Speaking of past, present and future)

UNIT - 3 **L-9**

- Text : **TRAVEL AND TOURISM**
  (Advantages and disadvantages of travel-tourism, Atithi devo bhava, Tourism in India)
- Grammar : Subject-Verb agreement, Sentence construction
- Vocabulary : Idioms and phrases
- Composition : Letter writing (Formal)
- Laboratory Practice : Situational conversations – Role - Plays
  (Introducing, Greeting, Enquiring, Informing, Requesting, Inviting)

UNIT - 4 **L-9**

- Text : **ENGINEERING ETHICS**
  (Challenger disaster, Biotechnology, Genetic engineering, Protection from natural calamities, How pertinent is the nuclear option? An environment of energy (from Energy Unit))
  Avoiding sexist language (Gender Sensitization)
- Grammar : Sentence transformation (Degrees, Voice, Speech and Synthesis)
- Vocabulary : Phrasal verbs

  Composition : Note-making, Text, Nandan Nilekani's In Search of Our Energy Solutions (from Energy Unit)
  Summarizing, Text on “Flight from conversation” (New York Times)
- Laboratory Practice : Situational conversations, Role-Plays (Emotions, Directions, Descriptions, Agreements, Refusals, Suggestions)

ACTIVITIES:

- *Doing phonetic transcription of selected words from the list provided using talking dictionaries of AHD and CALD.*
- *Completing graded grammar exercises in Rosetta Stone.*
- *Completing graded listening and reading comprehension exercises in Rosetta Stone.*
- *Watching TED videos and making notes.*
- *Watching TED videos to paraphrase and summarize.*
- *Ad- making.*
- *Preparing brochure.*
- *Dialogue writing followed by role play.*
- *Poster designing.*
- *Team presentation with PPTs and Group Discussion.*

UNIT - 5 **L-9**

- Text : **MEDIA MATTERS**

  (History of media, Language and media, Milestones in media, Manipulation by Media, Thousands march against nuclear power in Tokyo (from Energy Unit), Entertainment media, Interviews)

- Grammar : Common errors
- Vocabulary : One-word substitutes
- Composition : E-mail – Short message service (SMS), Writing advertisements, Reporting; Social media - Blogging, Facebook, Twitter (acceptable and non acceptable content)
- Laboratory

  Practice : Group discussions – (Topics from Energy Unit), Dumping of nuclear wastes, Exploration of eco-friendly energy options, Lifting of subsidies on petrol, Diesel, LPG etc)

16CS101 BASICS OF COMPUTERS AND INTERNET

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course provides students with a working knowledge of the terminology, processes, and components associated with Computers and Internet. Students will get exposure to Building blocks of Computers, Operating Systems, Application software, Networking, Internet, World Wide Web, Security, Maintenance, Information Systems, and the application development processes.

Course Outcomes:

The student will be able to:

- understand the terms and concepts of Computer Science and Information Technology (hardware, software, networking, security, Internet/Web, and Technologies).
- use the products and services of computers.
- use Internet/Web services as a resource for developing shared applications.
- install different operating systems and application software.

SKILLS:

- ✓ *Assemble and disassemble the personal computer system.*
- ✓ *Install different desktop operating systems.*
- ✓ *Use the basic text processing, simple data analysis and data presentation tools.*
- ✓ *Configure network parameters.*
- ✓ *Secure the personal computer and information from various external threats.*

UNIT - 1 **L-10**

COMPUTING SYSTEMS: Introduction to computer, Computers for individuals, Importance of computers, Parts of computer system, Memory devices, Input and output devices, Types of monitors, Types of printers, Number systems, Bits and bytes, Text codes and types of processors.

UNIT - 2 **L-10**

OPERATING SYSTEMS: Types of operating systems, User interfaces, PC operating systems, Network operating systems, Types of software, Programming languages, Compiler and interpreter, Program control flow and algorithm.

UNIT - 3 **L-8**

NETWORKS AND DATABASES: Networking basics, Uses of network, Types of networks, Network hardware, Introduction to data bases and database management systems.

UNIT - 4 **L-8**

INTERNET AND WWW: Internet's services, World wide web, Browser setups, Using search engine, Email and other internet applications.

UNIT - 5 **L-9**

CYBER SECURITY: The need of computer security, Basic security concepts, Threats of users, Online spying tools, Threats to data, Cybercrime, Protective measures.

ACTIVITIES:

- *Prepare a report on various generations of computers and its peripherals.*
- *Disassembling and assembling of a personal computer system.*
- *Install the Linux operating system and other software required in a personal computer system.*
- *Connect the system to an Ethernet and configure the same.*
- *Prepare an MS Word Document.*
- *Prepare a spread sheet with various mathematical operations, charts and sorting etc.*
- *Make a report on power point presentation for the given topic.*

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- know the usage of the computer systems.
- setup the IDEs for the computer programming languages.
- get exposure on office automation tools like Microsoft Word, Excel, and power point.
- identify the different computer system and data threats and also protect them by installing antivirus software.

LIST OF EXPERIMENTS Total hours-30

1. Demonstrate the Personal Computer Peripherals and get a report on each peripheral.
2. Demonstrate the Personal computer assembling procedure and do the same.
3. Install wide varieties of free and open source operating systems.
4. Demonstrate Network Interface Card (NIC) configuration and any internet browsers options setup.
5. Demonstrate the Java Development Kit (JDK) installation and environmental variable (PATH) setup.

6. Demonstrate the following experiments using Office automation tools.
   a. Text formatting and table.
   b. Mathematical equations.
   c. Watermarking using Analysis tool.
   d. Calculate student mark details.
   e. Create four types of charts.
   f. Import external data, sort & filter using Power Point tool.
   g. Create text and images with effects.
   h. Create animation and sound effects.
7. Demonstrate the installation of anti-virus software to detect different types of virus programs.

TEXT BOOK :

1. Peter Norton, “Introduction to Computers”, 7th edition, Tata-McGrawHill, 2010.

REFERENCE BOOKS:

1. ITL Education Solution Limited, “Introduction to Computer Science”, 2nd edition, Pearson Education, 2011.
2. Eric Maiwald, “Fundamentals of Network Security”, 3rd edition, Tata-McGrawHill, 2004.

16CS102 COMPUTER PROGRAMMING

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
48	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	5	8	5	5

Course Description and Objectives:

This course is aimed at offering fundamental concepts of programming language to the students. It starts with the basics of C-programming and deals with the structure and various attributes required for writing a 'C' program. It also introduces various operators and control statements used in programming. Then it switches to functions and arrays. It goes on with strings, pointers, files & the user defined data types. As a first-level course in computer science, it forms the basis to understand usage of various attributes in writing a program.

Course Outcomes:

The student will be able to :

- understand the basic terminology used in computer programming to write, compile & debug programs in 'C' language.
- use different data types to design programs involving decisions, loops and functions.
- understand the allocation and Usage of dynamic memory.
- understand the usage of files & structures.

SKILLS:

- ✓ *Identify suitable data types for an application.*
- ✓ *Apply control statements for decision making problems.*
- ✓ *Use multidimension array for matrix application.*
- ✓ *Design a program to calculate average of a class.*
- ✓ *Analyze the difference between static & dynamic memory allocation.*

UNIT - 1 **L- 10, T-3**

INTRODUCTION TO C PROGRAMMING: Structure of C program - Comments, Processor statement, Function header statement, Variable declaration statement and Executable statement; C character set, Constants, Identifiers, Operators, Punctuations, Keywords, Modifiers, Identifiers, Variables, C scopes, Basic data types, Type qualifiers, Storage classes, Reading and writing characters, Formatted I/O.

UNIT - 2 **L-9, T-3**

OPERATORS AND CONTROL STATEMENTS: Operators - Assignment, Arithmetic, Relational, Logical, Bitwise, Ternary, Address, Indirection, Sizeof, Dot, Arrow, Parentheses operators; Expressions - Operator precedence, Associative rules; Control statements - Category of statements, Selection, Iteration, Jump, Label, Expression and Block.

UNIT - 3 **L-9, T-3**

FUNCTIONS AND ARRAYS: Function - Declaration, Prototype, Definition, Calling by value and call by address, Standard library functions and Recursive functions; Array - Declaration, Initialization, Reading, Writing, Accessing and Passing as a parameter to functions, 2D-arrays, Multidimensional arrays.

UNIT - 4 **L-9, T-3**

STRINGS AND POINTERS: Strings - Declaration, String library functions, Array of strings, Command line arguments; Pointers - Declaration, Initializing pointers, Multiple indirection, Relationship between arrays and pointers; Scaling up - Array of arrays, Array of pointers, Pointer to a pointer, Pointer to an array; Pointer to functions, Dynamic memory allocation functions.

UNIT - 5 **L-8, T-3**

STRUCTURES AND FILES: Structures - Declaration, Initialization and accessing, Array of structures and passing structures to functions, Structure pointers, Arrays and structures within structures, Unions, Bit-fields, Types and enumerations; Files - I/O and processing operations on text and binary files; Pre-processor directives.

ACTIVITIES:

- *Implement matrix operations.*
- *Implement malloc and calloc functions.*
- *Copy the content of one file into the other.*
- *Implement string manipulations functions.*

LABORATORY EXPERIMENTS

Course Outcomes:

Upon successful completion of this course, the student will be able to:

- write, compile and debug programs in C language.
- formulate problems and implement algorithms in C.
- develop programming components that efficiently solve computing problems in real-world.

LIST OF EXPERIMENTS Total hours-30

1. Compute the factors of a number.
2. Compute the average of 'n' numbers.
3. Find whether a number is palindrome or not.
4. Find whether a number is a power of 2 or not.
5. Compute the factorial of a number.
6. Implement any kind of operation (+,-,*,/,%) using a switch case.

7. Swap two values useing call by value and call by reference.
8. Using structure of arrays.
9. Find the reversal of a number.
10. Find the frequency of each number in the array.
11. Which takes 0's & 1's as input and the array should consist of all 0's first and then 1's.
12. Copy the first 10 words of a file into the other file.
13. Count the number of words in a file.
14. Create a structure which stores the student's information in a class.
15. Reverse the contents of the array.
16. Implement pointer of pointers.
17. Give n^{th} term of the Fibonacci number.
18. Find the factorial of a number using recursion.
19. Find the number of vowels in a file.
20. Access the structure and union members.

TEXT BOOK:

REFERENCE BOOKS:

1. Reema Thareja, "Introduction to C Programming", 2^{nd} edition, Oxford University Press India, 2015.
2. Herbert Schildt, C, "The Complete Reference", 4^{th} edition, Tata McGraw-Hill, 2000.
3. E. Balagurusamy, "Programming in ANSI C", 4^{th} edition, Tata McGraw- Hill, 2008.

16EE101 BASICS OF ENGINEERING PRODUCTS

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This course enables the students to understand the basics of civil, mechanical, electrical and electronics systems and components used in day-to-day life. It deals with construction materials, power generation principles and working of a few commonly used household appliances. Besides, the student will be able to identify/appreciate various concepts, service and maintainance of engineering products.

Course Outcomes:

The student will be able to:

- gain knowledge and hands-on experience on various engineering products.
- install, operate, maintain and troubleshoot basic mechanical, electrical and electronic appliances.
- understand the concept of conservation of energy.
- gain awareness on choosing appropriate construction materials.

SKILLS:

✓ *Identify UPS requirements for a given load.*

✓ *Provide a Lighting scheme for specific working environment.*

✓ *Design a composition of Heating element for a particular application.*

✓ *Trouble shoot issues relating to Immersion Heater and Induction Heater.*

✓ *Provide an earthing for Domestic Outlet.*

✓ *Select, Configure and maintain a few engineering appliances. Such as TV, Radio, Telephone, Mobile phone, Wifi Router, Micro oven, PA system etc.*

ACTIVITIES:

- *Trouble shooting of immersion heater and induction heaters.*
- *Disassembe and Assembe the Domestic Appliances such as Mixer Grinder, Fan etc.,*
- *Provide Earthing for Domestic Outlet.*
- *Design the Electric Wiring system for a prototype house.*
- *Design the UPS for a defined load.*
- *Practice assembly of a FM radio.*
- *Configure a Wifi Router for required number of users.*

UNIT - 1 **L-9**

WORKING PRINCIPLE OF AC, REFRIGERATOR, PUMPS, IC ENGINES AND SCREW JACK: Working principle of Air - Conditioner and Refrigerator, Components, Assembly and disassembly; Working principle of Centrifugal and Reciprocating pumps - Types, Parts and applications, Working principle of Screw jack and its components, Working principle of IC engines- 2 stroke and 4 stroke.

UNIT - 2 **L-10**

BRICKS: General, Qualities and Classification of bricks, Tests for bricks, Size and Weight of bricks,

Timber - Definition, Qualities of good timber, Decay of timber and Advantages of timber in construction.

CEMENTS: Types and composition of Cement, Setting of cement, Tests for physical properties of

cement, Different grades of cement.

AGGREGATES: Classification of aggregates, Source, Size and Shape of aggregates, Tests for aggregates.

STEEL: Types of steel, Physical properties and Mechanical properties of steel, Simple layout design, Paints, Tiles, fittings, Ventilation, Furniture and green house aspects.

UNIT - 3 **L-8**

ELECTRIC ENERGY SYSTEMS: Overview of Power System Structure, Conventional and Non Conventional Generations, Types of Turbines, Generators, Substations, Towers, Earthing procedure, Protection schemes, Single Phase and Three Phase Systems, Methods of Electrical Wiring Systems, Wiring procedure and calculations, Wiring methods, Un-Interruptible Power Supply (UPS), Components in UPS, Its functionality, Calculation of ratings for UPS components to a specific load.

UNIT - 4 **L-10**

LIGHT: Light Energy, Evolution of Light sources, Working of Incandescent, Fluorescent, MV, SV and LED Lamps, Comparison and Applications.

HEAT: Heat Energy, Modes of Heat Transfer, Resistance and Induction Heating, Comparison and applications.

MOTOR: Electric Motors, Classification, Construction and working principles of motors used in Domestic applications, Mixer grinder, Ceiling and exhaust fan, Hair dryer, Washing machine, Water pump, Air coolers, Vacum cleaner, Computer cooling motor, Electric bike.

UNIT - 5 **L-8**

HOUSE HOLD ELECTRONIC APPLIANCES: Working principles of television, Radio, Remote control, Telephone, Microwave oven, Cell phone, PA system, Induction stove, WiFi router and DTH.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours-30

Demonstration of Modelling / functioning / disassembly / assembly / fault rectification / understanding of the following.

1. Air-conditioners and Refrigerators
2. 2 Stroke and 4 Stroke Engines
3. Reciprocating Pumps

4. Power Screw Jack
5. Size and Water absorption capacity of Bricks
6. Initial and final setting time of Cement
7. Toughness value of coarse aggregates
8. Bulking of Sand
9. Earthing Schemes
10. Electric Wiring
11. UPS system
12. Immersion Heater, Induction Heater and Iron Box
13. Ceiling Fan and Mixer
14. Television
15 Radio
16. Remote Control
17. Telephone
18. Fax Machine
19. Mobile Phone
20. PA System

TEXT BOOKS:

1. M.S.Shetty, "Concrete Technology", 1st edition, S.Chand and Co, 2005.

6. Pravin Kumar, "Basic Mechanical Engineering", 1st edition, Pearson Publishers, 2013.

16HS104 ENGLISH PROFICIENCY AND COMMUNICATION SKILLS

Hours Per Week :

L	T	P	C
0	-	2	1

Total Hours :

L	T	P
0	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To equip the students with Functional English by exposing them to a wide range of language use in different contexts and thereby encourage them to use the language comfortably in real life situations. The objective of this course is to strengthen the comprehension skills of listening and reading by acquiring adequate vocabulary through perusing authentic materials gathered from news papers, journals and other mass communication media.

Course Outcomes:

The student will be able to:

- use functional English to speak and express themselves in different social contexts
- write simple letters, narratives, factual reports and descriptive passages for both academic and non-academic purposes in English.
- gain proficiency to undergo Preliminary English Test (PET), an Intermediate Level English Certification Test administered by Cambridge English Language Assessment, UK.

SKILLS:

✓ *Use appropriate words in right order for effective sentence formation, and writing short texts.*

✓ *Read and extract information from different texts and draw inferences by understanding elements like tone and transitional words.*

✓ *Understand short and long spoken discourses through analysis of elements like stress and intonation.*

✓ *Articulate clearly thoughts and ideas on simple every day topics.*

UNIT - 1 **P-6**

FUNCTIONS: Introducing Self/Others, Expressing needs/feelings/opinions (SWOT Analysis)

SKILL FOCUS:

Reading – Understanding factual information

Writing – Word order and sentence formation

Listening – Decoding for meaning following elements of stress, Intonation and accent

Speaking – Articulating syllables clearly, Speaking fluently with correct pronunciation

Vocabulary – Discerning to use right word for the given context

Grammar – Spellings, Use of Nouns, Adjectives, Verbs, Prepositions in the sentence structure

PRACTICE: Objective PET Units 1 - 6

UNIT - 2 **P-6**

FUNCTIONS: Defining; Describing People, Places, Things and Process.

SKILL FOCUS:

Reading – Inferences from sentences and short messages, True or False

Writing – Rewording, Sentence transformation, Convincing

Listening – Understanding the short messages and conversations

Speaking – Role-plays, Short conversations

Vocabulary / Grammar – Use of Adjectives/Adverbs, Comparatives and Superlatives

PRACTICE: Objective PET Units 7 – 12

UNIT - 3 **P-6**

FUNCTIONS: Describing Spatial and Temporal Relations, Giving Directions/Instructions

SKILL FOCUS:

Reading – Reading between the lines, Inferences, True/False

Writing – Developing hints, Writing short messages/paragraphs

Listening – Searching for factual information, Gap filling

Speaking – Snap Talks, JAM, Elocution

Vocabulary / Grammar – Prepositions, Phrasal Verbs, PET word list

PRACTICE: Objective PET Units 13 - 18

UNIT - 4 **P-6**

FUNCTIONS: Narrating, Predicting, Negotiating, Planning

SKILL FOCUS:

Reading – Reading for evaluation and appreciation, Comprehension

Writing – Letters, e-mails, 7 C's

Listening – Following long conversations / Interviews

ACTIVITIES:

- *SWOT Analysis.*
- *Snap talks.*
- *Spell Bee.*
- *Short conversations.*
- *Role play.*
- *Quiz.*
- *Elocution.*
- *JAM.*
- *Group. Discussion Debate.*
- *Team presentations.*

Speaking – Discussions, Debate, Descriptions

Vocabulary / Grammar – Modals, Conditionals, Verb forms (Time and Tense)

PRACTICE: Objective PET Units 19 – 24

UNIT - 5 **P-6**

FUNCTIONS: Requesting, Denying, Suggesting, Persuading

SKILL FOCUS:

Reading – Understanding factual information

Writing – Short Stories, Explanatory Paragraphs

Listening – Inferences from long speeches/conversations

Speaking – Announcements, Presentations

Vocabulary / Grammar - Punctuation, Cloze tests

PRACTICE: Objective PET Units 25 – 30

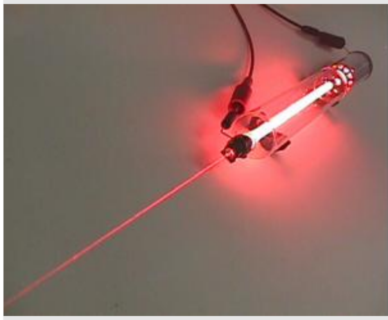
TEXT BOOK:

1. Louise Hashemi and Barbara Thomas, “Objective PET”, Student’s Book with Answers, 2nd edition, Cambridge University Press, 2015.

REFERENCE BOOKS :

1. Cambridge Preliminary English Test Without Answers 8.
2. Annette Capel and Rosemary Nixon, “Introduction to PET”, Oxford University Press.

16HS110 ENGINEERING PHYSICS LABORATORY



Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	45

Course objectives and Description:

This lab is intended to make the students realize the theoretical concepts of physics having hands on experience in conducting the experiments.The students have to perform at least ten from the list of experiments.

Course Outcomes:

The student will be able to:

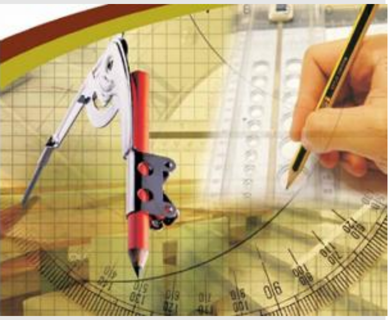
- realize the concept of resonance by conducting the experiments of AC sonometer and Melde's experiment.
- acquire the knowledge on magnetic field theory and thermal conductivity by conducting experiments, field along the axis of a circular coil and thermal conductivity of bad conductor
- understand the concepts of light by conducting the experiments of determination of wave length, numerical aperture of an optical fibre and also from V–I characteristics of Solar cell and LED.

LIST OF EXPERIMENTS

1. Determination of Velocity of ultrasonic waves in liquids.
2. Melde's Experiment - Transverse and Longitudinal modes.
3. Determination of wave length – Helium - Neon laser.
4. Determination of Planck's constant.
5. Determination of Frequency of Alternating current.
6. Field along the axis of a circular coil – Stewart and Gee's apparatus.
7. Band gap of semiconductor.
8. Determination of Hall coefficient.
9. Thermal conductivity of bad conductor - Lee's method.
10. Optical Fibre – Determination of numerical aperture.
11. Solar Cell – Efficiency.
12. Study of V – I characteristics of LED.
13. Seebeck effect - Determination of Seebeck coefficient of a thermo couple.

REFERENCE BOOKS:

1. Jayaraman, "Engineering Physics Laboratory manual", 1st edition, Pearson Education, 2014.
2. Engineering Physics laboratory Manual – Department of Physics, VFSTR University, 2016.



16HS108 ENGINEERING MATHEMATICS – II

Hours Per Week :

L	T	P	C
3	1	2	5

Total Hours :

L	T	P
45	15	30

WA/RA	SSH/HSH	CS	SA	S	BS
10	45	-	-	-	-

Course Description and Objectives:

It is aimed to offer different methods for finding rank of a matrix, solving linear equations using matrices, to compute Eigen values and Eigen vectors, to verify C.H.T and apply it to find power of a matrix. Also, to make the students familiarize with double and triple integrals, to make the student acquainted with the concepts of vector differentiation and integration. To make the student to use different mathematical tools of MATLAB related to above concepts.

Course Outcomes:

The student will be able to:

- carry out the basic operations of matrix algebra.
- use row operations to reduce a matrix to echelon form, normal form.
- determine consistency of a system linear equations.
- compute eigen values and eigen vectors.
- evaluate double integrals and triple integrals.
- evaluate double integrals in polar coordinates.
- utilize Cartesian and polar coordinates to find area.
- understand the concept of gradient, divergance and curl.
- apply vector integral theorems in finding surface and volume integrals.

SKILLS:

- ✓ *Appreciate various methods to find the rank of a matrix.*
- ✓ *Solve given system of linear equations.*
- ✓ *Compute Eigen values and Eigen vectors of a matrix.*
- ✓ *Compute the power of a matrix by suitable method.*
- ✓ *Evaluate Multiple integrals.*
- ✓ *Evaluate surface and volume integrals through vector integral theorems.*

UNIT - 1 **L-9, T-3**

RANK OF MATRIX AND LINEAR EQUATIONS: Rank of a matrix, Normal form, Triangular form, Echelon from, Consistency of system of linear equations, Gauss-Jordan method, Gauss elimination method, Gauss-Siedal method.

UNIT - 2 **L-9, T-3**

EIGEN VALUES AND EIGEN VECTORS: Eigen values, Eigen vectors, Properties (without proofs), Cayley-Hamilton theorem (without proof), Power of a matrix, Diagonalisation of a matrix.

UNIT - 3 **L-9, T-3**

MULTIPLE INTEGRALS: Double integrals, Evaluation, Evaluation in polar coordinates, Change of order of integration, Change of variables, Applications to area in cartesian coordinates and polar coordinates, Triple integrals, Fundamentals, Evaluation of triple integrals.

UNIT - 4 **L-9, T-3**

VECTOR DIFFERENTIATION: Vector function, Differentiation, Scalar and vector point function, Gradient, Normal, Divergence, Directional derivative, Curl, Vector identities.

UNIT - 5 **L-9, T-3**

VECTOR INTEGRATION: Line integral, Surface integral, Volume integral, Green's theorem, Stoke's theorem, Gauss theorem of divesergence (without proofs).

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours-30

1. Matrix Algebra.
2. Rank of a matrix.
3. System of equations (Direct method).
4. System of equations (Cramer's Rule).
5. System of equations (matrix inversion method).
6. Eigen values and Eigen vectors of a matrix.
7. Powers of matrix & Cayley-Hamilton Theorem.
8. Vector algebra.
9. Gradient.
10. Divergence.
11. Curl.
12. Multiple Integrals (Area etc).
13. Interpolation.

TEXT BOOKS:

1. H. K. Dass and Er. Rajanish Verma, "Higher Engineering Mathematics", 3rd edition, S. Chand & Co., 2014.
2. B. S. Grewal, "Higher Engineering Mathematics", Khanna Publishers, 44th edition, 2014.
3. Rudra Pratap, "Getting started with Matlab", Oxford University Press, 2009.

REFERENCE BOOKS:

1. Srimanta Pal and Subodh C. Bhunia, "Engineering Mathematics", Oxford Publications, 2015.
2. B. V. Ramana, "Advanced Engineering Mathematics", 25th reprint, McGraw Hill Education, 2015.

4. Erwin Kreyszig, "Advanced Engineering Mathematics", 8th edition, John Wiley & Sons (Asia) Pvt. Ltd., 2001.

ACTIVITIES:

- *Differentiate the methods to find the rank of a matrix.*
- *Solve given system of linear equations and compare with MATLAB output.*
- *Compute Eigen values and Eigen vectors of a matrix and compare with MATLAB output.*
- *Compute the power of a matrix by suitable method.*
- *Evaluate multiple integrals and compare with MATLAB output.*
- *Evaluate surface and volume integrals through vector integral theorems.*

16HS107 ENGINEERING CHEMISTRY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	20	45	-	10	-	-

Course Description and Objectives:

This course aims to develop fundamental knowledge on new engineering materials and their significance in science and engineering applications. In addition, characterization of materials using basic and advanced experimental techniques is also offered. Besides, analysis of water sample and treatment method for domestic, commercial and industrial applications are also covered.

Course Outcomes:

The student will be able to:

- understand the limitations of using hard water for domestic and industrial purposes.
- choose and apply suitable methods to soften the hard water for industrial and domestic applications.
- understand electrochemistry and its importance for applications such as fuel cells, modern lithium ion batteries etc.
- understand the types of corrosion and their implications followed by their control and prevention methods.
- familiarize the preparation, properties and applications of various polymers.

SKILLS:

✓ *Analyse the total hardness of water sample.*

✓ *Understand the basic principles involved in various batteries.*

✓ *Understand the mechanisms of corrosion and various controlling methods.*

✓ *Synthesize various polymers.*

✓ *Identify the functional groups present in chemical compounds using Infrared and Ultraviolet instruments.*

UNIT - 1 **L-9**

WATER TECHNOLOGY: Introduction, WHO, BIS standards of water, Hardness of water, Determination of hardness by EDTA (Numerical Problems), Disadvantages of hard water, Scales and sludges, Caustic embrittlement, Boiler corrosion, Priming and foaming, Softening methods - Zeolite process, Ion Exchange process; Desalination of brackish water - Reverse osmosis, Electrodialysis.

UNIT - 2 **L-9**

ELECTRO CHEMISTRY: Electrode potential, Electrochemical series, Nernst equation, Reference electrodes, Calomel and standard hydrogen electrode, Ion selective electrode, Glass electrode, Determination of pH using glass electrode; Primary cell, Secondary cell - Lead-acid storage cell, Lithium ion battery; Fuel cells - Hydrogen oxygen, Methanol oxygen.

UNIT - 3 **L-9**

SCIENCE OF CORROSION: Introduction, Dry corrosion, Wet corrosion, Mechanisms of wet corrosion, Bimetallic corrosion, Concentration cell corrosion, Factors influencing the rate of corrosion; Corrosion control methods - Cathodic protection, Electroplating, Electrolessplating, Corrosion inhibitors.

UNIT - 4 **L-9**

POLYMERS: Introduction, Types of polymerization - Preparation, Properties and applications of polyethylene, PVC, Teflon, Bakelite, Urea formaldehyde, Silicones; Rubber, Vulcanization, Synthetic rubbers - Buna-S, Buna-N, Neoprene; Introduction to conducting polymers; Poly thiophene.

UNIT - 5 **L-9**

INSTRUMENTAL TECHNIQUES: Interaction of radiation with matter, UV-Visible spectroscopy - Beer, Lambert's law, Qualitative and quantitative analysis, Block diagram of UV-Visible spectrophotometer, IR spectroscopy - Types of vibrations, Block diagram of IR spectrophotometer.

TEXT BOOKS:

1. P.C Jain and Monica Jain, "Engineering Chemistry", 17th edition, Dhanpat Rai Publications, 2010.
2. Shashi Chavala, "A Text book of Engineering Chemistry Engineering Materials and Applications", 3rd edition, Dhanpat Rai Publications, 2015.

REFERENCE BOOKS:

1. K.S. Maheswaramma and Mridula chugh, "Engineering Chemistry", 1st edition, Pearson publication, 2015.
2. M.R. Senapati, "Advanced Engineering Chemistry", 2nd edition, Lakshmi Publications, 2006.
3. H. W. Wilard and Demerit, "Instrumental methods of Analysis", 7th edition, CBS Publications,1986.
4. Gurudeep Raj and Chatwal Anand, "Instrumental Methods of Analysis", 5th edition, Himalaya Publications, 2007.

ACTIVITIES:

- *Collect water samples from different villages near VFSTR University and determine the total hardness, and total alkalinity.*
- *Present the water analysis report to the villagers and suggest proper measures to be taken.*
- *Measure the rate of corrosion of iron objects by weight loss method.*
- *Identify some of the functional groups like carboxylicacid, aldehyde and ketones by I.R. Spectroscopy.*
- *Collect water sample from different villages and estimate the fluoride present in the raw water and suggest some steps for the removal of fluoride.*

16ME101 ENGINEERING GRAPHICS

Hours Per Week :

L	T	P	C
1	-	3	3

Total Hours :

L	T	P
15		45

WA/RA	SSH/HSH	CS	SA	S	BS
6	15	-	5	-	-

Course Description and Objectives:

The main aim of this course is to familiarize the students with the conventional concepts of engineering drawing and computer aided applications in various fields. Engineering graphics is an "International language of Engineers". It is the most effective method of communicating technical ideas in a 2D and 3D format.

Course Outcomes:

The student will be able to:

- sketch engineering objects in the freehand mode.
- create geometric construction with hand tools.
- create dimensions of objects.
- prepare plan and elevation of any pictorial view.
- draw freehand lettering.
- make isometric sketches using graphics.
- draw orthographic multi-view sketches using graphics.

SKILLS:

✓ *Draw free hand sketches, layouts, circuit diagrams, plan and elevations.*

✓ *Draw geometrical objects like polygons, solids of different types.*

✓ *Visualize the objects in real time situations.*

✓ *Develop 3D views (isometric views).*

UNIT - 1 **L-3, P-10**

INTRODUCTION TO ENGINEERING DRAWING: Types of lines, Lettering, Dimensioning, Construction of polygon and conics (Ellipse, Parabola and Hyperbola by general method), Ellipse by oblong method.

UNIT - 2 **L-3, P-8**

ORTHOGRAPHIC PROJECTIONS: Principle of projection, Planes of projections, Projections of points, Projection of straight lines, Inclined to one plane and both the planes, Projections of planes, Simple planes, Planes inclined to one reference planes.

UNIT - 3 **L-3, P-8**

PROJECTIONS OF SOLIDS: Projections of prisms, Pyramids, Cylinders, Cones, Solid axis inclined to one plane.

UNIT - 4 **L-3, P-10**

AUTOCAD: Introduction to AutoCAD

ISOMETRIC VIEWS: Isometric drawing of simple objects, Isometric view of prisms, Pyramids, Cone and cylinder, Simple orthographic views into isometric views through AutoCAD.

UNIT - 5 **L-3, P-9**

ORTHOGRAPHIC VIEWS: Conversion of pictorial views into orthographic views through AutoCAD.

TEXT BOOKS:

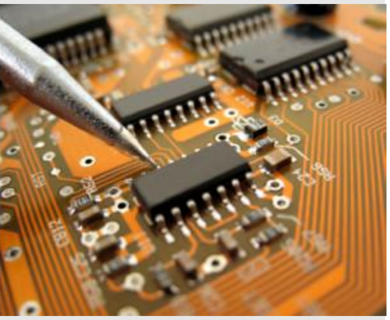
1. N.D.Bhatt, “Engineering Drawing”, 53rd edition, Charotar Publication, 2014.
2. Basant Agrawal , C.M.Agrawal “Engineering Drawing” , 2nd edition., Tata McGraw Hill,2014.

REFERENCE BOOKS:

1. J. hole, “Engineering Drawing”, 2nd edition, Tata McGraw Hill, 2008.
2. K.L. Narayana, “Engineering drawing”, 2nd edition, Scitech Publications, 2008.

ACTIVITIES:

- *Draw line diagram of different machineries.*
- *Draw plan and elevations of buildings and engineering products.*
- *Understand, visualize 3-D components/ products and develop drawings.*
- *Draw different curves used in several engineering applications such as bridges, dams etc.*



16EE102 BASICS OF ELECTRICAL AND ELECTRONICS ENGINEERING

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	5

Course Description and Objectives:

This course provides an in-sight into the functioning of basic electrical components like resistor, inductor and capacitor. It deals with the constructional and operational details of both D.C & A.C machines. It also deals with the basic electronic components like P-N Junction Diode, Zener diode, Transistor and their characteristics.

Course Outcomes:

The student will be able to:

- understand the notation and usage of components in electric circuits.
- analyze AC (single and three phase) and DC, AC circuits using different methods and laws.
- operate various electrical machines.
- understand the concepts of semiconductor devices and their operation.

SKILLS:

✓ *Distinguish between linear and nonlinear elements by looking at VI characteristics.*

✓ *Develop a simple loop generator.*

✓ *Design a voltage regulator using Zener diode.*

✓ *Design a half wave rectifier using PN junction diode.*

✓ *Design a full wave rectifier using PN junction diodes.*

UNIT – 1 **L-9**

FUNDAMENTALS OF DC CIRCUITS: Circuit concepts, Concepts of network, Active and passive elements, Voltage and current sources, Concept of linearity and linear network, Unilateral and bilateral elements, R, L and C as linear elements, Ohm's Law, Kirchhoff's Laws - Application to simple series, Parallel circuits, Mesh and nodal analysis of simple resistive circuits (Simple numerical problems).

UNIT – 2 **L-9**

FUNDAMENTALS OF A.C. CIRCUITS: Generation of A.C. voltage - Frequency, Average value, R.M.S. value, Form factor, Peak factor for sinusoidal only, Phasor representation of alternating quantities, Analysis of simple series and parallel A.C. circuits (simple numerical problems).

BALANCED THREE PHASE SYSTEMS: Relation between phase and line quantities of voltages and currents in star and delta connected systems (Elementary treatment only).

UNIT – 3 **L-9**

FUNDAMENTALS OF ELECTROMAGNETISM: Concepts of Magneto motive force, Reluctance, Flux and flux density, Concept of self Inductance and mutual Inductance, Coefficient of coupling (only elementary treatment and Simple numerical problems).

TRANSFORMERS: Principle of operation of single phase transformer, Constructional features, EMF equation (simple numerical problems).

UNIT – 4 **L-9**

DC MACHINES: Constructional details of a D.C. Machine, D.C. Generator, Principle of operation, EMF equation, Types of D.C. generators (simple numerical problems), D.C. Motor, Principle of operation, Torque equation, Types of D.C. motors (simple numerical problems).

A.C MACHINES: Principle of operation of three phase induction motors, Slip ring and squirrel cage motors, Torque equation, Constructional details of synchronous machine.

UNIT – 5 **L-9**

SEMICONDUCTOR DEVICES: Classification of solids based on energy band theory, Intrinsic and Extrinsic semiconductors, P-type and N-type semiconductors, P-N junction diode and its characteristics, Half and Full wave rectifiers, Zener diode and its characteristics, Voltage regulator, Bi polar junction transistor, Operation, Types, Applications.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- apply the ohm's law, KVL and KCL laws to different circuits.
- calculate the power and energy in electric circuits.
- operate and find the transformation ratio of transformer at different loads.
- study and verify the characteristics of semiconductor devices.
- calculate the efficiency of both HWR and FWR.

LIST OF EXPERIMENTS Total hours-30

ACTIVITIES:

- *Decoding the value of resistors.*
- *Design and fabricate a simple loop permanent magnet generator.*
- *Design and fabricate a simple air cored transformer.*
- *Fabricate full and half wave rectifiers using PN junction diodes.*
- *Fabricate a voltage regulator using Zener diode.*

1. Verification of Ohm's law.
2. Verification of Kirchhoff's current law.
3. Verification of Kirchhoff's voltage law.
4. Measurement of Energy in single phase resistive load circuit.
5. Measurement of Power in single phase resistive load circuit.
6. Transformation ratio of a single phase transformer at different loads.
7. Verification of PN junction diode characteristics under both forward and reverse bias.
8. Verification of Zener diode characteristics under both forward and reverse bias.
9. Implementation of Half Wave Rectifier without filter.
10. Implementation of Full Wave Rectifier without filter.

TEXT BOOKS:

16HS111 ENGINEERING CHEMISTRY LABORATORY

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	45

Course description and Objectives:

This course is aimed at enlightening the importance of theoretical concepts of chemistry and experimental techniques for characterization of materials.

Course Outcomes:

The student will be able to:

- analyse the total hardness present in water samples.
- determine the total alkalinity of water used in industries.
- acquire the knowledge on polymers used as insulators.
- familiarize advanced techniques in chemical analysis using conductometer and pH meter.

LIST OF EXPERIMENTS

1. Determination of Total Alkalinity of water.
2. Estimation of Total hardness of water.
3. Find the percentage of available chlorine in Bleaching powder.
4. Estimation of Fe (II) by Dichrometry method.
5. Preparation of Phenol - Formaldehyde Resin.
6. Synthesis of Urea- Formaldehyde Resin.
7. Estimation of Concentration of acid by pH metry.
8. Determination of Strength of acid by Conductometry.
9. Measurement of Mn^{+7} by Colorimetry.
10. Determination of concentration of a salt by ion exchange method.
11. Find the concentration of Mn^{+7} and Cr^{+6} by UV-Visible Spectrophotometry.
12. Find the rate of corrosion by weight loss method.

TEXT BOOKS:

1. J.Mendham, R.C.Denney, J.D. Bares, M.Thomas and B.Siva Sankar, “Vogel’s Text book of qualitative Chemical Analysis”, Pearson Publications - Volume I, 2009.

16HS109 ENVIRONMENTAL SCIENCE AND TECHNOLOGY

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
30	-	-	10	20	4	-	4	-

Course Description and Objectives:

Environmental Science and Technology offers technological aspects of environmental science and in maintaining environmental integrity in relation to human development. It helps every engineer to plan appropriate strategies for addressing environmental issues and also contribute to the development of innovative technologies for solving such issues. It produces professionals who will ensure sustainable development of the nation in general and environmental in particular.

Course Outcomes:

The student will be able to:

- observe and integrate the diverse information from sources outside the classroom.
- think critically, creatively, resourcefully and strategically, including identifying steps needed to reach goals, manage projects, evaluate progress, and adapt approaches, developing both self reliance, and civic mindedness.
- adapt eco-friendly technologies in order to maintain hygienic conditions.
- understand the human activities that are detrimental to environment.
- collaborate across diverse disciplines to identify and create solutions that conserve and help maintain biodiversity in the long term.
- discuss the issues involved in the generation of renewable energy resources.

SKILLS:

- ✓ *Understand structural relationships, abstract models, symbolic languages and deductive reasoning.*
- ✓ *Gain perspectives to adrress the challenges, improvise and devise solutions.*
- ✓ *Identify solutions to environment and development issues, using planning, analysis, modeling, and new approaches.*
- ✓ *Acquire fieldwork techniques to study, observe and prepare documents, charts, PPTs, Models etc.*
- ✓ *Understand how natural resources should be used judiciously, to protect biodiversity and maintain ecosystem.*

UNIT - 1 **L-6**

NATURAL RESOURCES: Environmental studies - Definition scope and its importance, Need for public awareness; Natural resources - Forest resources, Deforestation, Water resources, Properties and conflicts, Mineral resources, Extraction and impacts, Food resources, Modern agriculture methods, Fertilizer pesticide problems, Water logging, Salinity, Energy resources, Renewable and non-renewable energy resources, Harness technology, Solar energy technologies, Land resources, Land degradation, Soil erosion; Role of an individual in conservation of natural resources.

UNIT - 2 **L-6**

ECOSYSTEMS AND BIODIVERSITY: Ecosystem - Concept, Structure and functions of an ecosystem, Food chains, Food webs, Ecological pyramids, Energy flow, Energy regulation, Succession, Biogeochemical cycles, Aquatic ecosystems; Biodiversity - Introduction, Bio-geographical classification, Values of biodiversity, Biodiversity at global, National and local levels, Hot-spots of biodiversity, Threats to biodiversity, Endangered and endemic species of India, Conservation of biodiversity.

UNIT - 3 **L-6**

WASTE MANAGEMENT AND GREEN TECHNOLOGY: Solid waste management - Causes, Effects and control measures of municipal and Industrial wastes; Pollution - Air, Water, Thermal, Soil and noise pollutions, Role of an individual in prevention of pollution; Remote sensing / GIS - Introduction, definitions, Applications of the remote sensing; Innovative practices - Objectives, Innovative practices in agriculture and forest community, Bio-villages; Green technology for sustainable development; Life cycle assessment and its concept.

UNIT - 4 **L-6**

SOCIAL ISSUES AND EIA: Sustainable development, Water conservation, Cloud seeding, Rainwater harvesting methods watershed management, Global warming, Acid rain, Ozone layer depletion, Environmental legislation - Wildlife protection act, Water act, Forest conservation act, Air act, Environmental protection act; Environmental Impact Assssment (EIA) - Introduction, Definition of E.I.A and E.I.S, Scope and objectives, Importance of E.I.A in proposed projects / industry / developmental activity.

UNIT - 5 **L-6**

ENVIRONMENTAL SANITATION: Food sanitation - Food and drugs Act, Food preservations, Milk sanitation, Tests for milk, Pasteurization of the milk; Water, Air, Soil and food borne diseases, Maintenance of sanitary and hygienic conditions; Role of youth in the development, Promoting activities, Youth as initiators, Field work/environmental visit - Visit to a local area to document environmental assets river/ forest/ grassland / hill /mountain, Study of local environment, Common plants, Insects, Birds; Study of simple ecosystems - Pond, River, Hill slopes etc., Visit to industries/water treatment plants/effluent treatment plants.

TEXT BOOKS:

1. Anubha Kaushik and CP Kaushik, "Perspectives in Environmental Studies", 5th edition, 2016
2. Benny Joseph, "Environmental studies", 2nd edition, McGraw Hill Education, 2015.

REFERENCE BOOKS:

1. Dr. M. Chandrasekhar, "A Text book of Environmental Studies", HI-TECH publications, 2006.
2. Dr. M. Anji Reddy, "A Text book of environmental science and Technology", B S Publications, 2008.
3. Dr. K. Mukkanti, "A Text book of Environmental Studies", S.CHAND and Company Ltd, 2009.
4. EHILRS and ST, "Text book of Municipal and Rural Sanitation", M.S Hill, 1998.

7. Kurian Joseph and R.Nagendram, "Essentials of environmental studies", Pearson Education Pt Ltd, Delhi, 2007.

ACTIVITIES:

- *Painting contests on environmental issues and themes.*
- *Models of energy resources, Pollution and Solid Waste Management-3R strategy.*
- *Quiz competition.*
- *Essay writing competition.*
- *Skit, JAM and debate.*
- *Field work and documentation.*
- *Assignments.*

16ME103 WORKSHOP PRACTICE

Hours Per Week :

L	T	P	C
-	-	3	2

Total Hours :

L	T	P
-	-	45

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	20	-	-

Course Description and Objectives :

This course is aimed to impart knowledge and provide hands-on experience in Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring. In addition it also provides knowledge on various manufacturing processes such as Foundary, Welding, Machine Shops and CNC Machines.

Course Outcomes :

The student will be able to:

- identify various tools connected to the trades such as Carpentry, Fitting, Tinsmithy, Blacksmithy and House wiring.
- fabrication of wooden joints and understand joining of metals.
- make metal joints and sheet metal work.
- make metal tools like knives, needles, swords, arrows etc.

SKILLS:

- ✓ *Prepare wooden and metal furniture.*
- ✓ *Electrical wiring and power supply in residences.*
- ✓ *Make funnels, trays, locker, steel almirahs etc.*
- ✓ *Fabrication of various agriculture tools, hooks, axes, axels, rims etc.*
- ✓ *CNC machines and various machining operations and processes.*

EXERCISES IN THE FOLLOWING TRADES :

1. Carpentry.
2. Fitting.
3. Tin smithy and Black smithy.
4. House wiring.
5. Foundry and welding (Demonstration).
6. Machine shop and CNC (Demonstration).

Note: In each trade, the student has to perform at least two jobs.

TEXT BOOKS:

1. S.K. Hazra Choudhury, “Elements of workshop Technology”, 11th edition, Media Promoters, 1997.
2. Gopal, T.V., Kumar, T., and Murali, G., “A first course on workshop practice: Theory, Practice and Work Book”, Suma Publications, Chennai, 2005.
3. Venkatachalapathy, V. S, “First year Engineering Workshop Practice”, Ramalinga Publications, Madurai, 1999.

ACTIVITIES:

- *To make wooden joints like Mortise and Tenon joint, T-lap Joint which are used to prepare a wooden furniture.*
- *To prepare metal joints and metal sheet products like V-Joint and trays by using mild steel flats and Galvonised iron sheets.*
- *Trials on electrical circuit connections.*

16PL102 BASICS OF PETROLEUM ENGINEERING

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	15	-	7	45	3	10	-	-

Course Description and Objectives:

This course provides a general introduction to the field of petroleum engineering. The objective of this course is to provide basic understanding on the fundamentals of petroleum engineering and also to provide knowledge of production operations in the oil and gas wells.

Course Outcomes:

The student will be able to:

- demonstrate knowledge in the fundamentals of various petroleum engineering courses like reservoir engineering, well drilling technology, heat, mass transfer etc.
- understand various drilling operations in petroleum production.
- understand various methods of transportation of petroleum.

SKILLS:

- ✓ *Demonstrate basic knowledge in the fundamental of petroleum engineering.*
- ✓ *Identify common equipments used in petroleum production and refining operations.*
- ✓ *Demonstrate basic knowledge in petroleum composition and refining.*
- ✓ *Demonstrate basic knowledge in well drilling and completion technology.*

UNIT - I **L-9, T-3**

NATURE OF PETROLEUM : Composition & properties. Concepts of Petroleum Geology & Basic Rock Properties –source, migration & accumulation of petroleum. Porosity, permeability and rock pressure concepts of rocks.

UNIT - II **L-9, T-3**

PETROLEUM EXPLORATION METHODS : Geological & geophysical. Drilling: Brief history, various techniques of drilling. Drilling tools & equipment. Various types of rigs, Concepts of Well Logging & Formation Evlauation Techniques.

UNIT - III **L-9, T-3**

CONCEPTS OF DRILLING FLUIDS AND CEMENTING : Composition and properties of drilling fluids. Types of Tubing and Casing, Types of Cement and Cementing Practice's..

UNIT - IV **L-9, T-3**

WELL COMPLETIONS : Types, perforation techniques, Corning Needs and core analysis. Drill Stem Testing (DST).
Production of Oil: Basic concepts of Production, gathering, treatment, storage.

UNIT - V **L-9, T-3**

PETROLEUM REFINING AND TRANSPORTATION : Concept of Refining, Gas Processing & Petrochemicals.
Tank-Trucks and Rail Transportation: Oceanic Tanker Transportation, Inland Water, Coastal and Oceanic, Tanker Size, Power, Cargo Sapce, Marine Storage Terminals, Shore Installatio, Line Specifications, Plastic Pipes.

TEXT BOOKS:

1. Howard, "Oil & Gas Production Handbook", ABB Publisher, Edition 3, August 2013.
2. Carl Gatlin, "Petroleum Engineering Drilling & Welling completion", Prentice Hall Inc, 2006.

REFERENCE BOOKS:

1. David A.T. Donobue, Karl R.Lang, "A First Course in Petroleum Technology", Prentice Hall PTR, 1986.
2. D. R.Skinner, "Introduction to Petroleum production Vol. I,II,II", Gulf Publishing Co, 1981.
3. Donlad L. Katz, "Natural Gas Engineering (Hand Book)", Mc Graw Hill, Singapore, 1956.

ACTIVITIES:

- *Case study on identification of rocks and calculations of rock properties.*
- *Case study on types of drilling and drilling fluids.*

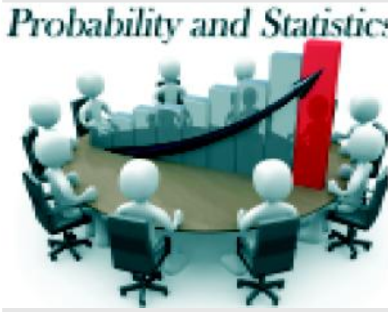
16HS202 PROBABILITY AND STATISTICS



Hours Per Week :

L	T	P	C
4	-	-	4

Total Hours :

L	T	P
60	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	35	-	10	2	-

Course Description and Objectives:

This course deals with descriptive statistics, correlation and regression and their applications, probability, theoritical distributions and testing of hypothesis.

The objective of this course is to enable the student to understand and apply statitical techniques, curve fitting, correlation and regression, probability and also to make the student familiar with discrete, continuous distributions and testing of hypothesis.

Course Outcomes:

The student will be able to:

- distinguish between quantitative and categorical data and represent the data in graphical and tabular forms.
- calculate and interpret measures for the centre and spread of a data set.
- decide how and when to use the normal model.
- calculate and interpret correlation coefficient and regression lines.
- understand the rules of probability and apply them.
- compute probabilities using theoritical distributions.
- test hypothesis for population parameters.

UNIT - 1 **L-9**

STATISTICS : Basic definitions, Frequencies, Graphical representation, Histogram, Ogive curves, Measures of central tendency, Arithmetic mean, Median, Mode, Mean deviation, Standard deviation, Symmetry and skewness, Karl Pearson's coefficient of skewness.

UNIT - 2 **L-9**

CURVE FITTING, CORRELATION & REGRESSION : Least squares method, Curve fitting (straight line and parabola only). Covariance, Correlation, Types, Pearson's coefficient of correlation, Rank correlation, Spearman's rank correlation. Regression, Regression lines.

UNIT - 3 **L-8**

PROBABILITY : Introduction, Definition (classical and axiomatic approach), Addition theorem, Conditional probability, Multiplication theorem, Total probability, Bayes theorem.

UNIT - 4 **L-8**

DISTRIBUTIONS: Random variables, Discrete and continuous variables, Introduction to distributions.

BINOMIAL DISTRIBUTION : Definition, Mean and Standard deviation, Recurrence relation, Applications, Fitting of binomial distribution.

POISSON DISTRIBUTION : Definition, Mean and standard deviation, Recurrence relation, Poisson Distribution is an approximation of Binomial distribution, Applications, Fitting of Poisson distribution.

NORMAL DISTRIBUTION : Definition, Normal curve, Mean and standard deviation, Median, Mode, Normal distribution applications.

UNIT - 5 **L-12**

SAMPLING METHODS : Population and sampling, Parameters and statistics, Types of sampling~~.~~ Test of hypothesis and test of significance: Null hypothesis, Errors, Level of significance, Confidence Limits, Testing large samples, Sample distribution of proportion~~,~~ T-distribution for small sample, difference between means of small sample, Chi square test for goodness of fit, Chi square test for test of independence.

16EL102 SOFT SKILLS LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P
-	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The Soft Skills Laboratory course is aimed at training undergraduate students on employability skills. Designed to impart work related skills, the course will enable trainees to develop interpersonal communication, leadership, Preparing Resume, Group Discussion, and Interview Skills. It will give them the required competence and confidence to handle professional tasks.

Course Outcomes:

The student will be able to:

- equip with requisite professional and inter-personal skills.
- possess the ability to think critically on issues for informed decision making and know how to communicate effectively, through choice of appropriate language and speech, while dealing with others at the workplace.
- identify and introspect on individual strengths and weaknesses, will emerge with improved levels of self-awareness and self-worth, for greater efficacy at workplace.

SKILLS:

- ✓ *Communicate and understand the difference between soft skills and hard skills.*
- ✓ *Learn professionalism and Employability skills.*
- ✓ *Plan Career by drawing their SWOT, Setting the Goal, learn the importance of Time and Stress Management.*
- ✓ *Learn Vocabulary, Situational English, Group Discussion, Reading Comprehension and Listening Comprehension which are essential for all competitive examinations.*
- ✓ *Prepare Resume and learn how to face interview.*
- ✓ *Learn Gender sensitive language, Good manners, emotional intelligence and essential skills.*

ACTIVITIES:

- *Formal and informal communication.*
- *SWOT analysis.*
- *Stephen covey Time Management matrix.*
- *Stress Management techniques.*
- *Vocabulary flash cards.*
- *Situational Dialogues.*
- *Group Discussion.*
- *Resume preparation.*
- *Mock Interview.*
- *Reading comprehension activities.*
- *Listening comprehension Activity by watching the American accent video.*
- *Emotional intelligence, etiquette quiz.*

UNIT - 1 **P-8**

A) COMMUNICATION : Need for effective communication - The process of communication, Levels of communication, Flow of communication, Choice of diction and style with reference to setting (formal, semi-formal or informal); Communication networks, Barriers to communication, Miscommunication, Noise and ways to overcome the barriers.

B) SOFT SKILLS: Difference between soft and hard skills, Need for soft skills, Professionalism, Employability skills.

C) CAREER PLANNING: Job vs career, Goal setting, SWOT analysis, Planning and prioritization, Four quadrant time management system, Self-management, Stress-management.

ACTIVITY : Johari Window for SWOT analysis, Setting a SMART goal using the provided grid, Writing a statement of purpose (SOP).

UNIT - 2 **P-8**

A) VOCABULARY BUILDING: Word etymology, Roots, Prefixes and suffixes, Synonyms and antonyms, Collocations, One-word substitutes, Analogies, Idioms and phrases, Contextual guessing of unfamiliar words, Task-oriented learning (50 words).

ACTIVITY: Making a flash card (one per day by each student), Vocabulary exercises with hand-outs, Vocabulary quiz (evaluation will be a combination of the 50 words provided by the instructor and the flash cards made by the student (one per day).

B) FUNCTIONAL ENGLISH : Situational dialogues, Role plays (including small talk), Self introduction, Opening and closing a telephonic conversation, Making an appointment, Making a query, Offering/ Passing on information, Communicating with superiors, Expressing agreement/objection, Opening bank account (combination of prepared and impromptu situations given to each student).

C) GROUP DISCUSSION : Articulation and flow of oral presentation, Dynamics of group discussion, Intervention,Summarizing and conclusion, Voice modulation, Content generation, Key word approach (KWA), Social, Political, Economic, Legal and technical approach (SPELT), View point of affected part (VAP), Language relevance, Fluency and coherence.

ACTIVITY : Viewing a recorded video of GD and Mock sessions on different types of GD topics - Controversial, Knowledge, Case study (including topics on current affairs).

UNIT - 3 **P-4**

A) RESUME-WRITING : Structure and presentation, Defining career objective, Projecting one's strengths and skill-sets, Summarizing, Formats and styles and covering letter.

ACTIVITY : Appraising some samples of good and bad resumes, Preparing the resume, Writing an effective covering letter.

B) FACING INTERVIEWS : Interview process, Understanding employer expectations, Pre-interview planning, Opening strategies, Impressive self-introduction, Answering strategies, Other critical aspects such as body language, Grooming, Other types of interviews such as stress-based interviews, Tele-interviews, Video interviews, Frequently asked questions (FAQs) including behavioural and HR questions and the aspect looked at by corporate during interviews.

ACTIVITY: Writing responses and practicing through role plays and mock interviews on the FAQs including feedback.

UNIT - 4 **P-4**

A) READING COMPREHENSION : Reading as a skill, Techniques for speed reading, Understanding the tone, Skimming and scanning, Appreciating stylistics, Impediments for speed reading, Eye fixation, Sub-vocalization, Critical reading, Reading based on purpose, Reading for information, Reading for inference.

ACTIVITY : Reading comprehension exercises with texts drawn from diverse subject areas (Hand-outs), Newspaper activity with students divided into 4 groups, Each group looks at critical component of communication such as Listening, Speaking, Reading and writing enabling them to be better communicators as well as be more aware about the current affairs, Which help in group discussion.

B) LISTENING COMPREHENSION : Listening as a skill, Different types of listening, Active and passive listening, Top-down approach, Bottom-up approach, Understanding the non verbal cues of communication, Intonation and stress.

ACTIVITY : Narration of a story, Speech excerpts with different accents (Indian, British, American), listening comprehension exercises with audio and video excerpts.

UNIT - 5 **P-6**

IMPACT OF LANGUAGE ON PERSONALITY : Gender sensitive language in MNCs, Cultural sensitivity, Social awareness, Emotional intelligence, Good manners, Self-grooming, Positive body language, Accepting and handling responsibility, Assertiveness, Problem solving, Negotiating skills, Networking and creating a good first impression, Seven essential skills for a team player, Attentive listening, Intelligent questioning, Gently persuading, Respecting other's views, Assisting others, Sharing, Participating actively.

ACTIVITY : Johari Window, Games and case studies.

16PL201 FUNDAMENTALS OF GEOLOGY

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
5	40	-	8	5	-

Course Description and Objectives:

This basic course in general geology is designed to train the students to understand the basics of geology, viz: formation of earth, layers of earth, diverse types of rocks, formation of sedimentary basins and the micro fossils and their relationship to oil and gas.

Course Outcomes:

The student will be able to:

- Discern the dimension of earth structure, composition, origin of earth, formation of earth. It deals essence of scientific studies dealing with the origin, age, structure of the earth and with the evolution, modification, and extinction of various surface and subsurface physical features.
- Understand the land forms as geomorphology, physiography and to gain a better perspective conforming to the present day thinking on the aspects of geology.
- Be impressed by the fact that the subject is not static and will more likely keep his mind open to innovative ideas.

SKILLS:

- Understand the origin of various kinds of igneous, sedimentary, metamorphic rocks that can be understood in terms of their tectonic setting.
- Gain the knowledge on fundamentals of sedimentary basins and paleontology and their significance to the petroleum industry.

UNIT - 1 **L-9**

Dimensions of earth structure, composition & origin of an earth, envelops of the earth- crust, mantle, core Internal dynamic process- Plate tectonics- Continental drift, Earthquake and Volcanoes, External dynamic process- weathering, erosion and deposition.

UNIT - 2 **L-9**

Fundamental concepts in Geomorphology-geomorphic processes distribution of landforms-drainage patterns –development, Landforms in relation to rocks types, paleochannels, buried channels.

UNIT - 3 **L- 9**

Geological work of rivers, wind, ocean, glaciers and the landforms created by them. Identification of different structural features encountered in oil exploration viz: joints, faults, folds, unconformities.

UNIT - 4 **L-9**

Origin of igneous, sedimentary and metamorphic rocks. Sedimentary structures-petrographic character of conglomerate, sandstone, shale, limestones. Introduction to sedimentary basins and deltaic systems; Topographic maps, Thematic maps, Topographic and Thematic profiles.

UNIT - 5 **L-9**

Paleontology: Introduction to Paleontology, Fossils and Fossilization. Micropaleontology - Palynology: Distribution of microfossils-Foraminifera, Radiolaria, Conodonts, Ostracodes, Diatoms; Importance of micro fossils in oil exploration.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours-20

1. Identification of Materials by visual inspection.
2. Identification of minerals in Hand Specimen.
3. Study of common rocks with reference to their structure, mineral composition and uses.
4. Location of observed outcrops on the Top sheet.
5. Measurement of the strike, dip and apparent and true thickness of the outcrops.
6. Preparation of the geological map of the area, structure contour maps and isopach maps for different stratigraphic levels.
7. Preparation of litho stratigraphic columns, litho stratigraphic correlation, geological cross sections.

ACTIVITIES:

- *Case study on identification of rocks.*
- *Minor Projects on geological graphs.*

8. Preparation of structural contour map and location of Oil Water Contact (OWC).

9. Study of physical properties of minerals.

10. Geological mapping and traversing.

11. Field Visit-I.

12. Field Visit-II.

TEXT BOOK:

16PL203 PETROLEUM GEOLOGY

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
8	60	-	10	-	-

Course Description and Objectives:

This is a basic course in petroleum geology. The students will be exposed to different source, reservoir and cap-rocks, characterization of reservoir rocks, classification of reservoir pore space, permeability, migration and entrapment, temperature-pressure conditions for the generation of oil and gas from sediments.

Course Outcomes:

The student will be able to:

- Identify different source rocks from which hydrocarbons are generated.

SKILLS:

- Discern about origin of source rocks, formation of good source rocks, different characterization of reservoir rocks, classification, nomenclature and different source of reservoir rocks, pore space, porosity and its types

- Gain knowledge of how and why fluid hydrocarbons migrate from a source rock to reservoir rock, entrapment and accumulation of hydrocarbons

ACTIVITY:

- Do tectonic classification, stratigraphy evaluation and hydrocarbon accumulation of KG basin, Cambay basin and Mumbai off-shore.

UNIT - I **L-9, T-3**

Source Rocks: Definition of source rock, Organic rich sediments as source rocks, Nature and typeof source rocks - Claystone / shale, The process of diagenesis, catagenesis and metagenesis in the formation of source rocks, Evaluation of petroleum source rock potential, Limestone as source rocks, Subsurface pressure temperature conditions for the generation of oil and gas from the source sediments, Oil window.

UNIT - 2 **L-9, T-3**

Reservoir Rocks: Characteristics of Reservoir rocks, Classification and nomenclature: ClasticReservoir Rocks, Carbonate Reservoir Rocks, Unconventional, Fractured and Miscella-neous reservoir rocks, Marine and non-marine reservoir rocks, Concept of Shale oil.Reservoir pore space, porosity- primary and secondaryporosity, effective porosity, fracture porosity - permeability – effective and relative permeability relationship between porosity, permeability and texture. Cap rocks: Definition and characteristics of cap rocks.

UNIT - 3 **L-9, T-3**

Hydrocarbon migration: Geological framework of migration and accumulation, The concept ofhydrocarbon migration from source beds to the carrier beds, Carrier beds to the reservoir, Free-path ways for migration, Short distance and long distance migration, Evidence for migration, Oil and gas seepages.

UNIT - 4 **L-9, T-3**

Entrapment of hydrocarbons: Entrapment and accumulation of hydrocarbons, Classification andtypes of traps: Structural, stratigraphic and combination type of traps, Traps associated with salt domes.

UNIT - 5 **L-9, T-3**

Sedimentary Basins: Sedimentary basins -origin and classification, Types of basins and theirrelationship to hydrocarbon prospects, Tectonic classification, stratigraphic evolution and hydrocarbon accumulations of the following basins: Krishna-Godavari basin, Cambay basin and Mumbai off-shore.

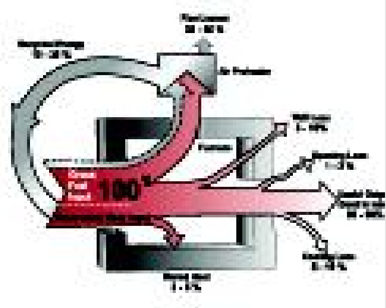
TEXT BOOK:

1. Geology of Petroleum, A.I. Levorsen, 2nd Edition. CBS, Publishers, 2006.

REFERENCE BOOKS:

1. Elements of Petroleum Geology, Richard, C. Selley, Elsevier, 1997
2. Sedimentary basins of India- ONGC bulleting.
3. Unconventional Petroleum Geology, Caineng Zou et al., Elsevier, 2013.

16CH201 CHEMICAL PROCESS CALCULATIONS



Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	50	-	5	5	5

Course Description and Objectives:

This course deals with fundamentals of material and energy balances involved in chemical processes. The objective of this course is to develop basic understanding pertaining to principles of chemical engineering processes and calculations.

Course Outcomes:

The student will be able to:

- use mole concepts and perform calculations involving concentrations.
- apply gas laws to solve problems related to ideal gas mixtures.
- carry out detailed material and energy balance for any chemical plant having different unit operations and unit processes.

SKILLS:

- ✓ *Material balance calculations for different chemical processes.*
- ✓ *Energy balance for any chemical plant.*

ACTIVITIES:

- o *Mini project on material and energy balance of a chemical process.*
- o *Estimation of physical properties.*

UNIT - 1 **L-9, T-3**

STOICHIOMETRIC RELATIONS : Basis of calculations, Methods of expressing composition of mixtures and solutions, Mole fraction and mole percent, Density and specific gravity, Baume and API gravity scales.

BEHAVIOR OF IDEAL GASES : Kinetic theory of gases, Application of ideal gas law, Gaseous mixtures, Gases in chemical reactions, Gas densities and specific gravities.

UNIT - 2 **L-9, T-3**

VAPOR PRESSURE : Liquefaction and liquid state, Vaporization, Boiling point, Effect of temperature on vapor pressure, Antonie equation, Vapor pressure plots, Vapor pressure of immiscible liquids and ideal solutions, Raoult's law, Non-volatile solutes, Basics of humidification.

UNIT - 3 **L-9, T-3**

MATERIAL BALANCE : Materials balance without reaction, Materials balance with reaction–recycle, purge, bypass.

UNIT - 4 **L-9, T-3**

THERMO PHYSICS : Energy, Energy balances, Heat capacity of gases, Liquid and mixture solutions, Kopp's rule, Latent heats, Heat of fusion and heat of vaporization, Trouton's rule, Kistyakowsky equation for non-polar liquids, Enthalpy and its evaluations.

UNIT - 5 **L-9, T-3**

THERMO CHEMISTRY : Calculation and applications of heat of reaction, Combustion and formation, Kirchoff's equation, Calculation of theoretical and actual flame temperatures, Combustion calculations.

TEXT BOOKS:

16CH202 MOMENTUM TRANSFER

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	20

WA/RA	SSH/HSH	CS	SA	S	BS
20	45	-	5	5	5

Course Description and Objectives:

This course deals with fundamentals of fluid flow and its application to chemical process industries including pipe flow, fluid machinery. The objective of this course is to familiarize students with basic concepts of fluid statics, fluid dynamics, compressible and incompressible fluids, fluidization, transportation and metering of fluids.

Course Outcomes:

The student will be able to:

- understand basic principles of fluid mechanics.
- analyze fluid flow problems with the application of the momentum and energy equations.
- analyze pipe flows as well as fluid machinery.

SKILLS:

✓ *Application of fluid mechanics concepts to solve real life problems.*

✓ *Estimate* physical properties of fluids in motion and at rest.

✓ *Measurement of flowing fluids.*

✓ *Selection of pumps for engineering applications.*

ACTIVITIES:

- *Calibration of rotameter.*
- *Separation of immiscible liquids using decanter.*
- *Calibration of manometer.*
- *Design of Venturi meter.*
- *Design of Orifice meter.*

UNIT - 1 **L-10**

DEFINITIONS AND PRINCIPLES : Unit operations, Unit systems, Dimensional analysis, Basic concepts. Fluid Statics: Nature of fluids, Hydrostatic equilibrium, Manometers.

FLUID FLOW PHENOMENA : Laminar flow, Shear stress, Viscosity, Turbulence, Eddy viscosity, Flow in boundary layers.

UNIT - 2 **L-9**

BASIC EQUATIONS OF FLUID FLOW : Mass balance, Mass velocity, Momentum balance, Bernoulli equation, Mechanical energy balance equation, Correction factors, Pump work.

UNIT - 3 **L-9**

FLOW OF INCOMPRESSIBLE FLUIDS : Shear stress distribution in pipes, Relation between skin friction parameters, Laminar flow in pipes, Hagen-poiseuille equation, Laminar flow of non-Newtonian liquids, Velocity distribution for turbulent flow, Friction factor chart.

FLOW OF COMPRESSIBLE FLUIDS : Process of compressible flow, flow through variable area conduits, Adiabatic Frictional Flow, Isothermal Frictional Flow.

UNIT - 4 **L-8**

FLOW PAST IMMERSED BODIES : Drag, Drag Coefficient, Stagnation point, Friction in flow through beds of solids, Motion of particles through fluids, Terminal velocity, Motion of spherical particles. Fluidization: Conditions for fluidization, Minimum fluidization velocity.

UNIT - 5 **L-9**

TRANSPORTATION AND METERING OF FLUIDS : Pipes, Fittings, Valves, Joints, Pumps, Developed head and Power requirement in pumps, Suction lift and cavitation, Positive displacement pumps, Centrifugal pumps, Measurement of flowing fluids: Classification of measuring devices, Venturi meter, Orifice meter, Rotameter.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total Hours-30

1. Identification of laminar and turbulent flows.
2. Verification of Bernoulli's Equation.
3. Measurement of flowing fluid using Venturi meter.
4. Measurement of flowing fluid using Orifice meter.
5. Determination of friction loss in fluid flow through pipes.
6. Determination of friction loss in fluid flow through fittings.
7. Determination of pressure drop in packed bed.
8. Determination of pressure drop in fluidized bed.

9. Determination of characteristics of centrifugal pump.

10. Determination of characteristics of reciprocating pump.

TEXT BOOKS:

1. W.L. McCabe, J.C. Smith and P. Harriot, “Unit Operations of Chemical Engineering”, 7th edition, McGraw-Hill, 2005.

2. Chattopadhyay. P, “Unit Operations of Chemical Engineering Vol-1 “, 1st edition, Khanna Publishers, 2012.

REFERENCE BOOKS:

1. C. J. Geankoplis, “Transport Processes and Unit Operations”, 3rd edition, Prentice Hall of India, 1993.

2. A.S. Foust, “Principles of Unit Operations”, 2nd edition, John Wiley & Sons, 1981.

16PL204 SURVEYING AND OFFSHORE STRUCTURES

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	-	-	5	5

Course Description and Objectives:

Demonstrate the principles of surveying for the measurement of distance and angles.Explain the concepts of leveling and contouring. Introduce the concepts of advanced surveying and implementation in shoreline surveying. Demonstrate the principles of sea surveying.Introduce the concepts of wave and current data collection. Explain various stages of fixed offshore structure in view of the operation. Introduce the concept and types of compliant structures.

Course Outcomes:

The Student will be able to:

- The basic principles and significance of measurement of distance and direction.
- Horizontal and vertical angles.
- Shore line survey and basics of acoustics, application in the field.
- The basic principles of floatation and stability of floating structures.
- Stability criteria of neutrally and positively buoyant structures.

SKILLS:

- Principles, importance and measurement of angles using Theodolite.
- Concepts and terminology in contour mapping.
- Measurement and to plotting the contour maps.
- Basics of total station and GPS.

UNIT - 1 **L-9, T-3**

Distance and Direction: Objectives, Principles and classifications of Surveying, chain, tape,Electronic distance measurements, Meriadians Azimuths and Barings, declination, computation of angle.

Theodolite: Theodolite, description, uses and adjustments–temporary, Measurement ofhorizontal and vertical angles, Principles of Electronic Theodolite.

UNIT - 2 **L-9, T-3**

Leveling and Contouring: Concept & Terminology, Temporary-Method of levelling, Characteristics & Uses of contours, Methods of conducting contour surveys and their plotting.

UNIT - 3 **L-9, T-3**

Introduction to Advanced Surveying: Total Station and Global positioning system andDifferential GPS.

Hydrographic surveying: Introduction- Shoreline Surveys- Sounding Methods (Bathymetry).

UNIT - 4 **L-9, T-3**

Subsea surveying and Geomatics, Introduction to the principles of subsea surveying and geomatics is including bathymetry and seismic survey, positioning systems (surface positioning, visual positioning techniques) distance from shore & water depth, Generation of surface waves in oceans, Wave data collection and current data collection.Floating structures, basic hydrostatics, centre of gravity, center of buoyancy, displacement.

UNIT- 5 **L-9, T-3**

Functions of offshore structures, Fixed offshore structures, Types of fixed structures, fabrication, transportation, installation and operation of offshore structures, construction of offshore concrete structures, Definition of compliant structures, Types of complaint structures.

TEXT BOOKS :

1. Surveying (Vol – 1, 2) ; Higher Surveying, Punmia, B.C., Ashok Kumar Jain and Arun Kumar Jain , Vol 3, Laxmi Publications, 2005.
2. Surveying (Vol – 1 & 2), Duggal S K, Tata McGraw Hill, 2004.
3. Text book of Surveying, Venkataramaiah, C., Universities Press, 1996.

REFERENCE BOOKS :

1. Handbook of Offshore Engineering, Subrata K. Chakrabarti, Volume 1, Elsevier, 2005.
2. Ship Stability for Masters and Mates, Barrass, C. B. and D. R. Derret, 7th Edition, Butterworth-Heinemann, 2012.
3. Construction of Marine and Offshore Structure, Gerwick, Jr., C., 3rd Edition, CRC Press, 2007.

ACTIVITY:

- *Case study on measurement of distance and angles.*

16EL103 PROFESSIONAL COMMUNICATION LABORATORY

Hours Per Week :

L	T	P	C
-	-	2	1

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	30	-	-	-	-	-	-

Course Description and Objectives:

The Professional Communication Laboratory course is aimed at improving professional communication skills (LSRW – Listening, Speaking, Reading and Writing) of undergraduate students and preparing them for their profession as engineers and managers. This course will help students to understand professional communication and personality as two interlinked spheres of influence, and provide them with exposure to conventions of corporate communication involved in the functioning of the business world.

Course Outcomes:

The student will be able to:

- be equipped to clear industry recognized certification such as BEC Vantage by the University of Cambridge.
- equip them to stand out both in the professional setting as well as for further pursuits in the academic world.
- since this certification looks at LSRW (Listening, Speaking, Reading and Writing) components in great detail, we hope to equip students to confidently and successfully attempt all the 4 critical components.

SKILLS:

✓ *Understand and use grammar rules in writing; sentences, paragraphs, paraphrasing.*

✓ *Write business emails, memos, letters, reports and proposals.*

✓ *Comprehend business articles, and documents.*

✓ *Use expressions in Professional context, and acquire presentation skills like one minute talk and pair discussion in professional context.*

✓ *Familiarize and comprehend British accent by listening to recorded speeches and discussions.*

UNIT - 1 **P-6**

BUSINESS ENGLISH VOCABULARY: Glossary of most commonly used words (formal and informal usage), Elements of technical writing - Sentence structure, Reducing verbosity, Arranging ideas logically, Building coherence, Paragraph level and document level, Topic sentence, Cohesive devices, Transitional words, Paraphrasing and précis-writing; Mechanics of writing - Stylistic elements, The rapporteur, The purpose, The reader's viewpoint (audience), Elementary rules of grammar, Choice of diction, Elementary principles of composition, Matters of form, Punctuation, Conventions of business communication, Language and professional tone, Weak links in business correspondence, Ethical concerns in business writing, Code of conduct (not sending illegal, Offensive, Disparaging personal remarks or comments) in written business communication.

UNIT - 2 **P-6**

BUSINESS CORRESPONDENCE: E-mail - Nature and scope, E-mail etiquette, Clear call for action, Common errors in composing e-mails, Office communication such as meeting agenda and minutes of the meeting, Notice, Circular and memo; Letter-Writing - Formal and informal letters, Structure of formal letters, Expressions of salutations, Different types of letters [Such as sales letter, Complaint letter, Response to the complaint letter (dispute resolution), Letter of permission, Letter of enquiring, claim letter, Letter of apology etc], Introductory and concluding paragraphs and clear call for action.

PROFESSIONAL PROPOSAL/REPORT: Differentiating proposals and reports, Drafting formal business proposals, Types of reports such as factual reports, Feasibility reports and survey reports, Parts ofa report (Such as title page, Declaration, Acknowledgements, Table of contents, Abstract, Introduction, Findings, Conclusion and recommendations, Citations, References and appendices).

UNIT - 3 **P-6**

SPEAKING: Speaking in business context, Assertiveness, Politeness, Making requests, Queries and questions, Negotiations, Asking for information, Offering suggestions, Conflict resolution, Contacting clients, Initiating, Addressing delegates (in public), Features of a good power point presentation (making the PPT), Delivering the presentation effectively, Telephone etiquettes, Delivering seminar/proposal/report effectively, Team meeting etiquettes (face to face and conference call), Making effective one minute presentations.

UNIT - 4 **P-6**

READING: Reading and comprehending business documents, Learning business register, Regularizing the habit of reading business news, Suitable vocabulary, Skimming and scanning text for effective and speedy reading and dealing with ideas from different sectors of corporate world in different business contexts.

UNIT - 5 **P-6**

LISTENING: Specific information in business context, Listening to telephonic conversations/messages and understanding the correct intended meaning, Understanding the questions asked in interviews or in professional settings, Summarizing speaker's opinion or suggestion, Enable active listening.

TEXT BOOKS:

1. Guy Brook Hart, "Cambridge English Business Bench Mark: Upper Intermediate", 2nd edition: CUP, 2014.

2. Cambridge: BEC VANTAGE: Practice Tests, CUP, 2002.

ONLINE REFERENCES:

1. http://www.cambridgeenglish.org/exams/business-certificates/business vantage/preparation/

2. https://www.youtube.com/watch?v=qxFtn9pGaTI.

ACTIVITIES:

- *Basic grammar practice, Framing paragraphs on topics allocated.*
- *Paraphrase an article or a video in your own words Finding topic sentences in newspaper articles.*
- *Find out new words from a professional viewpoint Understanding the meaning and its usage.*
- *Peruse samples of well prepared proposals and reports.*
- *Draft different proposals/reports on topics assigned.*
- *Watch videos/ listening to audios of business presentations.*
- *Classroom activities of team and individual presentations.*
- *Use PPTs, mock exercises for BEC speaking.*
- *Present (speaking) the written components completed in Unit 1.*
- *Hand-outs; matching the statements with texts.*
- *Find the missing appropriate sentence in the text from multiple choice, multiple choices.*
- *Use right vocabulary as per the given context and editing a paragraph.*

16PL202 PETROLEUM EXPLORATION

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
25	50	-	-	5	5

Course Description and Objectives:

This course mainly deals with exploring and analyzing active processes of the earth through physical measurement .The objective of this course is to expose students to a broad spectrum of geophysics, including resourse exploration, environmental geophysics, seismology and tectonics.

Course Outcomes:

The student will be able to :

- understand the physics and geology that form the basis for geophysical observation and measurement.
- understand Earth structure and evolution.
- apply skills developed in fundamental courses to geophysical problems.

  quantitatively describe the behavior of natural systems and the principles of geophysical measurement with physics-based mathematical models.

SKILLS:

- *Identify the physical processes governing the behavior of common geophysical systems.*
- *Explain the principles of applying geophysical methods to societally relevant problems, including natural hazards, resource exploration and management, and environmental issues.*
- *Quantitatively describe the behavior of natural systems and the principles of geophysical measurement with physics-based mathematical models.*

UNIT- 1 **L-9, T-3**

Reflection Seismics: BasicPrinciple and Objective, Theory of seismic wave propagation, Types of seismic waves, Absorption and attenueation, reflection, refraction, diffraction and mode conversion of seismic waves.

Refraction Method: Basic principle, geometry of refracted wave path, methodology of refraction profiling, field surveys, recording instrument and energy source. Corrections applied to refraction data. Interpretation of refraction data for understanding basin configuration.

UNIT - 2 **L-9, T-3**

2-D and 3-D seismic data acquisition: Survey objective, geological plan, logistics in the area, recording technique, Seismic velocities, geometry of seismic wave path.Recording systems, geophones, cables and ground electronics. Common depth point technique.

4D seismic methods: Fundamental aspects.

UNIT - 3 **L-9, T-3**

Seismic Data Processing: Objective, concept of autocorrelation, cross correlation and convolution, understanding processing parameters such as deconvolution, NMO, velocity analysis, filtering, stacking and migrations, understanding the concept of time domain and frequency domain for seismic wave.

UNIT - 4 **L-9, T-3**

Seismic Data Analysis and Interpretation: Objective, understanding seismic data in terms of geological information, structural information, statigraphic information, seismic attributes, direct detection of hydrocarbons – AVO technique, inversion integrating geophysical data with geological understanding and identifying prospects for drilling.

UNIT - 5 **L-9, T-3**

Gravity Method: Basic principle and objective, recording instrument, recording technique, data analysis including various gravity corrections, gravity anomalies and geological features.

Magnetic Method: Basic principle and objective, recording instrument, data analysis including various magnetic corrections, magnetic anomalies and geological features.

Aeromagnetic Method: Recording technique and objective, operations advantage.

TEXT BOOK:

1. Fundamentals of Geophysics, Lowri, W ., Cambridge University Press. (1997).

REFERENCE BOOKS:

1. Introduction to Geophysical Prospecting, Dobrin M.B., New York, McGraw-Hill, Inc.
2. Basic Exploration Geophysics, Robinson, E.S. and Coruh C., John Willey and Sons, New York, 1998.
3. Applied Geophysics, Telford,W.M. ,Geldart L.P., Sheriff, R.E., Keys, D.A. (1990.
4. Seismic Interpretation: The Physical Aspect, Anstey N.A., Boston, IHRDC.
5. Seismic data processing: by Yilmaz .

ACTIVITIES:

- *Research, analyze, and synthesize solutions to an original and contemporary geophysics problem.*
- *Make their own observations with a variety of geophysical instruments, and reduce, model, and interpret their data and uncertainties.*

16PL205 PETROLEUM ENGINEERING THERMODYNAMICS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	30	-	-	5	5

Course Description and Objectives:

This course deals with first, second and third laws of thermodynamics, volumetric properties, refrigeration and liquefaction processes. The objective of this course is to provide understanding in the theory and applications of classical thermodynamics, thermodynamic properties and equations of state.

Course Outcomes:

The student will be able to :

- apply fundamental concepts of thermodynamics to engineering applications.
- estimate thermodynamic properties of substances in gas and liquid states.
- determine thermodynamic efficiency of various energy related processes.

SKILLS:

- ✓ *Estimation of thermodynamic properties.*
- ✓ *Determination of heat engine and pump efficiency.*
- ✓ *Identification of reversible and irreversible processes.*
- ✓ *Selection of refrigeration process and refrigerant.*

UNIT - 1 **L-9, T-3**

Introduction : The scope of thermodynamics, defined quantities; temperature, volume, pressure,work, energy, heat, Joules Experiments, SI units.

The first law and other basic concepts : The first law of thermodynamics, thermodynamic stateand state functions, enthalpy, The steady-state steady flow process, Equilibrium, The reversible process, constant-V and constant- P processes, heat capacity.

UNIT - 2 **L-9, T-3**

Volumetric properties of pure fluids : The PVT behavior of pure substances, virial equations,the ideal gas, the applications of the virial equations, Cubic equations of state, generalized correlations for gases.

UNIT - 3 **L-9, T-3**

The second law of thermodynamics : Statements of the second law, heat engines, thermodynamictemperature scales, thermodynamic temperature and the ideal-gas scale, Entropy, Entropy changes of an ideal gas, mathematical statement of the second law, the third law of thermodynamics. Mollier diagram and steam tables.

UNIT - 4 **L-9, T-3**

Thermodynamic properties of fluids : Property relations for homogeneous phases, Residualproperties, Generalized property correlations for gases.

Thermodynamics of flow processes; Principles of conservation of mass and energy for flowsystems, Analysis of expansion processes; turbines, throttling; compression processes – compressors and pumps; Calculation of ideal work and last work, Examples on hydrocarbons and natural gas.

UNIT - 5 **L-9**

Solution thermodynamics : Basic concepts of chemical potential, Phase equilibria, partialproperties, fugacity coefficient, residual and excess Gibbs free energy, Correlations for the estimation of fugacity coefficient, Residual and excess Gibbs energy in vapor liquid equilibria.

Phase Equilibria : Gamma/Phi formulation of VLE, VLE from Virial equations of state and cubicequations of state, Introduction to Vapor- Liquid–Liquid equilibrium (VLLE), Solid-Liquid equilibrium (SLE) and Solid-Vapor equilibrium (SVE), Equilibrium adsorption of gases on solids.

TEXT BOOK:

1. Introduction to Chemical Engineering Thermodynamics, Smith, J.M., H.C. Van Ness and M.M. Abbott, 6th Edition, 8th reprint, McGraw Hill, 2006.

ACTIVITIES:

- *Case study on fundamental laws of thermo dynamics.*
- *Minor projects on evaluation of thermo dynamic properties.*

REFERENCE BOOKS:

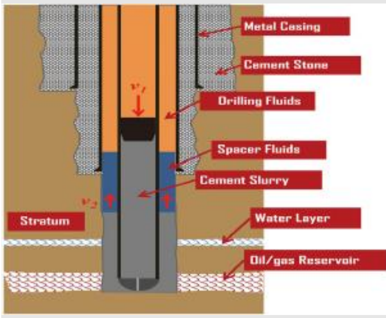
16PL206 DRILLING FLUIDS AND CEMENTING TECHNOLOGY



Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	20	20	45	-	10	-	-

Course Description and Objectives:

This course covers all drilling fluids technology concepts like drilling fluid selection, passing through the mud types, properties and hydraulics that are compatible with formation type & pore pressure, determination of drilling problems related to mud. Finally, drilling fluid separation and its environmental issue. The objective of this course is to provide the required practical knowledge and procedures for performing good cementing Job and also to achieve the successful Well construction Target.

Course Outcomes:

The student will be able to :

- understand the procedure to plan and design a basic well construction scheme.
- understand well control techniques.
- become acquainted with drilling rigs and drilling operations.

SKILLS:

- *Acquire a thorough knowledge of drilling fluids and rheology.*
- *Choose the right equipment for solid removal.*
- *Communicate efficiently with a drilling fluid specialist.*

ACTIVITIES:

- *Significance of waste management in drilling operations.*
- *Process used for controlling and disposing of drilled cuttings such as annular injection and offshore requirements*
- *Drilling fluids toxicity and testing.*
- *The international recommendations for handling non-aqueous fluids are also covered*

UNIT - 1 **L-9**

Drilling Fluids : Overview of drilling fluids, clay chemistry and its application to drilling fluids, types ofclays, hydration, flocculation, aggregation and dispersion. Classification, types and applications of drilling fluids: Water based, oil based, emulsion based, polymer based, surfactant based, foam based and aerated drilling fluids. Criteria of selection of drilling fluid additives and salinity of drilling fluids.

Mud Circulating System: Mud circulating pumps-agitation system-Shale Shaker-Desander-Desilter-Centrifuge.

UNIT - 2 **L-9**

Drilling Fluid Characteristics: Basic functions, properties, maintenance and treatments of drillingfluids. Drilling fluid requirement calculations. Role of formation pressure, mineralogy & petrology in designing drilling fluid. Rock texture and its relation with drilling fluids. Design of technology spe-cific drilling fluids for, environmentally sensitive areas, horizontal\ERD wells, HP-HT wells and depleted Reservoirs.

UNIT - 3 **L-9**

Cements: Cementing, cements & cement slurry: objectives of cementing, oil well cements. Clas-sification of cement, slurry design, slurry additives, factors influencing cement slurry design. Ce-menting equipment. Factors influencing cement rise behind casing and its bridging with rock and casing.

UNIT - 4 **L-9**

Cement formulation and testing: Testing and performance evaluation of cement and cement additives, slurries for casing cementation Formulation/Design of cement slurries for low temperature areas, loss prone areas, depleted reservoirs, and quality control of cementing process.

UNIT - 5 **L-9**

Cementing Methods: Primary cementing, stage cementing, liner cementing, plugging, squeeze cementing techniques in practice. Deep well cementing, squeeze jobs, prevention of gas channel-ing, HT-HP environments, analysis and techniques of evaluation of cement job. Characteristics of good quality cementation. Cementing Calculations.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 20

1. Measurement of mud weight
2. Measurement of mud density.
3. Measurement of mud plastic viscosity.
4. XRD studies of types of clay.
5. Measurement of gel strength.
6. Determination of filtration loss.
7. Determination of Sand content.
8. Determination of Oil, Water and Gas.
9. Determination of consistency of cement slurry (Field Visit).
10. Determination of chemical properties of water base mud.
11. Titeration of water base mud.

TEXT BOOKS:

1. ASME Shale Shaker Committee "Drilling Fluids Processing Handbook", 1st Edition 2004.
2. H. Rabia, "Well Engineering and Construction", paperback, 2001.
3. Erik B Nelson, Dominique Guillot, "Well cementing", 2nd edition, Sugar Land, 2006.

REFERENCE BOOK :

16CH207 PROCESS HEAT TRANSFER

Hours Per Week :

L	T	P	C
3	-	2	4

Total Hours :

L	T	P
45	-	20

WA/RA	SSH/HSH	CS	SA	S	BS
25	50	-	5	5	5

Course Description and Objectives:

This course deals with the phenomena of heat transfer and methodologies applied for solving a wide variety of practical engineering problems. The objective of this course is to provide theoretical and practical knowledge in various modes of heat transfer and its application for designing of process equipments.

Course Outcomes:

The student will be able to :

- understand the basic laws of heat transfer.
- account for the consequence of heat transfer in thermal analyses of engineering systems.
- analyze problems involving steady state heat conduction in simple geometries.
- obtain numerical solutions for conduction and radiation heat transfer problems.
- understand the fundamentals of convective heat transfer process.
- evaluate heat transfer coefficients for natural and forced convection.
- understand the basic mechanism behind boiling and condensation processes.
- analyze heat exchanger performance by using the method of log mean temperature difference.
- calculate radiation heat transfer between black and gray surfaces.

SKILLS:

✓ *Estimate the rate of heat flow through a wall, cylinder or sphere*

✓ *Calculate the insulation thickness for a specified heat loss target.*

✓ *Determine heat transfer coefficient in simple geometries for forced and natural convection.*

✓ *Estimate area of heat exchanger required for specified conditions.*

✓ *Design of heat exchanger.*

✓ *Determine the emissivity of a given body.*

UNIT - 1 **L-9**

HEAT TRANSFER AND ITS APPLICATIONS : Nature of heat flow, Conduction, Convection, Radiation Heat transfer by conduction: Fourier's law of conduction, Thermal conductivity, Steady state conduction, Compound resistances in series, Heat flow through cylinder, Principles of heat flow in fluids: Heat exchange equipment, Counter current & parallel current flows, Energy balances, Rate of heat transfer, LMTD, Individual heat transfer coefficients, Overall heat transfer coefficient.

UNIT - 2 **L-9**

HEAT TRANSFER TO FLUIDS WITHOUT PHASE CHANGE : Regimes of heat transfer, Thermal boundary layer, Heat transfer by forced convection in laminar flow, Heat transfer by forced convection in turbulent flow, Analogy between transfer of momentum and heat, Reynolds analogy, Colburn analogy, Interpretation of dimensionless groups. Natural Convection: Dimensional analysis, Natural convection to vertical shapes and horizontal planes**.**

UNIT - 3 **L-9**

HEAT TRANSFER TO FLUIDS WITH PHASE CHANGE : Drop wise and film type condensation, Coefficients for film type condensation, Practical use of nusselt equations, Condensation of super heated vapors,Pool boiling of saturated liquid, Maximum flux and critical temperature drop.

UNIT - 4 **L-9**

RADIATION HEAT TRANSFER : Fundamental facts concerning radiation, Emission of radiation, Black body radiation, Laws of black body radiation, Absorption of radiation by opaque solids, Radiation between surfaces, Non black surfaces.

UNIT - 5 **L-9**

HEAT EXCHANGE EQUIPMENT : General design of heat exchange equipment, Heat exchangers, Condensers, Boilers. Evaporation: Liquid characteristics, Types of evaporators, Performance of tubular evaporators, Multiple effect evaporators.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 20

1. Estimation of natural convection heat transfer coefficient.
2. Determination of overall resistance in composite wall.
3. Estimation of emissivity of a test plate.
4. Verification of Stefan-Boltzmann's law of radiation.
5. Determination of heat transfer coefficients of double pipe heat exchanger.
6. Estimation of heat transfer coefficient in forced convection.
7. Determination of thermal conductivity of liquid sample.
8. Determination of thermal conductivity of solid sample.
9. Determination of critical heat flux points of nichrome wire.
10. Determination of overall heat transfer coefficient of a given coil.

ACTIVITIES:

- *Mix the heat.*
- *Feel the heat.*
- *Identification of heat exchangers.*
- *Fabrication of double pipe heat exchanger.*
- *Connecting shell and tube heat exchanger setup.*

PL303 PETROLEUM INSTURMENTATION

Course Description & Objectives:

The course provides insight into instruments that are used to measure physical properties in chemical process industries. The objective of this course is to familiarize student with the working principles of standard measurement devices used in engineering applications.

Course Outcomes:

1. Discuss principles involved in the measurement and control of industrial processes.

2. Understand instruments and devices used for designing process control systems.

UNIT - I

QUALITIES OF MEASUREMENT : Elements of Instruments, Static and dynamic characteristics, Response of first order instruments.

TEMPERATURE MEASUREMENTS : Expansion thermometer- Thermoelectric temperature measurements.

UNIT - II

TEMPERATURE MEASUREMENT : Resistance and radiation, Thermal coefficients of resistance, Industrial resistance thermometer bulbs and circuits, Radiation, Photoelectric and optical pyrometers.

COMPOSITION ANALYSIS : Spectroscopic analysis, Chromatography (GC, HPLC, GCMS/LCMS), Color measurement spectrometers.

UNIT - III

MEASUREMENT OF PRESSURE AND VACUUM : Liquid column manometers, Gauge pressure and vacuum measurement, Indicating elements for pressure gauges, Measurement of absolute pressure, Corrosive liquids, Static accuracy and response of pressure gauges.

UNIT - IV

MEASUREMENT OF HEAD AND LEVEL : Head, Density and specific gravity measurement, Direct measurement of liquid level, Pressure measurement in open vessels measurement of interface level, Density measurement.

UNIT- V

FLOW METERING : Head Flow and area flow meters, Open channel meters, Viscosity measurements, Quantity meters, Flow of dry materials. Recording, Indicating and signaling Instruments. PI Diagrams, Control center.

TEXT BOOKS :

1. Donald P. Eckman, "Industrial Instrumentation", 1st edition, Wiley Eastern, 2004.

III Year B.Tech. Petroleum Engg. - I-Semester	L	T	P	To	C
	4	0	-	4	4

PL305 WELL LOGGING & FORMATION EVALUATION

***Course Description & Objectives**:*

This course deals with the Modern logging techniques, Rock Properties, Open hole Logging Measurements, Analysis of Logs and Cores. The objective of this course is to understanding of the principles and applications of open hole well logging data.

Course Outcomes:

1. Scan a well log for quality control.
2. Define zones of interest on a log.
3. Implement basic log quality control and environmental corrections.
4. Determine Archie parameters and using to determine saturations design and supervise a basic logging operation.

UNIT - I

Direct Methods: Mud logging-coring–conventional and sidewall coring - Core analysis. **Concepts of well logging**: What is well logging? - Logging terminology-Borehole environment-Borehole temperature and pressure-Log header and depth scale-Major components of well logging unit and logging setup- Classification of well logging methods-Log presentation- Log quality control.

UNIT - II

Open hole logging: SP Logging- Origin of SP, uses of SP log-Calculation of salinity of formation water- Shaliness-Factors influence SP log.

Resistivity log: Single point resistance log (SPR)- Conventional resistivity logs- Response of potential and gradient logs over thin and thick conductive and resistive formations-Limitations of conventional resistivity tools. Focused resistivity log- Advantages of focused resistivity tools over conventional resistivity tools.

Micro resistivity log: Conventional and focused micro resistivity logs and their application. **Induction log**: Principle of induction tool and the advantages, Criteria for selection of inductionand lateral logging tool, Determination of true resistivity (Rt) of the formation-Resistivity index-Archie's equation.

UNIT - III

Gamma ray log: principle of radioactivity-Uses of gamma ray log-Determination of Shaliness offormation-API counts - Calibration of Gamma ray tool-Statistical fluctuation- Time constant.

Natural Spectral Gamma ray log: Principle and application.

Caliper log: Principle and application of caliper tool.

Density log: Principle of density tool-Environmental corrections-Porosity determination-Tool calibration, Litho density log.

Neutron log: Principle and application of neutron tool, Porosity determination.

Sonic log: Principle and application of sonic log-Bore hole compensation - Determination of primary and secondary porosity, determination of mechanical properties of rock, elastic constants, fractures etc.

UNIT - IV

Cased hole logging: Gamma ray spectral log-Neutron decay time log-Determination of fluid saturation behind casing-Cement bond log- Casing collar log-Depth control- Perforation technique- Free point locater and Plug setting-Casing inspection logs.

Well Velocity Survey: VSP Surveys.

Production logging: Solving production problems with the help of Fluid Density log-Temperature log and Flow meter logs.

UNIT - V

Advances in Well logging: Dip meter log-Formation tester-Cased hole resistivity logs-Nuclear magnetic resonance log & Scanner logs (Sonic scanner, MR scanner Rt scanner).

Calculating the dip of the formations, collection of fluid samples from wells for confirmation of log interpretation, and also recording resistivity in cased holes.

Interpretation: Quick look interpretation- Cross plots. Neutron- Density, Sonic-Density, Sonic-Neutron cross plots-Hingle plot-Mid plot–Correlation-Hydrocarbon reserve estimate.

TEXT BOOKS:

1. Formation Evaluation, Edward J. Lynch, Harper & Row, 1962

2. Well Logging and Formation Evaluation, Toby Darling, Elsevier, New York, 2005.

REFERENCE BOOK:

1. Well Logging & Reservoir Evaluation, Oberto Serra, Editions Technip, 2007.

III Year B.Tech. Petroleum Engg. - I-Semester

L	T	P	To	C
4	0	-	4	4

PL307 WELL COMPLETION, TESTING & SERVICES

***Course Description & Objectives**:*

1. Knowledge of subsurface equipment below well head.
2. Planning and designing of well completion after testing of the hydrocarbon zones available.
3. Knowledge of subsurface circulating equipment and packers.
4. Testing of multi zones in a well with DST/RFT with logging tools as well as surface testing equipment.

Course Outcomes:

The student will be able to:

1. Have the knowledge of various equipment used in & on wells.
2. Have the knowledge of DST/RFT to know the initial potential of the wells.
3. Plan and design the well completion depending of the casing policy and the number of objectives available in the well.
4. Plan for suitable safety valves in sub surface as well as on well head for the safe operation of the high pressure and high temperature wells.
5. Become a good work over engineer to repair and maintenance of a sick well.
6. Be a good CTU (Coil Tubing unit) operator whenever rigs less operation are required to be taken up.

UNIT - I

Well completion: Types of wells- Completion functions- Types of completion.

UNIT - II

Mechanical aspects of well testing- Cased hole logging equipment and application and perforation methods and perforation equipment.

UNIT - III

Packers: Function- Application- Proper selection- Packer setting – Packer loads - water / gas shut off, horizon separation etc.

UNIT - IV

Completion equipment (SSD, SSSV, mandrels, locks etc.)- Data acquisition in wells- Fiber optics- Permanent gauges- Memory gauges- Intelligent completion equipment.

UNIT - V

Tubing string design (dimension, materials and connections etc.) based on pressure, temperature, operating conditions- Media- Safety requirements.

Drill Stem Testing: General Procedure and considerations- Test tool components and arrangement-Analysis of Test data.

Text Books:

Well Completion and Servicing, D. Perrin, Micheal Caron, Georges Gaillot, Editions Technip, 1999.

2. Primer of Well Service, Workover and Completion, Petroleum Extension Service (PETEX), University of Texas at Austin, 1997.

III Year B.Tech. Petroleum Engg. - I-Semester	L	T	P	To	C
	4	0	-	4	4

PL309 PETROLEUM REFINERY ENGINEERING

Course Description & Objectives:

To understand the properties and their significance of crude oils and petroleum fractions. To understand, design and analyze the various petroleum refinery processes including primary, secondary and upporting processes.To understand the process technologies for the petrochemical products.

Course Outcomes:

The student will be able to :

- For a given crude assay, how to handle and store the crude oil
- What will be the yield, quality of the product, estimation for the primary processes and treatmentconsiderations?
- Maximize the profitable products and minimize the quality giveaway
- Ability to process the opportunity crudes (e.g. Blending with other

crudes) to maximize the throughput and gross margin

- Application of suitable Hydro processing/treatment technologies to meet product qualities and to minimize the CAPEX & OPEX (capital and operating expenditure).
- Application of suitable thermal/catalytic conversion (cracking) processes for Vacuum gas oil upgradation and to produce desired fuel blend components and petrochemical feed stocks.

UNIT - I

Introduction: Overall refinery operations & Indian scenario.

Refinery feed stocks: Crude oil classification-Composition and properties-Composition of petroleum crude suitable for asphalt/coke manufacture – Evaluation of crude oils.

UNIT - II

Petroleum Products and their specifications: LPG- Gasoline- Diesel fuels- Jet and turbine fuels

–Lube oils-Heating oils – Residual fuel oils - Wax and Asphalt- Petroleum coke- All Product speci- fications-Product blending.

UNIT - III

Crude distillation: Atmospheric and Vacuum distillation units, Auxiliary equipment such as desalters, pipe-still heaters and heat exchanger trains etc.

Catalytic reforming and isomerization: Catalytic reforming processes (for petroleum and petrochemical feed stocks) – Isomerization Processes -Feed stocks-Feed preparation – Yields.

UNIT - IV

Thermal & Catalytic cracking processes: Visbreaking- Delayed Coking –Fluid Catalytic cracking and Hydrocracking - Feed stocks –– Catalysts - Process variables –Product Recoveries- Yield estimation.

Hydrotreating & Hydroprocessing: Naphtha, Kerosene, Diesel, VGO & Resid, Hydrotreating / Hydroprocessing – Feed stocks – Process description and Process variables

UNIT - V

Petrochemical Industry: – Indian Petrochemical Industry- Feed stocks – Process description and Process variables-Naphtha cracking-Gas cracking and Gas reforming. **Chemicals from gas reforming**: Methanol-Acetic acid- Ammonia and urea. **Chemicals from ethylene:** Ethylene oxide-Mono ethylene glycol-Ethyl benzene-Styrene.

Polymers: LDPE, HDPE & LLDPE and Polypropylene – PVC - Polystyrene.

TEXT BOOKS :

PL315 PROCESS INSTRUMENTATION LAB

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 20

1. Temperature measurement using thermocouple.
2. Temperature measurement using RTD.
3. Specific gravity measurement of solid specimen.
4. Analysis of amino acids by thin layer chromatography.
5. Analysis of amino acids by paper chromatography.
6. Calibration of rotameter.
7. Viscosity measurement using redwood viscometer.
8. UV visible spectrometer.
9. Gas Chromatography.

10. High performance liquid chromatography.

11. Measurements and Calibration of pressure.

TEXT BOOKS:

1. Donald P. Eckman, “Industrial Instrumentation”, 1st edition, Wiley Eastern, 2004
2. Patranabis, “Principles of Industrial Instrumentation”, 2nd edition, Tata McGraw-Hill, 2007.

	0	0	3	3	2

PL317 DRILLING TECHNOLOGY & WELL LOGGING LAB

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 20

1. Evaluation of porosity, saturation, shaliness etc. from logs. (3 practicals).
2. Experiments based on log interpretation, preparation and evaluation of log cross-section. (3 practicals).
3. Standard log interpretation methods.
4. Cross-plotting methods: neutron-density, sonic-density and sonic-neutron etc.
5. Clean sand interpretation.
6. Concept of invasion – Rxo, Tornado charts.

7. Shaly sand interpretation.
8. Interpretation of depositional environment (3 exercises)
9. Correlation using logs.
10. Use of any standard log interpretation software.
11. Field Visit.

TEXT BOOKS:

1. Formation Evaluation, Edward J. Lynch, Harper & Row, 1962.
2. Well Logging and Formation Evaluation, Toby Darling, Elsevier, New York, 2005.

III Year B.Tech. Petroleum Engg. - I-Semester	L	T	P	To	C
	0	0	3	3	2

PL319 PETROLEUM ANALYSIS LAB

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 20

1. Measuring the density, specific gravity and API gravity Using Hydrometers.
2. Measuring the density, specific gravity and API gravity by pycnometer.
3. Measuring the absolute viscosity using Brookfield Viscometer.
4. Measuring the kinematic viscosity using U – tube Viscometer.
5. Determination of Flash point by pensky-Martens closed tester method.

6. Determination of cloud point and pour point of crude oil.
7. Determination of the water in crude oil by distillation.
8. Determination of the water and sediments in crude oil by the centrifuge method.
9. Determination of the total salts content of crude oil by conductivity method.
10. Determination of natural gas composition using GC chromatography.

III Year B.Tech. Petroleum Engg. - II-Semester	L	T	P	To	C
	4	0	-	4	4

PL302 PETROLEUM RESERVIOR ENGINEERING-I

Course Description & Objectives:

To impart knowledge in the basic concepts like PVT analysis for oil, Material balance applied to oil reservoir, Darcy's law and applications, well inflow estimation for stabilized flow conditions.

Course Outcomes:

The student will be able to :

- To make them suitable as reservoir engineers for petroleum industry.

UNIT - I

Some basic concepts in reservoir engineering : Calculation of hydrocarbon volumes- Fluid pressure regimes- Oil recovery and recovery factor-Volumetric gas reservoir engineering– Application of the real gas equation of state - Gas material balance and recovery factor-Hydrocarbon phase behavior.

UNIT - II

PVT analysis for oil: Definition of the basic PVT parameters–Collection of fluid samples -Determination of the basic parameters in the laboratory and conversion for field operating conditions - Alternative manner of expressing PVT lab analysis results - Complete PVT analysis.

UNIT - III

Material balance applied to oil reservoirs: General form -The material balance expressed as a linear equation- Reservoir drive mechanism- Solution gas drive- Gas cap drive- Natural water drive- Compaction drive under related pore compressibility phenomena.

UNIT - IV

Darcy's law and applications: Darcy's law and field potential- Sign convention- Units and units conversion- Real gas potential – Datum pressures- Radial steady state flow and well stimulation-Two phase flow- Effective and relative permeabilities.

UNIT - V

The basic differential equation for radial flow in a porous medium- Derivation of the basic radial differential equation – Conditions of solution – The linearization of the equation for fluids of small and constant compressibility. **Well inflow estimation for stabilized flow conditions:** Semi steady state solution–Steady statesolution – Example of the application of the stabilized inflow equations – Generalized form of inflow equation under semi steady state conditions.

TEXT BOOKS:

1. Fundamentals of Reservoir Engineering, L.P. Dake, Elsevier Science, 1978 (17th Impression 1998).
2. B. C. Craft – M. Hawkins Applied Petroleum Reservoir Engineering, Third Edition, Revised by Ronald E. Terry & J. Brandon Rogers, Prentice Hall, New York, 2014.

	4	0	-	4	4

PL304 SURFACE PRODUCTION OPERATIONS

Course Description and Objectives:

This course covers the fundamentals and methodologies in the petroleum refining processes. The objective of this course is to train students on the concepts of petrochemicals, polymerization and the unit operations involved in it.

Course Outcomes:

The student will be able to:

- gain knowledge on the unit process involved in petroleum refining process.
- understand the production methods for manufacturing industrial polymers.
- familiarize with the various issues arising in petroleum refining operations.

UNIT - I

Production facilities: Various types of facilities Controlling the process-Basic systemconfiguration design & selection of facilities: Wellhead and manifold-Separation-Initial separation pressure- Stage Separation, Selection of Stages, Process flow sheets, P&IDs, monitoring well performance testing & optimization of flow.

UNIT - II

Two phase liquid and gas separation: Functional sections of a gas-liquid separator- Inlet diverter section- Liquid collection section- Gravity settling section- Mist extractor section- Equipment description of different separators-Scrubbers- Slug catchers- Selection considerations- Vessel internals- Mist extractors- Potential operating problems. **Three phase oil, gas and water separation:** Equipment description- Horizontal separators-Derivation of equation- Free-water knockout- Flow splitter- Horizontal three-phase separator with a liquid "Boot"-Vertical separator- Selection considerations-Vessel internals- Coalescing plates-Turbulent flow coalesces and potential operating problems.

UNIT - III

Crude oil treating: Equipment description of various treaters and heaters-Indirect and fired heaters- Heater sizing- Vertical heater-treaters- Coalescing media- Horizontal heater treaters-Electrostatic heater-treaters- Oil dehydrators- Emulsion treating theory Agitation- Emulsifying agents-Demulsifies- Field optimization- Emulsion treating methods- General considerations-Chemical addition- Amount of chemical- Bottle test considerations- Chemical selection.

Oil desalting systems: Oil desalting systems-Equipment description of desalters- Mixing equipment- Process description- Single stage desalting-Two stage desalting; Monitoring of oil quality.

UNIT - IV

Produced water treating systems: Characteristics of produced water-Sand and other suspended solids- Dissolved gases- Oil in water emulsions-Dissolved oil concentrations- Dispersed oil-Toxicants- Gravity separation-Coalescence- Dispersion- Flotation- Filtration- Equipment description-Retention time and performance considerations-Design of produced water treating systems.Disposal standards- Disposal methods-Offshore & Onshore operations.

UNIT - V

Storage facilities, measurements custody transfer marketing- transportation modes & dispatch. Gas dehydration compression measurements custody transfer marketing- transportation dispatch. Fire protection systems for tank farm pumping /compressor stations.Water injection facilities, Sources of water, Treatment system, Pumping, Chemical dosing, Identification wells, Patterns of injections well performance monitoring reservoir monitoring.

PL306 PROCESS DYNAMICS & CONTROL

Course Description & Objectives:

To understand and be able to describe quantitatively the dynamic behavior of process systems. To learn the fundamental principles of control theory including different types of controllers and control strategies. To estimate the stability limits for a system, with or without control.

Course Outcomes:

The student will be able to :

- Describe a process, how it works and what the control objectives are.
- Describe processes with appropriate block diagrams.

- Numerically model a process.
- Identify the stability limits of a system.

UNIT - I

FIRST ORDER SYSTEM : Introduction to process dynamics and control, Response of first order systems, Physical examples of first order systems, Response of first order systems in series. Higher order systems, Second order systems and transportation lag.

UNIT - II

CONTROL SYSTEM : Controllers and final control elements, Block diagram of a chemical reactor, Control Systems, Closed loop transfer functions, Transient response of simple control systems.

UNIT - III

STABILITY CRITERIA : Stability, Routh array, Root locus, Application of Root locus to control systems.

UNIT - IV

FREQUENCY RESPONSE ANALYSIS : Introduction to frequency response, Control systems design by frequency response, Bode diagrams.

UNIT - V

ADVANCED CONTROL STRATEGIES : Advanced control strategies, Cascade control, Feed Forward control, Ratio control, Smith predictor, Dead time compensation, Internal mode control. Controller tuning, Process Identification, Different types of control valves and their characteristics.

PL308 PETROLEUM ECONOMIICS & ASSET MANAGEMENT

Course Description & Objectives:

Understand the importance of petroleum sector in the world economy, both the macro and micro-economic environment and as applicable to India.

Course Outcomes:

The student will be able to :

- To have an overview of the regulatory frame related to exploration as per NELP.
- Understand geopolitical risks and opportunities and hedging strategies to mitigate market and price risks.

UNIT - I

Macro-Economic Approach of Petroleum Industry: Political environment related to petroleum industry and issues related to government and corporate interests, Need for understanding petroleum economics required to make investment decisions; Introduction, Role and value of Oil & Gas, Evolution of national oil companies, Organization of petroleum exporting countries.

UNIT - II

Principles, Methods and Techniques of Petroleum Engineering Economics: Introduction,outline and key terminologies and generic issues of micro-economic analysis applicable to all sectors of the oil and gas supply chain, Capital budgeting and capital efficiency, Sources of revenue and cost and profitability analysis, Operating expenditures (opex) and their fixed, variable and marginal components, Economic indicators and yardsticks used to rank asset values (NPV, IRR, etc.).

UNIT - III

Managing and Mitigating Uncertainty and Risk: Risk, uncertainty and decision analysis, Analysis of alternative selections and replacements**,** Managing and Mitigating uncertainty and Risk-Break even and sensitivity analysis, Optimization Techniques, Geopolitical risks and opportunities and hedging strategies to mitigate market and price risks, Asset valuation process: fair market value, probability and risk.

UNIT - IV

Application and Project Evaluation: Project lifecycles, optimum economic life and multi-year cash flows, Oil fields exploration and drilling operations, Oil fields' estimation of oil reserves and evaluation of an oil property, Project financial analysis, Project development and Joint development utilization oil fields production operations, Oil transportation, Crude oil processing.

UNIT - V

Valuing Petroleum Assets, Portfolios and Companies: Asset valuation process: fair market value, probability and risk, Risk adjustments when valuing petroleum reserve categories, The portfolio approach to asset and corporate management, Portfolio characterization, balance and diversification.

Demand and Marketing of Petroleum Products: Crude oil fundamentals, Price of crude, Crudeoil prices in transactions, Internal Markets and Prices, Marketing and sale of Motor, Aviation, Lubricant, Asphalt and Propane;. Transportation: Fundamentals of transportation, Pipelines, Oil tankers, Downstream transportations, Distribution of petroleum products.

PL350 FUNDAMENTALS OF LIQUEFIED NATURAL GAS

Course Description & Objectives:

To impart basic knowledge of LNG and it's prospective. To learn different liquefaction tech- nologies of LNG. To have knowledge on different functional units on receiving terminals.

Course Outcomes:

The student will be able to :

- To analyze transportation of LNG and regasification.
- To understand HSE of LNG industry.
- Have good knowledge on LNG process.

UNIT - I

Introduction: Overview of LNG industry: History of LNG industry – Base load LNG – Developing an LNG Project – World and Indian Scenario – Properties of LNG.

UNIT - II

Liquefaction Technologies: Propane precooled mixed refrigerant process – Description of Air products C3MR LNG process – Liquefaction – LNG flash and storage.

Cascade process: Description of Conoco Phillips Optimized Cascade (CPOC) process – Liquefaction – LNG flash and storage.

Other Liquefaction Processes: Description of Linde MFC LNG process- Precooling and Liquefied Petroleum Gas (LPG) recovery – Liquefaction and Subcooling- Trends in LNG train capacity – Strategy for grassroots plant- Offshore LNG production.

UNIT - III

Supporting Functional Units in LNG Plants: Gas pretreatment: Slug catcher – NGL stabilization column – Acid gas removal unit – Molecular sieve dehydrating unit – Mercury and sulfur removal unit – NGL recovery – Nitrogen rejection – Helium recovery.

UNIT - IV

Receiving Terminals: Receiving terminals in India – Main components and description of marine facilities – Storage capacity – Process descriptions.

Integration with adjacent facilities – Gas inter changeability – Nitrogen injection – Extraction of C2+ components.

UNIT - 5

LNG Shipping Industry & Major Equipment in LNG Industry: LNG Shipping Industry: LNG fleet – Types of LNG ships – Moss – Membrane – prismatic; Cargo measurement and calculations. Major equipment in LNG industry – Cryogenic heat exchangers: Spiral – Wound heat exchangers – Plate & fin heat exchangers – Cold boxes; Centrifugal compressors – Axial compressors – Reciprocating compressors;, LNG pumps and liquid expanders – Loading Arms and gas turbine.

PL310 PETROLEUM RESERVOIR ENGINEERING-I LAB

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total Hours-20

1. Determination of porosity using water saturation method.
2. Measurement of surface tension & interfacial tension with the ring Tensiometer. Equipment: Tensiometer.

3. Measurement of surface tension using capillary rise method.
4. Measurement of surface tension with the ring Stalagnometer.
5. Determination of fluid density using Pycnometer and hydrometer methods. Equipment: Pycnometer and hydrometer.
6. Liquid viscosity measurement using capillary tube viscometer (Ostwald type). Equipment: Capillary tube viscometer.
7. Liquid viscosity measurement using falling ball tube method.
8. Determination of capillary pressure of reservoir rock (core) using porous plate method. Equipment: Capillary pressure cell.
9. Absolute permeability measurement of water. Equipment: The Darcy apparatus.
10. Measurement of contact angle (between oil, water and solid surface) using imaging method. Equipment: The image system set-up.
11. Determination of relative permeability of oil-water using unsteady state method. Equipment: Relative permeability apparatus

TEXT BOOKS:

PL312 PROCESS DYNAMICS & CONTROL LAB

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 20

1. Dynamics of 1st order systems [Thermometer].
2. Response of 2nd order system [Manometer].
3. Reponse of single tank system.
4. Response of interacting & non-interacting system for step input.
5. Response of interacting & non-interacting system for pulse input.
6. Control of pressure by using pressure control trainer.
7. Response of control valves.
8. Response of 1st and 2nd order system using Mat Lab.
9. Temperature control by using temperature control trainer.
10. Control of level by using level control trainer.

TEXT BOOKS:

1. Donald R Coughanowr, “Process System Analysis and Control” 3rd edition, McGraw-Hill, 2011.

AUTOMOBILE ENGINEERING

16AE246 BASIC AUTOMOBILE ENGINEERING

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course offers insight into the recent advancements in various automotive technologies as alternatives to the conventional ones. As an advanced level course, it provides the learner with the knowledge of innovative technologies that help trace, control and manage vehicle remotely. The objective of this course is to provide up to date technologies and innovations in automotive industry in various aspects of vehicle operation. It also includes advanced engine technologies that deliver superior efficiency and fuel economy with lower emissions.

Course Outcomes:

The student will be able to:

- ✓ understand and work with different vehicle power systems
- ✓ gain knowledge on latest technologies such as stratified charge
- ✓ combustion engines
- ✓ work with various vehicle and engine control systems that monitor fuel economy,
- ✓ emission measurement etc.
- ✓ understand and propose advanced road networks for safe and fast travel

SKILLS ACQUIRED:

- ✓ Analyze combustion process in IC engines and gas turbines
- ✓ Formulate chemical kinetic mechanisms
- ✓ Analyze effect of air fuel ratio on combustion efficiency
- ✓ Perform flame speed correlations and study its influence
- ✓ Differentiate burning of fuel in different engines
- ✓ Analyze combustion characteristics of different alternative fuels
- ✓ Identify different models for combustion analysis

UNIT – I

Introduction: Layout of automobile – introduction chassis and body components. Types of Automobile engines, cylinder arrangement – Power unit – Introduction to engine lubrication

UNIT-II

Cooling System : Cooling Requirements, Air Cooling, Liquid Cooling,Thermo, water and Forced Circulation System – Radiators – Types – Cooling Fan – water pump, thermostat, evaporative cooling

Fuel System: SI Engine and CI Engine: Fuel supply systems, Mechanical and electrical fuel pump – filters – carburettor – types – air filters – injection systems.

UNIT- III

Ignition System: Function of an ignition system, battery ignition system, constructional features of storage, battery, spark plug – Magneto coil ignition system, electronic ignition system.

Electrical System: Charging circuit, generator, starting system, lighting systems, Horn, wiper, fuel gauge – oil pressure gauge, engine temperature indicator etc.

UNIT – IV

Transmission System : Clutches, principle, types, cone clutch, single plate clutch, multi plate clutch, magnetic and centrifugal clutches, gear boxes, types, sliding mesh, constant mesh, synchro mesh gear boxes,. Propeller shaft universal joint, differential.
Suspension System: Objects and types suspension systems

UNIT – V

Braking System: Types of brake System. **Steering System** : Steering geometry – camber, castor, Steering gearbox – types,

.

16AE206 ADVANCED THEORY OF I.C. ENGINES

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
8	30	4	10	4	5

Course Description and Objectives:

The course aims to develop the students with the knowledge about the advanced theory and working of I.C engines and the phenomena of combustion and modeling.

Course Outcomes:

Upon the successful completion of the course, learners will be able to

a) explain the various working cycles of engine.
b) describe the various types of combustion in IC engines.
c) illustrate the engine combustion parameters.
d) describe the different types of modern engines.
e) explain the modern electronic engine management system (EMS) of IC engines.

SKILLS ACQUIRED:

1. Able to develop the basic knowledge of I.C. Engine working & how combustion takes places.
2. Able to gain knowledge about the fuel system used in I.C engine
3. Able to understand about Locomotive and marine engines.
4. Able to understand Photographic studies of combustion processes.

ACTIVITIES:

1. Develop project on modeling of engine piston
2. Develop project on different IC combustion analysis in IC engines.

UNIT – I

Introduction: Fuel air cycle and Actual cycle analysis, Properties of IC engine fuels, Refining process, chemical composition and molecular structure of fuels, octane number, cetane number. Knock rating of SI engine fuels.

UNIT – II

Combustion of Fuels: Combustion Stoichiometry of petrol, diesel, alcohol and hydrogen fuels – Chemical energy and heating values – Chemical equilibrium and maximum temperature – SI engine combustion – Flame velocity and area of flame front –performance number – CI engine combustion. Fuel spray characteristics – droplet size, penetration and atomization.

UNIT – III

Combustion Modeling: Basic concepts of engine simulation – Governing equations, thermodynamic models – SI engine and CI engine models.

UNIT – IV

Non-Conventional I.C. Engines: Adiabatic and L.H.R. engines – Variable compression ratio engine – Wankel rotary combustion engine – Free piston engine - MAN combustion chamber and multi fuel engines – Stratified charge and lean burn engines – Locomotive and marine engines.

UNIT – V

Combustion Analysis in I.C. Engines: Photographic studies of combustion processes –

P-E diagrams in SI and CI engines, Rate of heat release – hot wire and laser Doppler anemometry and velocimetry for flow and combustion analysis in IC engines.

16AE242 MODERN VEHICLE TECHNOLOGY

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course aims to equip students with the recent advancements in various automotive systems which have become indispensable for comfort, safety, navigation and engine management. If offers up to date technologies and innovations in automotive industry in various aspects of vehicle operation. It also includes driver and passenger information systems, entertainment systems, electronic engine management systems that ensure smooth running of the automobile.

Course Outcomes:

Upon successful completion of this course, the student should be able to:

a. Know about the Modern Automobile accessories and engine management system
b. Gain knowledge about various suspension systems.
c. Understand the concept of automotive air-conditioning systems.
d. Know about various collision warning systems.
e. Know about passenger comfort and convenient systems.

SKILLS ACQUIRED:

- ✓ Able to identify various information systems
- ✓ Able to identify safety systems
- ✓ Able to understand the working of driver monitoring system, vehicle support systems, etc.
- ✓ Able to identify and propose various comfort systems.
- ✓ Able to understand requirements and characteristics of comfort suspension systems
- ✓ Able to understand working of adaptive cruise control, noise control and engine cut-off technologies
- ✓ Able to understand various electronic engine management systems.

ACTIVITIES:

- ✓ Identify driver assisting systems and testing
- ✓ Testing collision avoidance system and vehicle status monitoring systems
- ✓ Use GPS, geographical systems for navigation
- ✓ Working of air bags and testing of ABS, traction control, etc.
- ✓ Testing and understanding adaptive cruise control system
- ✓ Test cylinder cut-off technology and study its effect.
- ✓ Understand working of electronic engine management system
- ✓ Understand the working of electronic fuel injection systems.

UNIT - I

Driver Information Systems: Introduction, driver support systems – driver information, driver perception, driver convenience, driver monitoring. Vehicle support systems – general vehicle control, collision avoidance, vehicle status monitoring.

UNIT - II

Driver Assisting Systems: Global positioning systems, geographical information systems, navigation systems, automotive vision system, road recognition, driver assistance systems.

UNIT - III

Safety Systems: Active and passive safety systems, Airbags, seat belt tightening system, collision warning systems, child lock, anti lock braking systems, traction control, Electronic Stability Programme. Crash worthiness of vehicle, vehicle crash testing, testing with dummies.Security Systems:Anti theft technologies, smart card system, number plate coding.

UNIT - IV

Comfort Systems:

Active suspension systems, requirement and characteristics, different types, power steering, collapsible and tiltable steering column, power windows, biometric systems.

Adaptive Control Systems: Adaptive cruise control, adaptive noise control, anti spin regulation, cylinder cut- off technology.

UNIT - V

Electronic Engine Management: The Feedback control carburettor, single point and multipoint injection system, working of electronic fuel injector, different types of electronic fuel injection systems like L, K, KE, LU, LH and Motronic, ME & MH systems.

TEXT BOOKS:

16AE305 TWO AND THREE WHEELERS TECHNOLOGY

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description & Objectives:

To develop the basic knowledge of the students in constructional details of two and three wheelers. To develop the skills of the students in the operating principles.

Course Outcomes:

On successful completion of this course students will be able to:

1. Understand the working of two and four stroke engines.
2. Understand the functioning of clutch and gear box.
3. Know the wheels, tyres, suspensions and braking systems.
4. Familiarize the latest models of two wheelers.
5. Understand the operations of three wheelers and latest models of three wheelers.

SKILLS ACQUIRED:

- ✓ Able to understand working of two wheelers.
- ✓ Able to understand working of three wheelers.
- ✓ Able to understand the faults in two and three wheelers.
- ✓ Able to understand the changes in design.

ACTIVITIES:

- ✓ Ability to Assembly and Dismantling of three wheeler Gear Box.
- ✓ Ability to Assembly and Dismantling of two wheeler Gear Box and clutch assembly.

UNIT I: Power Unit :

Two stroke SI engine, four stroke SI engine; merits and demerits. Symmetrical and unsymmetrical port timing diagrams. Types of scavenging processes; merits and demerits, scavenging pumps. Rotary valve engine. Fuelsystem. Lubrication system. Magneto coil and battery coil spark ignition system, electronic ignition system. Starting system; Kick starter system.

UNIT II: Chassis and Sub-Systems :

Mainframe and its types. Chassis and shaft drive, Single, multiple plates and centrifugal clutches. Gear box and gear controls. Front and rear suspension systems. Shock absorbers. Panel meters and controls on handle bar.

UNIT III: Brakes, Wheels and Tyres :

Drum brakes, disc brakes, front and rear brake links, layouts. Spoked wheel, cast wheel, disc wheel, disc types. Tyres and tubes.

UNIT IV: Two Wheelers:

Case study of major Indian models of motorcycles, scooters and mopeds.TVS mopeds and motorcycles, Hero Honda motorcycles, Bajaji Scooters and motorcycles, Yamaha, Enfield motorcycles. Servicing and maintenance.

UNIT V: Three Wheelers :

Case study of Indian models.Auto rickshaws, pickup van, delivery van and trailer. Maintenance:& Fault tracing.

16AE344 VEHICLE MAINTENANCE

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course is to make the students have a complete knowledge on the vehicle maintenance procedures and acquire skills in handling various situations where the vehicle is likely to breakdown. It also provides basic knowledge on the various maintenance schedules and work shop records. The objectives are to develop the skills of the students in the Maintenance of vehicles and to serve as a pre-requisite course for other courses in PG programs, specialized studies and research.

Course Outcomes:

Upon completion of this course, the student should be able to:

- ✓ Know the various forms and records of work shop.
- ✓ Understand the functioning of engines and its trouble shooting.
- ✓ Know the Chassis and suspension maintenance.
- ✓ Maintain the Electrical equipment and trouble shooting.
- ✓ Troubleshoot the fuel block, Radiator boiling and lubrication system.

SKILLS ACQUIRED:

- ✓ Able to identify requirements to formulate a maintenance schedule
- ✓ Able to prepare check lists, inspection schedules etc.
- ✓ Able to establish different maintenance procedures and schedules for different systems of an automobile

ACTIVITIES:

- ✓ Identify requirements to prepare different maintenance schedules.
- ✓ Understand and differentiate between different schedules.
- ✓ Prepare different preventive maintenance schedules for different vehicular systems.

UNIT - I

Maintenance of Records and Schedules: Importance of maintenance, preventive (scheduled) and breakdown (unscheduled) maintenance, requirements of maintenance, preparation of check lists. Inspection schedule, maintenance of records, log sheets and other forms, safety precautions in maintenance.

UNIT - II

Engine Maintenance: Dismantling of engine components and cleaning, cleaning methods, visual and dimensional inspections, minor and major reconditioning of various components, reconditioning methods, engine assembly, special tools used for maintenance overhauling, engine tune up.

UNIT - III

Chassis & Body Maintenance: Chassis-Mechanical and automobile clutch and gear box, servicing and maintenance, maintenance servicing of propeller shaft and differential system. Maintenance servicing of suspension systems. Brake systems, types and servicing techniques. Steering systems, overhauling and maintenance. Wheel alignment, computerized alignment and wheel balancing. Body-Vehicle body maintenance, minor and major repairs. Door locks and window glass actuating system maintenance.

UNIT - IV

Electrical System Maintenance: Testing methods for checking electrical components, checking battery, starter motor, charging systems, DC generator and alternator, ignitions system, lighting systems. Fault diagnosis and maintenance of modern electronic controls, checking and servicing of dash board instruments.

UNIT - V

Maintenance of Fuel System, Cooling Systems, & Lubrication System: Steering and Servicing and maintenance of fuel system of different types of vehicles, calibration and tuning of engine for optimum fuel supply. Cooling systems, water pump, radiator, thermostat, anticorrosion and antifreeze additives. Lubrication maintenance, lubricating oil changing, greasing of parts.

BIOINFORMATICS

16BT254 ELEMENTS OF BIOINFORMATICS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Bioinformatics is the science of storing, extracting, organizing, analyzing, interpreting and using information. The approaches to the discipline of bioinformatics incorporate expertise from the biological sciences, computer science and mathematics. This elective in bioinformatics is designed for students interested in molecular biology and genetics, information technologies and computer science. Bioinformaticists are involved in the analysis of the human genome, identification of targets for drug discovery, development of new algorithms and analysis methods, the study of structural and functional relationships, and molecular evolution.

Course Outcomes:

- knowledge and awareness of the basic principles and concepts of biology, computer science and mathematics
- existing software effectively to extract information from large databases and to use this information in computer modeling
- problem-solving skills, including the ability to develop new algorithms and analysis methods
- an understanding of the intersection of life and information sciences, the core of shared concepts, language and skills the ability to speak the language of structure-function relationships, information theory, gene expression, and database queries.

SKILLS ACQUIRED:

- ✓ Design, conduct and interpret scientific research on bioinformatics.
- ✓ Conduct statistical analysis of biological data pertaining to genomics and proteomics.
- ✓ Apply a scientific approach to problems involving molecular phylogeny.

ACTIVITIES:

- ✓ Retrieval of FASTA format from databases.
- ✓ Perform BLAST and FASTA software analysis for both nucleic acids and amino acid sequences.
- ✓ Perform pair wise and multiple sequence alignments.
- ✓ Construct phylogenetic trees using software tools such as PHYLIP and PAUP.

UNIT - I

Basics of Bioinformatics: Introduction to bioinformatics; Concepts related to Molecular Biology; Scope of Bioinformatics.

UNIT - II

Biological Databases and its Types: Introduction to Databases; Need for Biological Databases; Nucleic acid Databases (NCBI, DDBJ & EMBL); Protein Database(SWISSPROT, PIR); Structure databases (PDB, CATH); Other Databases of Patterns/Motifs/System Biology(Gene and protein network databases)

UNIT - III

Sequence Analysis: Various file formats for molecular Biology experiment(plain sequence format, EMBL, Fasta, FastQ, GCG, Genbank, IG); Basic concepts of sequence similarity, identity and homology, definitions of homologues, orthologues, paralogues; Scoring matrices: (PAM and BLOSUM), Sequence based Database Search.

UNIT - IV

DNA sequencing, Assembly and Sequence alignment and Visualization: First Generation Sequencing; Alignments; Local alignment and Global alignment; Pairwise alignment (BLAST and FASTA) and Multiple Sequence alignment (Clustal W); 3D structure Viewers (Rasmol Pymol).

UNIT - V

Phylogeny and Applications of Bioinformatics: Phylogeny: Phylogenetic analysis, Definition and description of phylogenetic trees and various types of trees, Method of construction of Phylogenetic trees [distance based method (UPGMA, NJ), Maximum Parsimony and Maximum Likelihood method]; Different fields: Structural Bioinformatics, Cheminformatics, Immunoinformatics; Drug discovery: Drug discovery Process, Role of Bioinformatics in Drug Design, Drugbank.

Text Books:

1. Introduction to Bioinformatics by Aurther M lesk.
2. David W Mount, Bioinformatics: Sequence and Genome Analysis, 2nd Edition, cold Spring Harbor Press.
3. Bioinformatics and Functional Genomics (2nd edition) by Jonathan Pevsner, Wiley-Liss, ISBN#978-0-470-08585-1.

3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course deals with genomes of various organisms and their comparisons. The main objective of this course is to find genomic information and resources also to provide students adequate knowledge in annotating genes.

Course Outcomes:

The students will be able to:

- ✓ To understand the basic concepts of Comparative genomics.
- ✓ Acquire adequate insights into the human genome project.
- ✓ Learn the utility of phylogenetic trees in evolutionary thinking.
- ✓ Understand the fundamentals of bacterial and vertebrate evolution.

SKILLS ACQUIRED:

- ✓ Alignment of biological sequences of whole genome.
- ✓ Phylogenetic analysis to evaluate evolutionary relationship between different species or genus.
- ✓ Comparison of whole genome sequences of different species to assign functional properties of genes.
- ✓ Gene prediction and annotation

ACTIVITIES:

- ✓ Sequence alignment with tools like BLAST and FASTA.
- ✓ Construction of phylogenetic trees.
- ✓ Annotation of a gene with unknown function by comparative genomics.

UNIT - I

Introduction to comparative genomics: What is "comparative genomics"? Timeline of comparative genomics developments. Databases for genomics resources: NCBI. The history of the Human Genome Project.

UNIT - II

Obtaining and Assembling Sequences: Hierarchical shotgun sequencing, Large-scale sequencing methods: cloning and BAC library creation. Introduction to evolutionary thinking: Phylogenetic analyses: tree terminology and parsimony.

UNIT - III

Gene Identification and Annotation: Databases and tools for annotating sequence. Modifying search strategies; searching different databases, Inferring gene function from relatedness to other genes, Finding Open Reading Frames (ORFs).

UNIT - IV

Genome Comparisons I: Organelles: Phylogenetic analyses: introduction to programs, Mitochondrial Genomes: Size, content, and gene order, The minimal genome, Survey of bacterial genomes.

UNIT - V

Genome Comparisons II: Bacteria and Vertebrates : Microbial genes in the human genome: lateral transfer or geneloss?. Phylogenetic analyses to determine relationships and interpret character evolution in Bacteria. Vertebrate evolution based on genome comparisons. Human and chimpanzee genome comparisons

16BT365 ALGORITHMS IN BIOINFORMATICS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

The course aims to familiarize with the Computational Problems in Biology useful for aligning sequences, phylogeny tree construction, sequencing technologies etc. The overall objective of the course is train the students to improvise the understanding of algorithms used in Bioinformatics and also make students to write novel algorithms to improvise speed and accuracy in biological problem solving.

Course Outcomes:

Students will be able to:

1. Understand the details of the algorithms commonly used in bioinformatics.
2. Identify which type of algorithm is best suited to describe a given biological problem.
3. Develop bioinformatics prediction algorithms describing a given biological problem.
4. Implement and develop prediction tools on a detailed level using the following algorithms: Dynamic programming, Sequence clustering, Weight matrices.

SKILLS ACQUIRED:

- ✓ Develops logical thinking to analyse biological problems
- ✓ Integration of computational programme to fetch answers for biosystems
- ✓ Dynamic programming skills will be implemented to develop robust programmes.

ACTIVITIES:

- ✓ Constructing a programme to identify ORF
- ✓ Develop a programme for phylogenetic tree analysis
- ✓ Constructing a programme to find structure- function relationship of a protein.

UNIT – I

INTRODUCTION: Algorithms and Complexity, Biological algorithms versus computer algorithms, Iterative versus Recursive Algorithms, Big-O Notations, and Algorithm design techniques.

UNIT - II

GREEDY ALGORITHMS: Exhaustive Search, Mapping Algorithms, Greedy Algorithms, Approximation Algorithms

UNIT - III

DYNAMIC PROGRAMMING ALGORITHMS: DNA Sequence comparison, Global Sequence Alignment, Scoring Alignment, Local Sequence Alignment, Alignment with Gap Penalties, Multiple Alignment.

UNIT - IV

GRAPH ALGORITHMS: DNA Sequencing, Fragment assembly in DNA Sequencing, Protein Sequencing and Identification.

UNIT - V

CLUSTERING AND TREES: Gene expression analysis, Evolutionary Trees, Character-based tree reconstruction - Small and large Parsimony Problem.

Text Books:

16BT456 MOLECULAR MODELING AND DRUG DESIGN

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course provides an overall understanding about the critical relationship among bimolecular structure, function and force field models. The main objective of this course is to train students to utilize basic modeling techniques to explore biological phenomena at the molecular level.

Course Outcomes:

- ✓ Upon successful completion of this course, the students will be able to:
- ✓ Students will be introduced to the principles and practice of molecular modeling and modern drug discovery.
- ✓ They will gain an awareness of rational drug design ,based on understanding the three-dimensional structures and photochemical properties of drugs and receptors will be created.
- ✓ They will be able to perform monto carlo simulation.
- ✓ They will be able to predict the stru
- ✓ cture of protein by Threading
- ✓ They will acquire fundamental principles of chemiinformatics

SKILLS ACQUIRED:

- ✓ Navigate molecular graphics.
- ✓ Estimate energy minimization upon docking.
- ✓ Perform linking of enzymes to other molecules or substrates for commercial applications.
- ✓ Simulate 3D structures of proteins and enzymes.
- ✓ Rational prediction of on-target and off-target effects

ACTIVITIES:

- ✓ Visualize tertiary protein using CN3D tool.
- ✓ Retrieve protein structures.
- ✓ Predict basic secondary structure.
- ✓ CADD-computer assisted drug design.
- ✓ Perform structure and ligand based drug design.

UNIT - I

Introduction to Molecular Modelling: Introduction Useful Concepts in Molecular Modelling: Coordinate Systems. Potential Energy Surfaces. Molecular Graphics. Surfaces. Computer Hardware and Software.

UNIT - II

Force Fields: Force Fields. Bond Stretching. Angle Bending. Introduction to Nonbonded Interactions. Electrostatic Interactions. Van der Waals Interactions. Hydrogen Bonding in Molecular Mechanics. Force Field Models for the Simulation of Liquid Water.

UNIT - III

Energy Minimisation and Computer Simulation : Energy Minimisation and Related Methods for Exploring the Energy Surface. Non Derivative method, 1^{st} and 2^{nd} order minimization methods. Computer Simulation Methods. Simple Thermodynamic Properties and Phase Space. Boundaries. Analyzing the Results of a Simulation and Estimating Errors. GROMACS.

UNIT - IV

Molecular Dynamics & Monte Carlo Simulation : Molecular Dynamics Simulation Methods. Molecular Dynamics Using Simple Models. Molecular Dynamics with Continuous Potentials. Molecular Dynamics at Constant Temperature and Pressure. Metropolis Method. Monte Carlo Simulation of Molecules.

UNIT - V

Structure Prediction and Drug Design: Protein Structure Prediction Introduction to Comparative Modeling. Constructing and Evaluating a Comparative Model. Molecular Docking (AUTODOCK). Drug design: Structure based, De Novo Ligand design.

BIOTECHNOLOGY

16BT253 ALGAL BIOTECHNOLOGY

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Course Outcomes:

The students will be able to:

- ✓ Acquaint with principles, technical requirement, scientific and commercial applications in algal biotechnology.
- ✓ Be familiar with sterile algal media preparation
- ✓ Gain knowledge of how algae can be cultivated for industrial applications
- ✓ Support methodologies in culture of algae for food, feed and nutraceutical purpose
- ✓ Be motivated to set goals towards pursing gradate school and higher level positions such as algal biotechnologists, and key scientist in algal biotechnology research institutes and industries.

SKILLS ACQUIRED:

- ✓ Maintenance of the sterility of the algal culture laboratory
- ✓ Preparation of media composition
- ✓ Grow algae for biomass production
- ✓ Analyze high value compounds in algal biomass.

ACTIVITIES:

- ✓ Measuring the growth of algae.
- ✓ Analyze biomass yield and pigments such as chlorophylls and carotenoids in micro algal culture.
- ✓ Visit to algal biotechnology company to understand the commercial algal cultivation systems.

UNIT - I

Introduction of algae; classification of algae; role of algal biotechnology in India, and its importance in various industries

UNIT - II

Overview of *Spirulina*, *Dunaliella; Haematococcus,* and *Chlorella;* Chemical composition (protein; amino acids, lipids, vitamins, pigments, and phycobiliproteins) of *Spirulina*, *Dunaliella; Haematococcus,* and *Chlorella.*

UNIT - III

Basic algal culture techniques: Isolation and purification techniques; factors (pH, temperature, light intensity, photoperiod, nutrients, mixing, etc) effects on algal growth.

UNIT - IV

Basic algal cultivation; culture of algae in raceway ponds and photobioreactors; strain selection; types of raceway ponds; types of photobioreactors; advantages of raceway and photobioreactors; downstream processing of algae; types of harvesting methods, cell disruption method; product isolation and purification methods.

UNIT - V

Commercial applications of algae (*Spirulina, Haematococcus and Dunaliella*) in nutraceutical and pharmaceutical industry; general characteristics of algae; Nutritional value, Pharmaceutical properties.

16BT362 PLANT BIOTECHNOLOGY

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

It is dedicated to research plant tissue culture and cell culture mediated production of different plants through Micropropogation and transgenic production. Plant biotechnology in food Industry, nutritional composition; secondary metabolite pathway engineering with special focus on caffeine in coffee plants; elicitation of secondary metabolites in plants for augmenting food value metabolites such as flavor compounds; biomolecules of nutritional and nutraceutical importance from under utilized fruits. This course is completely based on the outcome of plant research. It studies regeneration and multiplication of endangered plants, Development of transgenic plants for biotic and abiotic stress. Applications of the molecular markers in plant biotechnology, Development of food formulations; value added products from plant sources.

Course Outcomes:

- ✓ Acquaint with principles, technical requirement, scientific and commercialization of Plant tissue culture.
- ✓ It gives the detailed description on plant tissue culture technique
- ✓ It gains the knowledge in development of transgenic plants and its applications
- ✓ The methodologies for the elicitation of secondary metabolites in plants for augmenting food value metabolites such as flavor compounds
- ✓ It will motivate the students to select for the research in molecular marker technology.

SKILLS ACQUIRED:

- ✓ Micro propagation and organogenesis of plants.
- ✓ Gene constructs and Gene transfer by prokaryotic and eukaryotic vectors.
- ✓ Plant Breeding.

ACTIVITIES:

- ✓ Handling of plant tissue culture techniques
- ✓ Standardization and Development. transgenic plants.
- ✓ Isolation of secondary metabolite from food additive and flavored plants.

UNIT – I

Introduction of plant biotechnology in Agriculture; Pest resistant plants; herbicide resistance; disease and stress resistant plants; transgenic crops with improved quality traits. Role of plant biotechnology in food industry-secondary metabolites in plants for augmenting food value metabolites; edible vaccines and value added products from plant sources e.g. *Coffee, Stevia, Vanilla, Annatto and beetroot*.

UNIT – II

Biotechnological approaches for plant development**.** Micro propagation and organogenesis of plants. Composition of plant tissue culture media; media preparation for plants; growth factors on plant tissue culture. Hormone requirement; hormones effects on plant growth. Plant tissue culture techniques: Somatic embryogenesis; protoplast fusion and Somaclonal variation

UNIT – III

Plant transformation technology; Gene constructs and Gene transfer by prokaryotic and eukaryotic vectors. Agrobacterium-mediated transformation and Gene gun methods for transgenic production, Selection of transgenics - marker and reporter genes. Gene silencing: RNAi and its applications for crop.

UNIT – IV

Molecular biological confirmation by Gel electrophoresis; PCR; Restriction Mapping; DNA Sequencing, Southern, Northern and Western blotting. Tools and techniques of molecular markers in genetic engineering, restriction endonucleases, DNA Fingerprinting (RAPD), SSRs, ESTS and TILLING technique.

UNIT – V

Principles of Plant Breeding: Introduction to plant breeding. Basic features of plant breeding and Objectives of plant breeding. Plant Breeding Methodologies; Sources of Plant genetics resources and conservation strategies. Breeding for nutritional improvement, Nutritional quality, Improved protein content and Improved oil quality.

16BT363 MEAT, POULTRY, FISH AND DAIRY TECHNOLOGY

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course deals with the technology involved in the processing and storage of the various food products originating from meat, fish, poultry and dairy. The safety issues associated with these products will also be emphasised. Furthermore this course provides background information with respect to: (1) **Product development** of added value products (2) Selection of meaningful parameters for **Sensory evaluation** (3) Appropriate **utilization of ingredients** from other commodities such as Dairy and Grain products in meat (fish, poultry and egg) products and (4) Understanding of product and process **food microbiology**.

Course Outcomes:

The students will be able to:

- ✓ **Develop** Process Flow Diagrams for products studied, and thereby describe the process and in particular be able to give a technical justification for the steps in the process
- ✓ **Discuss and associate** raw material characteristics, formulations, handling and processing procedures with quality, yield and cost of product produced and in most cases safety
- ✓ **Analyse** the processes studied and identify the control points for quality and in most cases safety. For these control points you should be able to recommend appropriate parameters (and limits)
- ✓ **Critically evaluate** processes for their effectiveness with respect to product quality, yield

SKILLS ACQUIRED:

- ✓ Mechanical deboning of meat
- ✓ Preservation and processing of poultry products
- ✓ Handling of fresh water fish.

ACTIVITIES:

- ✓ Proximate analysis of meat, poultry, fish samples.
- ✓ Estimation of protein from meat, poultry, fish samples.
- ✓ Visit to fish processing units to understand various processing methods.

UNIT – I

Meat: Sources of meat and meat products in India; Chemical composition and microscopic structure of meat; Effect of feed, breed and management on meat production and quality; Slaughtering of animals and poultry, inspection and grading of meat; Mechanical deboning, meat tenderization; Meat plant sanitation and safety; by product utilization.

UNIT – II

Poultry: Classification, composition, preservation methods and processing; Structure, composition, nutritive value and functional properties of eggs and its preservation by different methods; Processing of egg products; Factors affecting egg quality and measures of egg quality.

UNIT – III

Fishery: Types of fish – composition & structure; post-mortem changes in fish; Handling of fresh water fish; Canning, smoking, freezing and dehydration of fish; Preparation of fish products, fish sausage and home makings; Fish processing industries in India.

UNIT – IV

Milk Processing: Milk processing flow sheet – Filtration / clarification; Storage of milk; Pasteurization – types of pasteurization process; Manufacture of dairy products: Cream, Butter, Ghee, Milk powder & Cheese

UNIT – V

Manufacture of Ice Cream and other dairy products: Manufacture of Ice cream – Chemistry and technology – Microbiology of ice cream – Quality aspects; Manufacture of paneer, Toned Milk, Sweetened condensed milk, Khoa; Fermented dairy products – Yoghurt, curd, butter milk.

16BT455 NANO TECHNOLOGY IN AGRICULTURAL AND FOOD INDUSTRIES

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

It refers to the science of integration between biology and nanotechnology. This usually uses biological systems to devise technical aspects for the development of novel products. Nanobiotechnology as defined in broad terms an interdisciplinary field, that includes fields such as diverse as molecular biology and molecular bio-chemistry. Nanobiotechnology basically relies on the idea of producing products that can integrate into the organisms system whereby effectively carry out the function it was meant for. Ideally two main strategies are being employed in this study on nanobiotechnology: top-down and bottom-up. Whereas in one molecular components are being integrated into an assembly, other forms the basis of forming nano scale particles from larger molecules.

This course combines physical laws, chemical procedures and biological principles on the nano-scale and enrich the students with important applications in a range of fields like medical diagnosis, drug delivery, detection of bio-macromolecules in complicated biochemical systems etc.

Course Outcomes:

- ✓ This course will give a general description about Nanomaterials based on their dimensionality.
- ✓ It gives the information about importance of reduction in materials dimensionality, and its relationship with materials properties.
- ✓ This course will give a general description about Nanomaterials based on their dimensionality.
- ✓ Imparts an understanding of approaches for Nanomaterial fabrication & Nanotechnology tools.
- ✓ Imparts an understanding of approaches for Nanomaterial fabrication & Nanotechnology tools.
- ✓ Gives an insight into the use of Nanotechnology in biomedical, microelectronics and optical applications.

SKILLS ACQUIRED:

- ✓ Prepare nanoparticles from organic oils.
- ✓ Charaterize nanoparticles by analytical and imaging systems.
- ✓ Evaluate safety of nanoparticles on cell lines.

ACTIVITIES:

- ✓ Synthesis and characterization of Nano particles
- ✓ Applications and modeling of Nanobiosensors
- ✓ Toxicity effects through different models

UNIT – I

Introduction: Scope and Overview, Length scales , Importance of Nanoscale and Technology, History of Nanotechnology, Future of Nanotechnology: Nano Technology Revolution, Silicon based Technology, Benefits and challenges in Molecular manufacturing: The Molecular assembler concepts.

UNIT – II

Nano Particles : Introduction, Types of Nanoparticles. Techniques to Synthesize Nanoparticles, Characterization of Nanoparticles, Toxic effects of Nanomaterials, Importance of Nanobiotechnology and its role in plants and microbial production, Nanobiotechnology role in functional foods, food production and Safety Assessment of Nano-materials in Foods.

UNIT – III

Nanobiosensor, Nano tubes and Nanowires and Nanofluids. Nanocrystals in biological detection, Electrochemical DNA sensors, Nano-Biodevices and Systems. Atomic Force Microscopy, Significance of Nanoparticles Nanofabrications- MEMS/NEMS. High through put DNA sequencing with nanocarbon tubules.

UNIT – IV

Nanomedicine : In-vivo drug delivery system. Artificial neurons, Applications in cancer biology, Synthetic retinyl chips based on bacteriorhodopsins. Future nanomachine and High Nanosurgical devices.

UNIT – V

Ethical Issues in Nanotechnology: Introduction, Socioeconomic Challenges, Ethical Issues in Nanotechnology With special Reference to Nanomedicine and its Application in Nonmedical Contexts. Nanotechnology and Future Socio - economic Challenges.

BIOMEDICAL ENGINEERING

16BM208 BASIC CLINICAL SCIENCES

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Clinical sciences gives a perceptive to students on various aspects of clinical diseases and the measurable parameters for diagnosis and gives a view on instruments for treatment and other assistive devices.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the clinical significance of diseases.
- ✓ Know basic hospital instruments in various departments and critical units.

SKILLS ACQUIRED:

- ✓ Gain knowledge on basic diseases.
- ✓ Know the diagnosis or treatment methodology.

ACTIVITIES:

- ✓ Make a prototype of de-firillator
- ✓ Make a model of diseased Kidney
- ✓ Model a diseased colon.

UNIT - I

NEPHROLOGY: Principles of dialysis; Haemodialysis, Acetate dialysis, Bicarbonate dialysis. Peritonial dialysis, chronic ambulatory peritoneal dialysis, Haemoperfusion, Sequential ultra-filtra-tion. Hemofiltration, Adequacy of dialysis, Clearance, dialysance, Components of dialyzing system, Dialysate, composition of dialysate, Types of dialyzers, controls and monitoring devices for dialyzers. Clinical significance. Renal transplantation: Basic principles.

UNIT - II

NEUROLOGY: NEUROLOGY: Diseases of nervous system, spinal cord lesions, motor nervous disease, prolapsed intervertebral disc, Neuropathies, Myasthenia gravis, Diseases of muscle.

.

UNIT - III

CARDIOLOGY: Electro cardiography: Source of ECG potentials: Dipole theory, conduction system, Normal and abnormal ECG's. Diagnostic applications, interpretation of ECG, Basic Introduction to Cardiac assistive devices, Heart lung machine.

GASTROENTEROLOGY: Anatomy and Physiology and G.I.T diseases: Stomach (ulcers), Liver (jaun-dice), Gall Bladder (gall stone). Disease diagnosis and treatment. Juices-Gastric, Bile, Pancreatic, Intestinal, including their functions and clinically significant symptoms-signs, diseases, instruments used in Gastroenterology.

UNIT - IV

GENERAL SURGERY:

Surgical Patient, Clinically significant Investigations. Preoperative care, Post-operative care and. Consent by patient. Study of operation of surgical equipments, Laparoscopy, Endoscopy and Intuba-tion tubes.

UNIT - V

PATHOLOGY& BLOOD BANK: Blood Bank: Blood groups. ESR. Electrolyte-estimation of normal val-ues. HIV test-ELISA, Dot Method. Cross matching of blood. Cell counter. Normal blood coagulation factors. Normal bilurubin.

TEXT BOOKS:

16BM303 BIOMEDICAL INSTRUMENTATION

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	46	6	12	3	2

Course Description and Objectives:

This course includes the basic and advanced principles, concepts, and operations of medical sensors and devices, the origin and nature of measurable physiological signals and also including design of electronic instrumentation. this course aimed at to impart the knowledge of realistic design and experimentation with amplifiers for bio potential measurements and therapeutic instrumentation such as pacemakers, defibrillators and prosthetic devices.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ construct instrumentation systems.
- ✓ acquire and process different physiological signals.
- ✓ use the display devices and recorders are also considered.
- ✓ gain the knowledge about analytical instruments and their working features long with their medical applications.

SKILLS ACQUIRED:

- ✓ Study of biomedical instrumentation and their parameters.
- ✓ Study of different display devices.
- ✓ Determination of bio potentials and how they are interpreted.
- ✓ Extraction of biological signals and feeding them to instruments to make meaning out of it.

ACTIVITIES:

- ✓ Analyze ECG signals via simulators.
- ✓ Differentiate abnormalities using bio amplifiers
- ✓ Build and test circuits.
- ✓ Analyze Medical chemicals using spectrophotometers, flame photometers.

UNIT - I

Introduction to Medical Instrumentation: Block diagram of a medical instrumentation system; Bio-signals: Origin and characteristics of Bio potentials-ECG, EEG, EGG, EMG, ENG, EOG, and ERG; Problems encountered with measurements from human beings; Generalized medical instrument specifications, Electrode-Electrolyte Interface, Half-cell potential, Offset Voltage; Types of Electrodes- External, Internal and Microelectrodes; Mathematical Treatment of Electrodes- Equivalent circuits and Applications.

UNIT - II

Medical Display Devices and Recorders: Display Devices- Basic requirements for the dis-play and recording of Bio-signals, Types of medical display devices; Medical recorders: Classification of recorders, PMMC writing systems; General features of ink-jet, Thermo-sensitive and optical recorders; Oscilloscopes: Basic description, Cathode Ray Oscilloscope (CRO), Dual beam oscilloscope, Analog storage oscilloscope, Digital storage oscilloscope, Medical, Multibeam and Non-fade display systems; Liquid crystal displays- Introduction, Passive-matrix and active, matrix addressed LCDs.

UNIT - III

Cardiac Instrumentation: Electrocardiography, Block diagram, Circuits, electrodes and their placement; Lead configuration and general ECG waveforms; ECG monitors: Single channel and multi-channel ECG systems, Holter monitors, Stress test systems; Blood Pressure measurement- Introduction to blood pressure, Direct and indirect methods of Blood Pressure measurements; Blood Flow measurement: Introduction to hemodynamics, Electromagnetic and Ultrasonic techniques of Blood flow measurement; Heart sounds- Origin of Heart Sounds, Types of microphones for heart sound measurement, Contact and non-contact type of measurement, Phonocardiography.

UNIT - IV

Neuro-Muscular Instrumentation: Electroencephalography- EEG-Block diagram and circuits, Electrodes and their placement, Lead configuration and general EEG graphs; Evoked potentials and their measurement, Filters for EEG rhythm analysis, Electromyography: Introduction to EMG signals, EMG-Block diagram and Circuits-Electrodes and their placement; Nerve conduction velocity determination using EMG, Stimulators for EMG recording.

UNIT - V

Medical Analytical Instrumentation: Methods of chemical analysis, Absorption Photometry, emission photometry, Flurometry, Colorimeter, Spectrophotometer, Flame photometer, Mass spectrophotometer, Electrophoresis, chromatography, Blood gas analyzer, Semi and fully automated analyzers.

16BM342 ASSIST DEVICES

Hours Per Week:

L	T	P	C
3	-	-	3

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

This course imparts knowledge of the various mechanical techniques that will help failing heart. The objectives of this course is to learn the functioning of the unit which does the clearance of urea from the blood and know the various orthotic devices and prosthetic devices to overcome orthopedic problems.

.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Explain the functioning and usage of electromechanical units which will restore normal functional ability of particular organ that is defective temporarily
- ✓ Understand the tests to assess the hearing loss and development of electronic devices to compensate for the loss.
- ✓ Understand electrical stimulation techniques used in clinical applications.

SKILLS ACQUIRED:

- ✓ Know the devices used for artificial functioning of organ system.
- ✓ Gain knowledge on Filtration techniques involved in the kidneys.
- ✓ Determine the criticality involved in the hearing loss.
- ✓ Know the learning processes a patient can go through if the he's put under assist devices.

ACTIVITIES:

- ✓ Analyze the principle of external counter pulsation techniques.
- ✓ Analyze implantation of prosthetic heart valves.
- ✓ Test process involved in the audiological process.
- ✓ Ascertain the need for implants for knee and selection of materials on them.

UNIT - I

Cardiac Assist Devices: Principle of External counter pulsation techniques, Intra aortic balloon pump, Auxiliary ventricle and schematic for temporary bypass of left ventricle, Prosthetic heart valves.

UNIT - II

Hemodialysers: Artificial kidney, Dialysis action, Hemodialyser unit, Membrane dialysis, Portable dialyser monitoring and functional parameters.

UNIT - III

Hearing Aids: Common tests – Audiograms, Air conduction, Bone conduction, Masking techniques, SISI, hearing aids – Principles, Drawbacks in the conventional unit, DSP based hearing aids.

UNIT - IV

Prosthetic and Orthodic Devices: Hand and arm replacement – different types of models, externally powered limb prosthesis, feedback in orthodic system, functional electrical stimulation, sensory assist devices.

UNIT - V

Recent Trends: Transcutaneous electrical nerve stimulator, Bio-feedback,etc..

16BM343 TISSUE ENGINEERING

Hours Per Week:

L	T	P	C
48	-	-	3

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	30	6	12	3	2

Course Description and Objectives:

This course focuses on the analysis Introduction of Tissue Engineering Cell cycle and differentiation Basics about stem cells and its applications; Different synthetic and biomaterials in tissue replacements and Application of Tissue Engineering

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Explain cell migration mechanisms.
- ✓ Explain the different types of medicinal delivery systems
- ✓ Apply principles in regenerative medicine and engineering.

SKILLS ACQUIRED:

- ✓ Know the objectives of tissue engineering.
- ✓ Determine for cell culture.
- ✓ Study the application principles in tissue engineering.

ACTIVITIES:

- ✓ Determine biomaterials and suitable polymers for tissue engineers.
- ✓ Analyze the mechanism for artificial organs growing.

UNIT - I

Fundamentals of Tissue Engineering: Tissue exchange and tissue development - Objectives of tissue engineering - Laboratory set up for tissue engineering, Cell cycle and differentiation, Cell adhesion - Cell adhesion molecules, Cell migration, Cell aggregation and Tissue equivalent.

UNIT - II

Stem Cells: Definition of stem cells, Types of stem cells, Differentiation, Dedifferentiation maturation, Proliferation, Pluripotency and immortalization, Sources of stem cells-Hematopoietic, Fetal, Cord blood, Placenta, Bone marrow, Primordial germ cells, Cancer stem cells, Induced pluripotent stem cells.

UNIT - III

Components of Tissue Engineering: Cell and Drug delivery systems, Transplantation, Implantation, Synthetic components, Nanotechnology in tissue engineering, Imaging methods-SEM, TEM, Fluorescent and Confocal microscopy.

UNIT – IV

Materials in Tissue Engineering: Biological materials, Degradable and non-degradable, Extra cellular matrix, Decellularization, Polymers- Synthetic and natural, Cell interaction with polymers, Applications of polymer.

UNIT – V

Application of Tissue Engineering: Replacement Engineering, Artificial organs– Cartilage, Skin blood, Pancreas, Kidney and Liver, Regenerative engineering- Nerve regeneration, Cardiac tissue regeneration, Muscle regeneration.

16BM401 DIAGNOSTIC AND THEREPEUTIC EQUIPMENTS-II

Hours Per Week:

L	T	P	C
3	-	-	3

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	6	12	3	2

Course Description and Objectives:

This course explains the concepts about human-instrument system and problems encountered in obtaining measurements from a living body. It also deals with basics of measuring the parameters in respiratory system, learn measurement techniques of sensory responses and understand different types and uses of diathermy units. It also gives knowledge of ultrasound imaging techniques and diagnosis..

Course Outcomes:

Upon successful completion of this course, the students will be able to:

1. know the importance of patient safety against electrical hazard
2. explain about measurements of parameters related to respiratory system
3. describe the measurement techniques of sensory responses
4. analyze different types and uses of diathermy units
5. discuss ultrasound imaging techniques and its usefulness in diagnosis
6. outline the importance of patient safety against electrical hazard

SKILLS ACQUIRED:

- ✓ outline the importance of patient safety against electrical hazard.
- ✓ Determine diagnostic techniques used in health care.
- ✓ Will know the principles in transmission of bio signals in telemetry.
- ✓ Understand procedures for safely carrying out therapeutic process

ACTIVITIES:

- ✓ Analysis of principles behind holter monitoring, defibrillators and other monitoring systems.
- ✓ To develop new therapeutic equipment in hospital management.
- ✓ Understand sources of leakage current and method of monitoring it.
- ✓ Analyse the criticality of an instrument and trouble shoot it economically.

UNIT - I

Respiratory Measurement Ststem: Instrumentation for measuring the mechanics of breathing,Spiro meter - Lung Volume and vital capacity, Measurements of residual volume, pneumotachometer, Airway resistance measurement, Whole body plethysmography, Intra-Alveolar and Thoracic pressure measurements, Apnea Monitor; Types of Ventilators – Pressure, Volume, Time controlled; Flow, Patient Cycle Ventilators, Humidifiers, Nebulizers, Inhalators.

UNIT - II

Sensory Measurement: Psycho Physiological Measurements for testing and sensory Responses, Electro occulograph, Electro retinograph, Audiometer-Pure tone, Speech; EGG (Electrogastrograph), galvanic skin resistance (GSR).

UNIT - III

Diathermy: IR and UV lamp and its application, Short wave diathermy, Ultrasonic diathermy, Microwave diathermy, Electro surgery machine - Current waveforms, Tissue Responses, Electro surgical current level, Hazards and safety procedures.

UNIT – IV

Ultrasonic Technique: Diagnosis, Tissue Reaction, Basic principles of Echo technique, Display techniques A, B and M mode, B Scan, Application of ultrasound as diagnostic tool, Echocardiogram, Echoencephalogram, Abdomen, Obstetrics and Gynecology, Ophthalmology.

UNIT – V

Patient Safety: Physiological effects of electricity, important susceptibility parameters, Macro shock, Micro shock hazards, Patient’s electrical environment, Isolated Power system, Conductive surfaces, Electrical safety codes and standards, Basic Approaches to Protection against shock, Protection equipment design, Electrical safety analyzer, Testing the Electric system.

16BM308 MEDICAL IMAGING TECHNIQUES

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	46	6	12	3	2

Course Description and Objectives:

This course studies the image reconstruction techniques, quality assurance test for radiography, method of recording sectionalimage, functioning of radioisotopic imaging equipment and the MRI, image acquisition and reconstruction, it also explains the 3-D image display techniques. This course aimed at imparting knowledge of operation and medical applications of the major medical imaging techniques.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

1. explain the basic principles of the major medical imaging techniques
2. explain the mode of operation and medical applications of the major medical imaging techniques
3. understand the advantages and disadvantages of the major imaging techniques, includ-ing potential hazards for patients.

SKILLS ACQUIRED:

- ✓ Study the physics behind medical imaging.
- ✓ Determine the basis for an image is formation.
- ✓ Know the image formation in MRI.
- ✓ Grasp the knowledge of CT and importance of a medical department.
- ✓ Image acquisition and processing of images for required model.

ACTIVITIES:

- ✓ Know the processes involved in different image acquisition techniques.
- ✓ Attain knowl-edge on particle interaction with biological tissue.
- ✓ Calculate dose limits and differentiate between controlled areas and radiation hazards.

UNIT - I

Basic Medical Imaging Modalities: X-ray, CT , Ultrasound, MRI, PET-CT, SPECT-CT, Gamma Cam-era, Catheterization Lab. Aspects of light imaging, convolutions and transforms, photometry lenses and depth of field, Image perception and 3D Imaging, Image acquisition, Display, Image processing operations, scanning & segmentation.

UNIT - II

Basic Concepts of CT : Non Spiral CT technology, Concepts of Spiral CT Scanner ,Multi Slice spiral technology , Various Peripheral devices. Applications: Multiplanar Reconstruction, Maximum Intensity Projection, 3D, CT Angio, Osteo , Dental, Perfusion (Body & Neuro), Virtual Endoscopy, Cardiac CT (Calcium scoring, Coronary Angiography, Lesion Quantification).

UNIT - III

Magnetic Resonance Imaging: Permanent & Super conducting magnets, Signal generation and detection, signal characteristics, signal localization, Fourier transforms in MRI, Imaging Reconstruction. Image artifacts. Coil technology, Parallel acquisition techniques, Various peripheral devices. Applications: Functional Imaging, Perfusion & Diffusion imaging (Echo planar imaging), Multi direction diffusion tensor imaging, Single & Multi Voxel Spectroscopy, MR Angiography, MRCP, Cardiac MRI (Myocardium viability, Valve function etc.,) Flow Quantification.

UNIT – IV

Ultrasound Scanner: Principles of Ultrasound, Basic Ultrasound instrumentation, Imaging techniques A mode, B Mode, 2B, B/M, 4B , Gated Mode, 3D, 4D, M-Mode, Echocardiography) Image recording devices, Image artifact, Biological effects.

UNIT – V

Gamma Camera: Physics of Gamma camera, basic Instrumentation, Imaging techniques, SPECT & Whole Body studies; Applications of Gamma camera in Cardiology, Nephrology, Neurology etc., PET : Fundamentals of PET scanner & PET- CT , Crystal technology, Cyclotron principle, Hot Lab equipments, Applications of PET ; Cardiology, Neurology & Cardiology.

Text Books:

COMPUTER SCIENCE ENGINEERING

16CS246 LINUX/UNIX AND SHELL PROGRAMMING

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Student explore to Unix/Linux operating system utilities like file processing, process management, disk management, networking and ability to write the shell program for specific task.

Course Outcomes:

- Installing several Linux distributions on direct hardware setup and virtual hardware setup
- Managing files and directives
- Knowing process attributes and basic level of process management
- Able to write shell script for given operating system task

SKILLS ACQUIRED:

- ✓ File and process manipulation
- ✓ Design and develop shell script programs.

UNIT – I

Introducing the Unix and Linux Operating System: A Brief History of Unix, Linux and Unix, Installing Linux, Introducing Unix/Linux shells, Logging into Unix/Linux, Basic commands: date, cal, who, clear, man, whatis.

UNIT – II

Understanding Unix/Linux File System: Exploring the Root Hierarchy, Using paths, Pathnames, and Prompts, pwd, Navigating the file system, cd, ls, mkdir, cp, rm, chmod, Usage of Vi editor.

UNIT – III

Unix/Linux file Processing: Input/output redirection, manipulating files- cat, touch, mv, find, paste, cut, sort, join, Advanced file processing: Selection commands-pipe, comm., diff, head, tail, wc, uniq, grep, sed.

UNIT – IV

Introduction to shell script programming: The program development lifecycle, variables, shell operators, redirection operators, more about wild card characters, shell logic structure, sequential logic, decision logic.

UNIT – V

Shell Script looping logic, the while loop, case logic, using shell functions, exploring the unix/Linux utilities- df, du, finger, ps, uname, ifconfig, ping, netstar, Installing application and packages in Linux.

Text Book:

2. Behrouz A. Forouzan, Richard F. Gilbery, "Unix and shell Programming", 1^{st} Edition, Cengage Learning India, 2003.

16CS351 R-PROGRAMMING

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

- ✓ Be familiar with the use of the R interactive environment
- ✓ Expand R by installing R packages
- ✓ Understand the different data types, data structures.
- ✓ Use control statements, user-defined functions, Loop constructs
- ✓ Be able to expand their knowledge of R on their own.

Course Outcomes:

At the end of this course, students will be able to:

- ✓ Motivation for learning a programming language.
- ✓ Learn to Install Rstudio and work on R interface.
- ✓ Learn the basics of R programming including objects, classes, vectors, attributes etc.
- ✓ Write functions including generic functions using various methods and loops.
- ✓ Select and modify values as required.
- ✓ Cover the concepts of R Notation, S3 System and Closures.
- ✓ Access online resources for R and import new function packages into the R workspace.
- ✓ Become proficient in writing a fundamental program and perform analytics with R.

ACTIVITIES:

- ✓ Store, retrieve, and change data values in your computer's memory
- ✓ Use R programming tools such as if else statements, for loops, and S3 classes
- ✓ Learn how to write lightning-fast vectorized R code.
- ✓ Take advantage of R's package system and debugging tools
- ✓ Practice and apply R programming concepts as you learn them.

UNIT – I

INTRODUCTION: Install R & Rstudio, Opening R, The R User Interface, Objects, Functions, Sample with Replacements, Writing Your Own Functions, The Function Constructor, Arguments, Scripts. R Objects**:** Atomic Vectors, Attributes, Matrices, Arrays.

UNIT – II

R Objects & R Notations: Class, Coercion, Lists, Data Frames, Loading Data, Saving Data. R Notation**:** Selecting Values, Deal a Card, Shuffle the Deck, Dollar Signs and Double Brackets.

UNIT - III

Modifying Values & Programs: Changing Values in Place, Logical Subsetting: Logical Tests, Boolean Operators, Missing Information: na.rm, is.na, Programs: Strategy, Sequential Steps, Parallel Cases, if Statements, Else Statements, Lookup Tables, Code Comments.

UNIT – IV

S3 & Loops: The S3 System, Attributes, Generic Functions, Methods: Classes S3 and Debugging, S4 and R5.Loops: Expected Values, expand.grid, for Loops, while Loops, repeat Loops.

UNIT – V

R Packages & Loading and Saving Data in R: R Packages: Installing Packages, Loading Packages. Loading and Saving Data in R: Data Sets in Base R, Working Directory

TEXT BOOK:

1. Garrett Grolemund "Hands-on Programming with R", 1st Edition, 2014.
2. Roger D. Peng "R Programming for Data Science"

REFERENCE BOOKS:

1. R Cookbook, Paul Teetor, O'Reilly.
2. R in Action, Rob Kabacoff, Manning
3. The R Book, Michael J. Crawley, WILEY, 2012.

LABORATORY EXPERIMENTS :

List of Experiments:

1. Installation of R software and R studio IDE
2. R Notations, Basic Operations
3. Programs which demonstrates R Objects: Data and Object types, Sub setting rules Atomic Vectors.
4. Experiment to Factor the data
5. A program to perform basic matrix operations such as addition, subtraction, dot product, multiplication Matrices,
6. Row binding and column binding operations using Arrays,
7. Converting matrices in to Data Frames
8. Control Structures: Logical Operators, If Statements, If-else Statements.
9. Programs which demonstrates Loops: For Loop, While Loop.
10. Writing user defined Functions for basic operations such as factorial, prime number etc.

16CS353 STATISTICS USING PYTHON

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

- The job of a data scientist is to glean knowledge from complex and noisy datasets.
- Reasoning about uncertainty is inherent in the analysis of noisy data. Probability and Statistics provide the mathematical foundation for such reasoning.
- After acquiring data and getting them into a form to work with, you ultimately want to make clear, succinct conclusions from them, on the principles of statistical inference.
- In this course, student will start building the foundation to think statistically, to speak the language of data, to understand what they are telling.
- In this course, you will do just that, expanding and honing your hacker stats toolbox to perform the two key tasks in statistical inference, parameter estimation and hypothesis testing.

UNIT – I

- **Pandas:** Data Structures for Statistics-Data Handling- Grouping-
- **Statsmodels:** Tools for Statistical Modeling
- **Seaborn:** Data Visualization-General Routines
- **Data Input**
- Input from Text Files-Visual Inspection-Reading ASCII-Data into Python-
- Input from MS Excel
- Input from Other Formats- Matlab
- **Display of Statistical Data**
- Data types - Categorical-Numerical
- Plotting in Python-Functional and Object-Oriented Approaches to Plotting-Interactive Plots-Displaying Statistical Datasets-Univariate Data-Bivariate and Multivariate Plots.

UNIT – II

Distributions and Hypothesis Tests

- **Discrete Distributions** - Bernoulli Distribution - Binomial Distribution - Poisson Distribution
- **Normal Distribution**-Examples of Normal Distributions-Central Limit Theorem-Distributions and Hypothesis Tests
- **Continuous Distributions** Derived from the Normal Distribution-t-Distribution-Chi-Square Distribution-F-Distribution
- **Exponential Distribution-Uniform Distribution**
- **Hypothesis Tests**
- **Typical Analysis Procedure** - Data Screening and Outliers - Normality Check-Transformation-**Hypothesis Concept, Errors, p-Value, and Sample Size**-Generalization - The Interpretation of the p-Value -Types of Error-Sample Size-
- **Sensitivity and Specificity** -Related Calculations

UNIT – III

- **Tests of Means of Numerical Data**-Distribution of a Sample Mean -One Sample t-Test for a Mean Value-Wilcoxon Signed Rank Sum Test-Comparison of Two Groups -Paired t-Test--t-Test between Independent Groups.
- **Comparison of Multiple Groups**-
- Analysis of Variance (ANOVA)-Multiple Comparisons-Kruskal–Wallis Test
- **Two-Way ANOVA**
- **Selecting the Right Test for Comparing Groups-Typical Tests-Hypothetical** Examples
- **Tests on Categorical Data** -One Proportion - Confidence Intervals-Explanation-
- **Frequency Tables** – One - Way Chi-Square Test – Chi - Square Contingency Test

Unit – IV

Statistical Modeling

- **Linear Regression Models**-Linear Correlation- Correlation Coefficient-Rank Correlation
- **General Linear Regression Model**-Example : Simple Linear Regression-Example : Quadratic Fit-Coefficient of Determination
- **Patsy: The FormulaLanguage**- Design Matrix
- **Linear Regression Analysis with Python**-Examples : Line Fit with Confidence Intervals-Noisy Quadratic Polynomial
- **Model Results of Linear Regression Models**-Example: Tobacco and Alcohol in the UK-Definitions for Regression with Intercept-The R^2 Value- R^2 : The Adjusted R^2 Value-Model Coefficients and Their Interpretation-Analysis of Residuals-Outliers-Regression Using Sklearn.

Unit – V

- **Multivariate Data Analysis**
- **Visualizing-Multivariate Correlations**- Scatterplot Matrix-Correlation Matrix
- **Multilinear Regression**
- **Tests on Discrete Data**
- Comparing Groups of Ranked Data -Logistic Regression
- Generalized Linear Models : Exponential-Family of Distributions- Linear Predictor and Link Function-Ordinal Logistic Regression-Problem Definition-Optimization-Code-Performance
- **Bayesian Statistics**: Bayesian vs Frequentist Interpretation -Bayesian Example - The Bayesian Approach in the Age of Computers - Example: Analysis of the Challenger Disaster with a Markov-Chain–Monte-Carlo Simulation

Text Book:

1. An Introduction to Statistics with Python With Applications in the Life Sciences, Thomas Haslwanter - Springer- ISSN 1431-8784 - ISBN 978-3-319-28315-9 Springer International Publishing Switzerland 2016.

16CS446 DATA SCIENCE USING PYTHON

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Through this Data Science with Python course, students will learn how to process, clean, visualize and analyze data by using Python, one of the most popular data science tools. Students will learn cutting edge Machine Learning techniques in Python. Post the course learners will become an in-demand Data Scientists

Course Outcomes:

Students are able to:

- ✓ Learn how to analyze large amounts of data to bring out insights
- ✓ Get knowledge on relevant examples and cases make the learning more effective and easier
- ✓ Gain hands-on knowledge through the problem solving based approach of the course along with working on the skill set at the end of the course

SKILLS ACQUIRED:

- ✓ Learn to apply data science methods and techniques, and acquire analysis skills.
- ✓ Basic data manipulation & data cleaning using Python and pandas Regular Expressions

UNIT – I

Introduction to data science, Python basics, Data processing using arrays, file input/output with arrays.

UNIT – II

Introduction to pandas data structure, computing descriptive statistics, essential functionality, Handling missing data.

UNIT – III

Reading and writing data with text format, Binary data formats, interacting with HTML and web API's.

UNIT – IV

Combing and merging data sets, data transformation and string manipulation.

UNIT – V

Date and time data types and tools, Time series basics, Time zone handling.

Test Book:

16CS247 FUNDAMENTALS OF DATABASE SYSTEMS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course presents an introduction to database management systems with an emphasis on how to organize, maintain and retrieve data efficiently and effectively from a database. It concentrates on requirements gathering and conceptual, logical, physical database design. The objective of the course is to make the student to understand database management concepts such as database design, transaction processing and query optimization **Course Outcomes:**

Students are able to:

The student will be able to:

- ✓ Understand the basic concepts of relational data model, entity-relationship model, relational database design, relational algebra and SQL.
- ✓ Design Entity Relationship(ER) models to represent simple database application scenarios.
- ✓ Convert the ER-model to relational tables, populate relational database and formulate SQL queries.
- ✓ Construct simple queries using Structured Query Language (SQL).
- ✓ Improve the database design by normalization.
- ✓ Familiarize with basic database storage structures and access techniques.

SKILLS ACQUIRED:

- ✓ Design a conceptual database using ER-Model.
- ✓ Convert ER- Model to RDBMS.
- ✓ Formulate database queries using Structured Query Language (SQL).
- ✓ Build and run DDL and DML commands.
- ✓ Design and implement normalized databases.
- ✓ Construct B+ Trees.

ACTIVITIES:

- ✓ Design of ER diagram for the development of web applications.
- ✓ Transformation of ER diagram into a relational schema.
- ✓ Creation of relations with entity and referential integrity constraints for a given relational schema
- ✓ Formulation of queries using SQL.
- ✓ Design of relational database using normalization techniques.
- ✓ Development of relational schema for enterprise level web applications.

UNIT – I

Introduction to Databases: Advantages of using the DBMS approach, Data Models, Schemas and Instances, Three-Schema Architecture and Data Independence, DBMS Structure.

UNIT – II

Conceptual Designed Database Design: High-Level Conceptual Data Models for Database Design, A Sample Database Application, Entity Types, Entity Sets, Attributes and Keys, Relationship Types, Relationship Sets, Roles and Structural Constraints, Weak Entity Types, Refining the ER Design for the Company Database, ER Diagrams, Naming Conventions and Design Issues.

UNIT – III

Relational Datamodeland SQL: Relational Database Design Using ER-to-Relational Mapping, Relational Model Concepts, Relational Model Constraints and Relational Database Schemas, SQL Data Definition and Data Types, Specifying Constraints in SQL, Basic Retrieval Queries in SQL, INSERT, DELETE and UPDATE Statements in SQL, Relational Algebra.

UNIT – IV

Database Design Theory and Normalization: Informal Design Guidelines for Relation Schemas, Functional Dependencies, Normal Forms Based on Primary Keys, General Definitions of Second and Third Normal Forms, Boyce-Codd Normal Form, Properties of Relational Decompositions.

UNIT – V

Transaction Processing, Concurrency Control and Recovery: Transaction and System Concepts, Desirable Properties of Transactions, Two-Phase Locking Techniques, Single level and Multilevel indexes, Dynamic Multilevel Indexes Using B+ Trees.

LABORATORY EXPERIMENTS

Course Outcomes:

The student will be able to:

- ✓ Understand, analyze, and apply common SQL Statements including DDL, DML and DCL
- ✓ Statements to perform different operations.
- ✓ Design and implement a database for a given problem.

LIST OF EXPERIMENTS

1. ER Design tool (ex. TOAD)
2. MYSQL RDBMS
3. DDL Commands
4. DML Commands
5. DCL and TCL Commands
6. Database design of any Enterprise application with key constraints
7. Nested Queries and Join Queries.
8. Views.
9. Design and development of database using MYSQL.

TEXTBOOK:

16CS245 ADVANCE DATABASES

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course presents an introduction to Distributed database systems with an emphasis on how to organize, maintain and retrieve data efficiently and effectively from a database. It concentrates on data fragmentation, allocation, transparencies and efficiency of distributed database design. The objective of the course is to make the student to understand distributed database systems concepts such as distributed database design, distributed transaction processing and distributed query optimization.

Course Outcomes:

The student will be able to:

- ✓ Understand the basic concepts of distributed database systems, fragmentation, allocation and replication, database design, relational algebra and SQL.
- ✓ Design of distributed database of any enterprise application scenarios.
- ✓ Familiarize with basic distributed query processing and optimization techniques.

SKILLS ACQUIRED:

- ✓ Design a distributed database.
- ✓ Performing various Fragmentations of distributed databases
- ✓ Applying Distributed query processing techniques
- ✓ Familiarize the distributed recovery protocols

ACTIVITIES:

- ✓ Familiarize with basic distributed query processing and optimization techniques.
- ✓ Design of distributed database of any enterprise application scenarios.
- ✓ Development of distributed database for enterprise level web applications.
- ✓ Application of distributed recovery protocols.
- ✓ Application of distributed query processing.

UNIT - I

Review of Database Systems : Evolution of Distributed Database System, Overview of Parallel Processing Systems, Parallel Database Design.
Overview of Computer Networking: Introduction to Networking, Types of Computer Networks, Communication Schemes, Network Topologies, the OSI Model.
Distributed Database concepts: Fundamentals of Distributed databases, Features of a Distributed DBMS, Advantages and Disadvantages of Distributed DBMS, An example of Distributed DBMS, Homogeneous and Heterogeneous Distributed DBMSs, Functions of Distributed DBMS, Components of Distributed DBMS.

UNIT – II

Distributed Database Design: Distributed Database design concepts, Objectives of Data Distribution, Data Fragmentation, The Allocation of Fragments, Transparencies in Distributed Database design.
Distributed DBMS Architecture: Introduction, Client/Server System, Peer to Peer Distributed System, Multi Database System (MDBS)

UNIT - III

Distribution Transaction Management--- Basic concepts of Transaction management, ACID Properties of Transaction, Objectives of Distributed Transaction Management, A Model for Transaction Management in a Distributed System, Classifications of transaction.

UNIT – IV

Distributed concurrency control: Objectives of Distributed concurrency control, concurrency control Anomalies, Distributed Serializability, Classification of Concurrency control Techniques, Locking based concurrency control Protocols.
Distributed Recovery Management: Introduction to recovery Management, Failures in a Distributed Database System, Steps followed after a failure, Local recovery Protocols, Distributed Recovery Protocol.

UNIT - V

Overview of Query Processing and Optimization.
Distributed Query Processing : Concepts of query processing, Objectives of distributed query processing, Phases in Distributed Query Processing, Join Strategies in Fragmented Relations.
Data Warehousing and Data Mining : Concepts of Data Warehousing, Data Warehousing Architecture, Introduction to Data Mining, Data Mining Techniques.

Course Description and Objectives:

This course introduces the concepts and techniques of knowledge discovery and data mining. It also focuses on issues relating to the feasibility, usefulness, effectiveness and scalability of techniques for the discovery of patterns hidden in *large data sets*. The objective of this course is to apply the techniques of clustering, classification, association finding, feature selection and visualization of real world data

Course Outcomes:

The student will be able to:

- ✓ describe various kinds of data sets used for analysis
- ✓ illustrate various methods used for data cleaning
- ✓ apply data mining techniques for crucial decision making
- ✓ identify the necessity of correlation analysis for association mining
- ✓ examine various clustering techniques in data mining

SKILLS ACQUIRED:

- ✓ Perform in depth analysis of information requirements for solving problems;
- ✓ Manage large databases;
- ✓ Deploy knowledge in decision support systems or intelligent systems, both in academic and in industrial environments.
- ✓ Design data warehouse for an organization.

UNIT – I

Introduction DataWarehousing and Mining : Why Data Mining, What is Data Mining, Kinds of Data, Kinds of Patterns, and Technologies used, Kinds of applications adopted, Major issues in Data Mining.

UNIT – II

About Data & Data Preprocessing : Data Objects and Attribute Types, Basic Statistical Descriptions of Data, Measuring Data Similarity and Dissimilarity. Data Preprocessing, An Overview, Data Cleaning, Data Integration, Data Reduction, Data Transformation and Data Discretization

UNIT – III

Mining Concepts : Mining Frequent Patterns, Associations, and Correlations, Basic Concepts and Methods: Basic Concepts, Frequent Itemset Mining Methods, Which Patterns Are Interesting?—Pattern Evaluation Methods

UNIT – IV

Classification : Basic Concepts, Decision Tree Induction, Bayes Classification Methods, Rule-Based Classification, Model Evaluation and Selection, Techniques to Improve Classification Accuracy. Advanced Classification - Classification by Back propagation, Support Vector Machines.

UNIT – V

Cluster Analysis :
Cluster Analysis, Partitioning Methods, Hierarchical Methods, Density-Based Methods, Grid-Based Methods, Evaluation of Clustering.

Text Book:

1. Jiawei Han Micheline Kamber – “Data Mining Concepts & Techniques”, Third Edition, Morgan Kaufmann Publishers, 2012.

Reference Books :

1. Pang-Ning Tan, Michael Steinbach, Vipin Kumar, “Introduction to Data Mining”, First Edition, 2012.
2. Ralph Kimball, Margy Ross, “The Data Warehouse Toolkit”, first edition John Wiley and Sons Inc., 2002.

16CS447 INTRODUCTION TO BIGDATA ANALYTICS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

The main objectives of this course is to enable the students with basic data analytic skills like regression analysis, classification techniques, clustering techniques, association rule mining. Further, this course also enables the students how to scale the above algorithms with different data environments like massive amount of data, streaming data, distributed data and provides hands on experience on real world problems using above theoretical background

Course Outcomes:

- ✓ Necessary theory background for processing analytics.
- ✓ Processing analytics on small scale data.
- ✓ Mining from massive datasets.
- ✓ Mining from distributed datasets.

SKILLS ACQUIRED:

- ✓ Develop programming and analytics for various statistical problems using R.
- ✓ Design classification models for various standard and user Datasets.
- ✓ Develop clustering techniques and association rules for large standard and user
- ✓ Datasets.
- ✓ Analyse large scale data using MAPREDUCE programming which includes JAVA and HADOOP frameworks.

ACTIVITIES:

- ✓ Familiarize with basic distributed query processing and optimization techniques.
- ✓ Design of distributed database of any enterprise application scenarios.
- ✓ Development of distributed database for enterprise level web applications.
- ✓ Application of distributed recovery protocols.
- ✓ Application of distributed query processing.

UNIT – I

Introduction to Big Data : Introduction to BigData Platform – Traits of Big data -Challenges of Conventional Systems - Web Data – Evolution Of Analytic Scalability – Analytic Processes and Tools - Analysis vs Reporting - - Statistical Concepts: Sampling Distributions - Re-Sampling - Statistical Inference - Prediction Error.

UNIT – II

Data Analysis : Regression Modeling - Multivariate Analysis - Bayesian Modeling - Inference - Support Vector and Kernel Methods - Analysis of Time Series: Linear Systems Analysis - Nonlinear Dynamics - Rule Induction - Neural Networks: Learning.

UNIT – III

Advanced Learning and treaming: Generalization - Competitive Learning - Principal Component Analysis and Neural Networks - Fuzzy Logic: Extracting Fuzzy Models from Data – Fuzzy c-Means- Stochastic Search Methods. Introduction to Streams Concepts – Stream Data Model and Architecture - Stream Computing - Sampling Data in a Stream – Filtering Streams

UNIT – IV

Frequent Itemsets and Clustering : Mining Frequent Itemsets - Market Based Model – AprioriAlgorithm, FP-Growth, Dynamic Item set Algorithm – Clustering Techniques – Hierarchical – KMeans, K-medoid, CURE- Clustering High Dimensional Data – CLIQUE– Clustering in Non-Euclidean Space – Clustering for Streams and Parallelism.

UNIT – V

Frameworks and Visualization : Map Reduce – Hadoop, Hive, MapR – Sharding – NoSQL Databases - S3 - Hadoop Distributed File Systems – Visualizations - Visual Data Analysis Techniques - Interaction Techniques; Systems and Analytics Applications.

16CS352 JAVA PROGRAMMING

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course intended to develop software that covers the principles of object oriented programming which includes defining class, creating objects, usage of abstraction, encapsulation, inheritance and polymorphism. Further, it offers concepts of multi-threading and exception handling.

Course Outcomes:

· The student will be able to:

- ✓ Distinguish between procedures oriented and object oriented concepts of programming.
- ✓ Understand OOP concepts and features of Java language.
- ✓ Apply Object Oriented concepts in problem solving.

SKILLS ACQUIRED:

- ✓ Data hiding and abstraction
- ✓ Code reusability
- ✓ Create new packages and interfaces
- ✓ Develop multi-threaded applications
- ✓ Runtime error handling
- ✓ Parallel programming

.

ACTIVITIES:

- ✓ Implementing the concept of encapsulation.
- ✓ Design a sample program which exhibits inheritance
- ✓ Developing a program which implements polymorphism
- ✓ Implementing a program for multithreading

UNIT – I

Introduction: Creation of Java, Importance of Java to Internet, Byte code, Java buzzwords, OOP principles, Encapsulation, Inheritance and polymorphism, Compiling and running of simple Java program, Data types, Variables, Declaring variables, Dynamic initialization, Scope and life time of variables, Arrays, Operators, Control statements, Type conversion and casting.

UNIT – II

Classes and Objects: Concepts of classes and objects, Class fundamentals, Declaring objects, Assigning object reference variables, Introducing methods, Constructors, Usage of static with data and methods, Usage of final with data, Access control, This key word, Garbage collection, Overloading methods and constructors, Call by value, Recursion, Nested classes and inner classes.

UNIT – III

Inheritance: Basic concepts, Member access rules, Usage of super key word, Forms of inheritance, Method overriding, Abstract classes, Dynamic method dispatch, Using final with inheritance.

UNIT – IV

Packages and Interfaces: The object class, Defining, Creating and accessing a package, Understanding classpath, Importing packages, Differences between classes and interfaces, Defining an interface, Implementing interface, Applying interfaces, Variables in interface and extending interfaces.

UNIT – V

Exception Handling, Multi Threading: Concepts of exception handling, Types of exceptions, Usage of try, Catch, Throw, Throws and finally keywords, Built-in exceptions, Creating own exception, Sub classes, Concepts of multithreading, Differences between process and thread, Thread life cycle, Creating multiple threads using thread class, Runnable interface, Synchronization, Thread priorities, Inter thread communication.

Text Books:

1. Herbert Schildt, "The Complete Reference Java J2SE", 9th edition, TMH Publishing Company Ltd, New Delhi, 2008.

Reference Books:

1. Cay Horstmann, "Big Java", 2nd edition, John Wiley and Sons, 2006.

2. O'Reilly, "Head First JAVA", 2nd edition, O'Reilly Media Inc, 2005

3. Herbert Schildt, "A Beginner's Guide", 6th edition, McGraw Hill Education, 2014.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS

1. Develop a program to read an integer and print all prime numbers upto that integer.
2. Develop a program that checks whether a given string is a palindrome or not.
3. Develop a program toArrange given list of names in the ascending order.
4. Develop a program for addition of two matrics.
5. Develop a program for finding largest number in an array.
6. Develop a program to demonstrate class,object and constructor
7. Develop a program to demonstrate static keyword.
8. Develop a program to demonstrate inheritence
9. Develop a program to demonstrate polymorphism
10. Develop a program for creating a package and usage of user define package
11. Develop a program to demonstrate exception handling.
12. Develop a program to demonstrate multi threading.

16CS355 INTERNET TECHNOLOGIES

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

On completion of this course, a student will be familiar with client server architecture and able to develop a web application using java technologies. Students will gain the skills and project-based experience needed for entry into web application and development careers. Students will be able to use a variety of strategies and tools to create websites and also integrate with IDE's for fast development of web applications.

Course Outcomes:

- ✓ Students are able to develop a dynamic webpage by the use of java script and DHTML.
- ✓ Students will be able to write a well formed / valid XML document.
- ✓ Students will be able to connect a java program to a DBMS and perform insert, update and delete operations on DBMS table.
- ✓ Students will be able to write a server side java application called Servlet to catch form data sent from client, process it and store it on database.
- ✓ Students will be able to write a server side java application called JSP to catch form data sent from client and store it on database.

SKILLS ACQUIRED:

- ✓ Perform client side validation using Java script.
- ✓ Store and retrieve data using JDBC.
- ✓ Generate dynamic contents using Servlets.
- ✓ Generate dynamic contents using JSPs.
- ✓ Overcome problems in Servlets and JSP using Struts Programs.
- ✓ Develop a working system of web application or web site.

UNIT – I

Tier Architecture & **HTML :** Client/Server Architecture**,** J2EE Multi Tier Architecture. HTML Common tags- Block Level and Inline Elements, Lists, Tables, Images, Forms, Frames; Cascading Style sheets, CSS Properties;

UNIT – II

Java Script & XML : Introduction to Java Script, Objects in Java Script, Dynamic HTML with Java Script. The Need for XML, SGML and XML, Well-Formed XML, Valid XML, Displaying XML, XML Application Languages, Document type definition, XML Schema.

UNIT – III

JDBC : Data Base, Database Schema, A Brief Overview Of The JDBC Process, JDBC Driver Types, JDBC Packages, Database Connection, Associating The JDBCODBC Bridge With Database, Creating, Inserting, Updating And Deleting Data In Database Tables, Result Set, Metadata.

UNIT – IV

Web Servers and Servlets : Tomcat web server, Introduction to Servlets: Servlets, the Advantage of Servlets over "Traditional" CGI, Basic Servlet Structure, Simple Servlet Generating Plain Text, Compiling and Installing the Servlet, Invoking the Servlet, Lifecycle of a Servlet, The Servlet API, Reading Servlet parameters, Reading Initialization parameters, Context Parameters, Handling Http Request & Responses, Using Cookies-Session Tracking, Servlet with JDBC.

UNIT – V

JSP : The Problem with Servlet. The Anatomy of a JSP Page, JSP Processing, JSP Application Development: Generating Dynamic Content, Using Scripting Elements, Implicit JSP Objects, Declaring Variables and Methods , Sharing Data Between JSP pages, Users Passing Control and Data between Pages, JSP application design with JDBC, JSP Application Design with MVC.

16CS448 PYTHON PROGRAMMING

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course is aimed at offering the fundamental concepts of Python scripting language to the students. It starts with the basics of python programming and deal with lists, dictionaries, functions, exceptions and files. The objective of this course is to enable the students to develop the applications using the concepts of python.

Course Outcomes:

· Student will be able to

- ✓ Understand the basic terminology used in computer programming to write, compile and debug programs in python language
- ✓ Use different data types to design programs involving decisions, loops, and functions.
- ✓ Handle the exceptions which are raised during the execution of python scripts.
- ✓ Understand the usage of files and classes.

SKILLS ACQUIRED:

- ✓ Identify suitable data types of an application
- ✓ Apply control statements for decision making problems.
- ✓ Design an application to perform various operations using class
- ✓ Create a list of data and perform operations on data and result is stored on file

ACTIVITIES:

- ✓ Implement of data types such as scalars, arrays, lists using Python.
- ✓ Develop functions using Python.
- ✓ Copy the content of one file into another.
- ✓ Perform operations such as display, calculate percentage, add, delete and modify student data.
- ✓ Implement matrix operations.

UNIT – I

Introduction: History of Python Features of Python, Python Installation on Windows & LINUX, Running Python Scripts, Variables, Assignment, Keywords, Input-Output, Indentation.

UNIT – II

Types, Operators and Expressions: Types - Integers, Strings, Booleans; Operators- Arithmetic Operators, Comparison (Relational) Operators, Assignment Operators, Logical Operators, Bitwise Operators, Membership Operators, Identity Operators, Expressions and order of evaluations.

Control Flow: if, elif, else, for, while, break, continue, pass

UNIT – III

Data Structures: Lists - Operations, Slicing, Methods; Tuples, Sets, Dictionaries, Sequences. Comprehensions.

UNIT – IV

Functions - Defining Functions, Calling Functions, Passing Arguments, Keyword Arguments, Default Arguments, Variable-length arguments, Anonymous Functions, Fruitful Functions (Function Returning Values), Scope of the Variables in a Function - Global and Local Variables. **Modules:** Creating modules, import statement, from. Import statement, name spacing,

Error and Exceptions Difference between an error and Exception, Handling Exception, try except block, Raising Exceptions.

UNIT – V

Files: Opening and Closing files, reading and writing, tell (), seek(), rename ()

Object Oriented Programming OOP in Python: Classes, Methods, Constructor Method, Inheritance, Overriding Methods.

Text Books

1. Python Programming: A Modern Approach, Vamsi Kurama, Pearson
2. Learning Python, Mark Lutz, Orielly (files)

Reference Books

1. Think Python, Allen Downey, Green Tea Press
2. Core Python Programming, W.Chun, Pearson.
3. Introduction to Python, Kenneth A. Lambert, Cengage

LIST OF EXPERIMENTS:

Exercise 1 – Basics

a) Running instructions in Interactive interpreter and a Python Script

b) Write a program to purposefully raise Indentation Error and Correct it

Exercise 2 – Operations

a) Write a program to compute distance between two points taking input from the user (Pythagorean Theorem)

b) Write a program add.py that takes 2 numbers as command line arguments and prints its sum.

c) Read two integers and perform all arithmetic operations on those two numbers.

Exercise - 3 Control Flow

a) Write a Program for checking whether the given number is a even number or not.

b) Using a for loop, write a program that prints out the decimal equivalents of 1/2, 1/3, 1/4, . . . 1/10

c) Write a program using a for loop that loops over a sequence. What is sequence ?

d) Write a program using a while loop that asks the user for a number, and prints a countdown from that number to zero.

Exercise 4 - Control Flow – Continued

a) Find the sum of all the primes up to given range.

b) Each new term in the Fibonacci sequence is generated by adding the previous two terms. By Starting with 1 and 2, the first 10 terms will be: 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, ...

c) By considering the terms in the Fibonacci sequence whose values do not exceed one lakh, find the sum of the even-valued terms.

Exercise - 5 - DS

a) Write a program to count the numbers of characters in the string and store them in a dictionary data structure

b) Write a program to use split and join methods in the string and trace a birthday with a dictionary data structure.

c) Create a dictionary of student data and search for a student.

Exercise - 6 DS - Continued

a) Write a program combine lists that combines these lists into a dictionary.

b) Write a program to count frequency of characters in a given file. Can you use character frequency to tell whether the given file is a Python program file, C program file or a text file?

Exercise - 7 Files

a) Write a program to print each line of a file in reverse order.

b) Write a program to compute the number of characters, words and lines in a file.

c) Handle divide by zero exception.

Exercise - 8 Functions

a) Write a function ball_collide that takes two balls as parameters and computes if they are colliding. Your function should return a Boolean representing whether or not the balls are colliding.

   Hint: Represent a ball on a plane as a tuple of (x, y, r), r being the radius

   If (distance between two balls centers) <= (sum of their radii) then (they are colliding)

b) Find mean, median, mode for the given set of numbers in a list.

Exercise - 9 Functions - Continued

a) Write a function nearly_equal to test whether two strings are nearly equal. Two strings a and b are nearly equal when a can be generated by a single mutation on b.

b) Write a function dups to find all duplicates in the list.

c) Write a function unique to find all the unique elements of a list.

Exercise - 10 - Functions - Problem Solving

a) Write a function cumulative product to compute cumulative product of a list of numbers.

b) Write a function reverse to reverse a list. Without using the reverse function.

c) Write function to compute gcd, lcm of two numbers. Each function shouldn't exceed one line.

Exercise 11 - Multi-D Lists

a) Write a program that defines a matrix and prints

b) Write a program to perform addition of two square matrices

c) Write a program to perform multiplication of two square matrices

Exercise - 12 OOP

a) Class variables and instance variable

   i) Robot, (ii) ATM Machine, (iii) Create a class called Student and perform operations such as display, calculate percentage, add, delete and modify student data.

CIVIL ENGINEERING

16CE281 RENEWABLE ENERGY RESOURCES

Hours Per Week:

L	T	P	C
3	1	0	4

Total Hours:

L	T	P
45	15	-

Course Description and Objectives:
The main objective of this course is to make the student aware of the various renewable energy resources that leads for sustainable use of energy and directly leads to sustainable development for sustainable cities

Course Outcomes:

- ✓ Knowledge of Various types of energy resources.
- ✓ Efficient use of energy resources
- ✓ Uses of renewable energy

SKILLS ACQUIRED:

- ✓ Use of solar radiation to produce electricity
- ✓ Use of wind energy to produce electricity
- ✓ Collection and conversion of bio waste into bio gas

ACTIVITIES:

- ✓ Prepare a Solar Plate model for LED lighting
- ✓ Prepare a model of wind mill and produce some electricity
- ✓ Collect and convert the bio waste into bio gas
- ✓ Write a technical report on any Thermal and Hydel power plants in India.
- ✓ Write a technical report on Geo thermal energy.

UNIT – I

Principles of Solar Radiation: Role and Potential of New and Renewable source, the solar energy option, Environmental impact of solar power, Physics of the Sun, The solar constant, Extraterrestrial and Terrestrial solar radiation, solar radiation on titled surface, Instruments for measuring solar radiation and sun shine, solar radiation data.

UNIT – II

Solar Energy Collection & Applications: Flat Plate Collectors and Concentrating Collectors, Classification of concentrating collectors, Orientation and Thermal analysis, advanced collectors, Solar ponds, Solar Energy Applications - solar heating/cooling techniques, solar distillation and drying, Photovoltaic Energy Conversion.

UNIT – III

Wind Energy: Sources and potentials, Horizontal and Vertical axis wind mills - Types, Blade Design, Performance characteristics, Betz criteria, Induction Generators for Wind power Generation, MHD Generation.

UNIT – IV

BIO-Mass & DEC: Principles of Bio-Conversion, Anaerobic/aerobic digestion, Types of Bio-gas Digesters, gas yield, Combustion characteristics of bio-gas, Utilization for cooking, Economic aspects. Direct Energy Conversion, Need for DEC, Principles of DEC, Carnot Cycle and Limitations.

UNIT – V

Harnessing Geothermal Energy & Ocean Energy: Resources of Geothermal Energy, Types of wells, Methods of harnessing the energy, potential in India, Ocean Thermal Energy Conversion, Principles, Utilization, Setting of OTEC plants, Thermodynamic cycles, Tidal and Wave energy: Potential and Conversion Techniques, Mini-Hydel Power plants.

Text Books :

1. Non-Conventional Energy Sources by G.D.Rai, Khanna Publishers.
2. Renewable Energy Resources by Twidell and Wier, CRC Press (Taylor and Francis).
3. Non- Conventional energy resources by B.H.Khan, Tata Mc Graw-Hill, 2006.

Reference Books :

1. Renewable Energy Resources by Tiwari and Ghosal, Narosa.
2. Renewable Energy Technologies by Ramesh and Kumar, Narosa.
3. Non-Conventional Energy Systems by K Mittal, Wheeler Publishing House.
4. Renewable Energy Sources and Emerging Technologies by D.P.Kothari, K.C.Singhal, PHI.

16CE385 ENVIRONMENTAL POLLUTION AND CONTROL

Hours Per Week:

L	T	P	C
3	1	0	4

Total Hours:

L	T	P
45	15	-

Course Description and objectives:

The course has been designed to improve the understanding about different pollution control strategies and the skills of application of remediation techniques to combat pollution in four environmental compartments i.e. air, water, noise and soil. The course will also be dealing about the sources of pollution in air, soil, water, solid-waste and noise and the impacts these sources on the environment and health. In addition, the students will be given the training to develop the particular skills required in pollution related structured research

Course Outcomes:

Students will be able to:

- ✓ Recognize, evaluate, and control factors in the workplace and the environment that cause health and environmental hazards and utilize quantitative knowledge and skills and modern tools and
- ✓ Technologies to access, analyze, plan, control and implement environmental management systems

SKILLS ACQUIRED:

- ✓ Estimate the Ambient Air Quality Standards
- ✓ Estimate the Water Quality Standards
- ✓ Estimate the Soil Quality Standards
- ✓ Estimate the Noise Quality Standards
- ✓ Find out Control Measures of Pollution

ACTIVITIES:

1. Classify different types of air pollutants and its effect on environment in your local area and suggest necessary steps to control
2. Classify different types of water pollutants and its effect on environment in your local area and suggest necessary steps to control
3. Classify different types of soil pollutants and its effect on environment in your local area and suggest Necessary steps to control
4. Classify different types of e -wastes and its effect on environment in your local area and suggest Necessary steps to control

Introduction to Environmental Pollution: Definition and sources of pollution; Types of Pollutants and their classification. Different types of pollution and their global, regional and local aspects. Air Pollution: Types and sources of air pollutants; Aerosols; Characterization of aerosols Effects of pollutants on human beings, plants, animals and materials. Air quality management.

UNIT II

Water Pollution: Sources of pollution of surface and ground water, Water pollution parameters – physical, chemical and biological; Types of water pollutants; Effects of water pollution on water bodies - eutrophication, aquatic life, vegetation and human health; Control of water pollution.

UNIT III

Soil Pollution: Sources, effects and control of soil pollution. Pollution and residual toxicity from the application of insecticides, pesticides and fertilizers.Municipal solid waste Definition - Sources and types of solid waste- composition and its determinants of Solid waste-factors influencing generation-quantity assessment of solid wastes-methods of sampling and characterization. Collection transfer, control and management of Municipal Solid Waste, Landfills.

UNIT IV

Noise Pollution: Noise pollution – source, measurement, effects and control; Thermal pollution: Definition and sources, Chemical and biological effects of thermal pollution, Effect on marine life, bacteria and water quality and other aquatic biota; Thermal pollution from power plants and their control.

UNIT V:

Electronic waste (E-waste): Sources and types, constituents of E-wastes, recycling of ewaste and its environmental consequences, Management of e-wastes, Basel convention. Radiation Pollution: Radioactive decay; Interaction of radiation with matter; Biological impact and health hazards associated with radiation, Protection against ionizing isotopes; Radioactive waste disposal.

TEXT BOOKS

1. Environmental Pollution B.K. Sharma S.H. Kaur Goel Publishing House
2. Dr. M. Anji Reddy, “A Text book of environmental science and Technology”, B S Publications, 2008

REFERENCE BOOKS

16CE391 PRINCIPLES OF INDUSTRIAL WASTE TREATMENT

Hours Per Week:

L	T	P	C
3	1	0	4

Total Hours:

L	T	P
45	15	-

Course Description and objectives:

The course has been designed to improve the understanding about different industrial waste water treatment technologies. In addition, the students will be able to describe the physical, chemical, and biological processes necessary for designing and managing primary, secondary, tertiary and advanced wastewater treatment processes and solids handling systems

Course Outcomes:

Students will be able to:

- ✓ To understand and apply the fundamental principles of industrial wastewater treatment and management
- ✓ To know the chemical, physical, and biological processes necessary for designing and managing modern wastewater treatment plants.

SKILLS ACQUIRED:

- ✓ Designing treatment technology for waste water from various industries
- ✓ Estimate the Water Quality Standards of various industries
- ✓ Demonstrate a basic understanding of water and wastewater treatment principles, and associated operations and maintenance considerations

ACTIVITIES:

1. Visit any Industry and estimate the characteristics of wastes.
2. Estimate the effect of Industrial waste in your area and plan effluent treatment plant.
3. Design any oxidation pond in your area.
4. Discuss about waste reduction techniques
5. Visit any dairy near your area and estimate the waste and propose treatment method.

UNIT–I

Principles of Industrial Waste Treatment: Introduction, Principles of industrial waste management, sources of pollution, physical, chemical, organic and biological properties, effects of waste water on self purification capacity of streams, land environment and human health, characteristics of treatment plant effluents, Effect of waste water

UNIT–II

Principles of biological waste treatment: Facilities Microbiological growth rate kinetic equations, sludge production, oxygen requirements, and continuous flow treatment models. Aerobic treatment studies in continuous and semi-continuous reactors. Anaerobic treatment, studies, Nitrogen and Phosphorus removal.

UNIT–III

Process designs of the following units w.r.t. Industrial Wastes; Activated sludge process; trickling filter; sludge digestion units; Aerated lagoons; Stabilization ponds (oxidation ponds); oxidation ditches (Pasveer); Rotating Biological contactor; Anaerobic filter.

UNIT– IV

Principles of Industrial waste Treatment: Waste reduction pretreatment of wastes, collection and segregation of wastes, reduction in volume and strength neutralization; equalization; proportioning.

UNIT–V

Manufacturing processes, flow sheets; Characteristics and treatment of wastes and disposal methods of the following industries – Sugar, Dairy, Distillery, Paper, Tannery, Textile, Sheet, Fertilizer, Oil refinery and Petrochemicals. Wastes from food processing, hospitality Industries and Hospitals. Legislation framework and regulation in India; EPA, NGT and Case Studies

TEXTBOOKS:

1. Industrial Waste Management, M.N. Rao and A.K. Datta
2. Metcalf and Eddy; A waste water Engineering Treatment, disposal and Reuse –Tata Mc. Graw-Hill Co., 3rd edition, 1995.

REFERENCES:

1. Standard methods for examination of Water and waste water, APHA, American Water work Association, Water pollution control federation, New York.
2. Waste and waste water technology, Mark, JH. John Wiley and Sons, New York.

16CE482 ENVIRONMENTALIMPACT ASSESSMENT

Hours Per Week:

L	T	P	C
3	1	0	4

Total Hours:

L	T	P
45	15	-

Course Description and Objective:

The course is designed to know the various environmental aspects like assessment of soil, surface water environment, impact of air pollution, which are essential to consider before establishment of any civil engineering projects at a particular location. It also deals with different legislative acts and environment audits regarding selection of location of the project.

Course Outcomes: ·

- ✓ Identify the environmental attributes to be considered for the EIA study · Formulate objectives of the EIA studies ·
- ✓ Identify the methodology to prepare rapid EIA · Prepare EIA reports and environmental management plans

SKILLS ACQUIRED:

- ✓ Knowledge of Environmental Impact Assessment and Methods to assess.
- ✓ Assessment of Environmental Pollution Impact on soil and groundwater
- ✓ Assessment of Air pollution Impact
- ✓ Knowledge of Environmental Audit and Environmental legislation
- ✓ Knowledge of pollution, water, air and wild life protection act.

ACTIVITIES:

1. Write a technical report on EIA and its methodologies with examples
2. Write a technical report to assess soil and ground water impact.
3. Write a technical report to assess air pollution
4. Write a brief report on Water and Air pollution act.
5. Write a brief report on Wild life protection act.

UNIT – I

Basic concepts of EIA : Initial Environmental Examination; Elements of EIA; Factors affecting EIA; Impact evaluation and analysis; Preparation of Environmental Base map; Classification of Environmental parameters. EIA Methodologies; Introduction; criteria for the selection of EIA Methodology; EIA Methods: Ad-hoc methods, Matrix methods, Network method, Environmental media quality index method; Overlay methods; Cost/benefit Analysis.

UNIT – II

Impact of Developmental Activities and Land Use: Introduction and Methodology for the assessment of soil and ground water; Delineation of study area; Identification of activities. Procurement of relevant soil quality; Impact prediction; Assessment of Impact significance; Identification and Incorporation of mitigation measures.

UNIT – III

EIA in surface water, Air and Biological Environment: Methodology for the assessment of Impacts on surface water environment; Air pollution sources; Generalized approach for assessment of Air pollution Impact. Assessment of Impact of Development activities on vegetation and wildlife; Environmental Impact of Deforestation; Causes and effects of deforestation. Coastal regulations and Use of R.S and GIS

UNIT – IV

Environmental Audit and Environmental legislation : Objectives of Environmental Audit; Types of Environmental Audit; audit protocol; stages of Environmental Audit; On-site activities; Evaluation of Audit data and preparation of Audit report.

UNIT – V

Post Audit activities; The Environmental Pollution Act, The Water Act; The Air (Prevention and Control of Pollution) Act; Wild life protection Act. Case Studies and preparation of Environmental Impact Assessment statement for various industries.

ELECTRONICS & COMUNICATION ENGINEERING

16EC270 - EMBEDDED LINUX

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
15	38	5	15	3	-

Course Description and Objectives :

This course offers fundamental concepts of Linux programming, compiling, libraries and other basic tools for testing and debugging. The objective of this course to provide the studnet with the concepts of kernel programming and developing embedded applications with Linux.

Course Outcomes :

The student will be able to :

- ✓ Use GNU-C Programming tool chain in Linux.
- ✓ Understand Linux kernel and scheduling concepts of Linux operating systems.
- ✓ Build embedded system applications using Linux operating systems.
- ✓ Use testing and debugging tools in Linux.

SKILLS ACQUIRED:

- ✓ Operate Linux with command line interface.
- ✓ Identify tools required to build a kernel.
- ✓ Identify tools required for testing and application development.
- ✓ Recognize how a process is scheduled.
- ✓ Identify Inter process communication in Linux.
- ✓ Test the application with GNU tools.

ACTIVITIES:

- ✓ Choose a kernel for a Cell-phone/Laptop for various embedded applications.
- ✓ Test the code coverage of given application program.
- ✓ Build a kernel with given target board specifications.
- ✓ Build a library of for arithmetic operations.
- ✓ Demonstrate interprocess communication with IPC mechanisms.

UNIT - I

INTRODUCTION: U/Linux History, GNU/Linux Architecture, Free Software Development; GNU Tools-I-The GNU Compiler Tool chain

UNIT - II

GNU TOOLS-II: Building Software with GNU *make,* Building and Using Libraries, Coverage Testing with GNU *gcov,* Profiling with GNU *gprof.*

UNIT - III

LINUX KERNEL: Introduction to the Linux Kernel, Getting Started with the Kernel, Process Management, Process Scheduling.

UNIT - IV

APPLICATION DEVELOPMENT: File Handling in GNU/Linux, Programming with Pipes, Introduction to Sockets Programming, GNU/Linux Process Model, POSIX Threads (Pthreads) Programming, IPC with Message Queues, Synchronization with Semaphores, Shared Memory Programming, Other Application Development Topics

UNIT - V

GNU/LINUX SHELLS AND SCRIPTING: GNU/Linux Commands, Bourne-Again Shell (bash); Debugging and Testing- Software Unit Testing Frameworks, Debugging with GDB.

TEXT BOOKS :

1. M. TIM Jones "GNU/LINUX Application Programming", 2nd edition, Charles River Media (Cengage Learning), 2008.
2. Robert Love and Addison-Wesely, "Linux Kernel Development", 3rd Edition, Addison-Wesly, 2010.

REFERENCE BOOKS :

1. W. Richard Stevens, "Unix Network Programming", 2nd edition, Pearson Eduction, 1999.
2. Alessandro Rubini and Jonathan Corbet, "Linux Device Drivers", 2nd edition, O Reilly and Associates, Inc, 2001.

16EC271 - EMBEDDED SYSTEMS AND RTOS

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

The learner will obtain a good exposure of Embedded Systems and Real Time Operating Systems(RTOS) and will get a knowledge of how to design an embedded system with RTOS.

Course Outcomes:

The student will be able to :

- ✓ Understand the fundamentals of embedded systems from both hardware and software perspective.
- ✓ Understand the design process of embedded system via descriptive and formalized procedures.
- ✓ Explain various embedded system applications and design requirements.
- ✓ Generate product specification for embedded system.
- ✓ Understand the basic concepts of RTOS.
- ✓ Understand the necessity of networked embedded systems for real time applications.
- ✓ Understand how to Design embedded system through examples.

SKILLS ACQUIRED:

- ✓ Able to analyze design requirements.
- ✓ Able to design new hardware and software for different applications.
- ✓ Able to choose RTOS platform for the application
- ✓ Able to design Scheduling algorithms for Embedded systems with RTOS
- ✓ Able to choose necessary networking for the embedded system

ACTIVITIES:

- ✓ Design an architecture for networked household security system
- ✓ Design testing procedure for networked household security system
- ✓ Identify the hardware components necessary for a live traffic control system
- ✓ Design a I^2C bus basedembedded system for patient monitoring system
- ✓ Design CAN bus based networked real-time embedded system for automation in automobile industry

UNIT - I

INTRODUCTION TO EMBEDDED SYSTEMS: Basic concepts; Categories, Specialities, Recent trends in embedded systems; Architecture of Embedded Systems: Hardware architecture, Software architecture, Application software, Communication software, Process of generating executable image, Development /testing tools.

UNIT - II

PROCESS OF EMBEDDED SYSTEM DEVELOPMENT: Requirements, Specification, Architecture design, Designing hardware and software components, System Integration, Formalisms for system design, Structural description, Behavioural description, Program Design and Analysis: Components for Embedded programs, Models of Programs, Assembly, Linking and Loading, Compilation techniques.

UNIT - III

PROCESSES AND OPERATING SYSTEMS: Multiple tasks and multiple processes, Multirate systems, RTOS basics: Architecture of Kernel, Tasks and Task Scheduler - Task States, Content Switching, Scheduling Algorithms, Rate Monotonic Analysis, Task, Management Function Calls. Interrupt Service Routines, Semaphores, mutex, mailboxes, message queues, event registers, pipes, signals, timers, memory management, Priority Inversion Problem.

UNIT - IV

REAL TIME OPERATING SYSTEMS: POSIX, Windows CE, Networks and Multiprocessors: Categories of Multiprocessors, Distributed embedded systems-Network abstractions, CAN bus, Distributed computing in cars and airplanes, I^2C bus, Ethernet, Internet, MPSoCs and shared memory multiprocessors.

UNIT - V

DESIGN EXAMPLES: Model train controller, Audio Player, Digital still camera, Engine Control unit, Video accelerator.

TEXT BOOKS:

16EC370 MICROCONTROLLERS FOR EMBEDDED SYSTEMS

Hours Per Week:

L	T	P	C
3	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objectives :

The learner will obtain a good exposure of Embedded Systems covering the hardwarecomponents and software aspects and will get a good knowledge of ARM processors and LPC2148 chip and their programming and interfacing.

Course Outcomes :

The student will be able to :

- ✓ Understand the fundamentals of embedded systems from both hardware and software perspective
- ✓ Understand the design process of embedded system
- ✓ Explain various embedded system applications and design requirements
- ✓ Identify the microcontroller for the embedded system
- ✓ Explain architecture of LPC 2148 controller,ARM CORTEX-M3, their subsystems, bus arrangement andmemory and I/O maps.
- ✓ Develop Assembly level and C language levelprograms for specified aims.
- ✓ Discuss specifications of peripheral interfaces in LPC 2148 like I/O ports, PWM generation block.

SKILLS ACQUIRED:

- ✓ Able to analyze design requirements.
- ✓ Able to design new hardware and software for different applications.
- ✓ Able to design systems using LPC 2148 and ARM Cortex-M3.
- ✓ Able to develop programs using Embedded-C for LPC 2148.

ACTIVITIES:

1. Interface a ADC-LPC 2148.
2. Interface LEDs to ARM7 controller.
3. Interface a stepper motor to ARM 7 controller.
4. Interface as even segment display

UNIT - I

INTRODUCTION TO EMBEDDED SYSTEMS: Basic concepts; Categories, Specialities, Recent trends in embedded systems; Architecture of Embedded Systems: Hardware architecture, Software architecture, Application software, Communication software, Process of generating executable image, Development /testing tools, Process of Embedded System Development: The development process, Requirements engineering, Design

UNIT - II

TYPES, SELECTION AND APPLICATIONS OF MICROCONTROLLERS: Microcontrollers, Types of Microcontrollers, Examples of Popular Microcontrollers, Selection of Microcontroller, Applications, Overview of 8051 microcontroller, ARM processor fundamentals.

UNIT - III

LPC 2148 CONTROLLER ARCHITECTURE: General Description – Features – Block diagram –Overall pin description (functional) - Architectural Overview On-chip Flash program memory –Onchip SRAM –Memory Map - Interrupt Controller – General Purpose I/O (GPIO) – ADC and DAC –UARTs - USB Controller - Timers and Counters – Watchdog Timer – Real-time CLK.

UNIT - IV

ARM CORTEX-M3: ARM Cortex-M3 Processor –Architecture- Instruction Set Development, TheThumb-2 Technology.

UNIT - V

OVERVIEW OF C: Programming in C, Arrays, Structures, Pointers, Loops and Decisions, Functions, EMBEDDED C: Header files for Project and Port, Example: Restructuring the Hello, Embedded World example. LPC 2148 PROGRAMMING: Programming of LPC 2148 GPIO ports - Generation of PWM signals -Simple programs.

17ES004 DESIGN OF IOT SYSTEM (IOT)

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
60	-	-

WA/RA	SSH/HSH	CS	SA	S	BS

Course Description and Objectives:

Students will be able to design & develop IOT Devices.

Course Outcomes:

Upon successful completion of this course student should be able to:

- ✓ Able to programs for IoT applications
- ✓ Able to design the framework necessary for IoT applications
- ✓ Able to develop prototypes for IoT devices and app

SKILLS ACQUIRED:

- ✓ Able to understand IoT Concepts
- ✓ Able to design the different IoT system applications.

ACTIVITIES:

- ✓ design various simple IoT Applications

UNIT – I

Developing Internet of Things & Logical Design using Python: Introduction, IOT Design Methodology, Installing Python, Python Data Types & Data Structures, Control Flow, Functions, Modules, Packages, File Handling, Date/ Time Operations, Classes, Python Packages,
IoT Physical Servers and Cloud Offerings: introduction to cloud sotrage models and communication APIs, Python Web Application Framework - Django, SkyNet IoT Messaging Platform.

UNIT – II

D**esign Principles for Connected Devices:** Design Principles for Connected Devices, Calm and Ambient Technology, Magic as Metaphor, Privacy, Web Thinking for Connected Devices, Affordances

UNIT – III

Thinking about Prototyping: Sketching, Familiarity, Costs versus Ease of Prototyping, Prototypes and Production, Open Source versus Closed Source, Tapping into the Community
Prototyping Embedded Devices: Electronics, Embedded Computing Basics, Arduino, Raspberry Pi, Beagle Bone Black, Electric Imp, Other Notable Platforms

UNIT – IV

Prototyping Online Components: Getting Started with an API, Writing a New API, Real-Time Reactions, Other Protocols
Techniques for Writing Embedded Code: Memory Management, Performance and Battery Life, Libraries, Debugging

UNIT – V

Case Studies Illustratign IoT Design: Introduction, Home automation-smart lighting-home intrusion detection, Cities-smart parking, Environment-Air pollution monitoring, Agriculture-smart irrigation, productivity appliances-IoT printer,Data Analytics for IoT: Introduction.

TEXTBOOKS:

1. Vijay Madisetti, Arshdeep Bahga,” Internet of Things A Hands-On- Approach”,2014,
2. Adrian McEwen, “Designing the Internet of Things”, Wiley Publishers, 2013,
3. Microsensors, MEMS, and Smart Devices, Julian W. Gardner, Vijay K. Varadan Osama O. Awadelkarim, 2001, John Wiley & Sons Ltd.

REFERENCE BOOKS:

1. Francis daCosta, “Rethinking the Internet of Things: A Scalable Approach to Connecting Everything”, 1 st Edition, Apress Publications, 2013
2. Cuno Pfister, Getting Started with the Internet of Things, O‟Reilly Media, 2011, ISBN: 978-1-4493- 9357-1

INTERNET OF THINGS (LAB)

Course Learning Outcomes:

- ✓ To be able to understand importance of Python Programming and its usage.
- ✓ To be able to understand and work with Raspberry Pi and Arduino

LIST OF EXPERIMENTS

1. Familiarization with Python programming, use of various functions
2. Create python code to understand the tendency of users on social media platform
3. Storing the local data to cloud using Python
4. Sending Messages over internet using python
5. Familiarization with raspberry pi board
6. Python Programming for the Raspberry Pi and interfacing with web
7. Familiarization with Arduino board
8. Python Programming for Arduino and interfacing with web
9. Controlling lights remotely using Raspberry Pi
10. Detecting the movement of objects and sending caution signals remotely using Raspberry Pi

ELECTRICAL & ELECTRONICS ENGINEERING

16EE253 SOLAR PV TECHNOLOGY-I

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course is aimed at familiarizing the students with the characteristics of solar radiation, its global distribution, and measurement of solar radiation. In this subject students will learn the fundamentals, characteristics, parameters and manufacturing of solar PV cells.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the characteristics and world distribution of solar radiation.
- ✓ Analyze the solar radiation and measurement techniques.
- ✓ Calculate the methods of calculation of solar radiation availability at a given location.
- ✓ Understand the effect of irradiation and temperature on solar cells.
- ✓ Understand the manufacturing processes of the solar cells.

SKILLS ACQUIRED:

- ✓ Able to understand the spectral energy distribution of solar radiation.
- ✓ Able to understand the principle of solar power generation.
- ✓ Able to understand different sun-earth angles.
- ✓ Able to draw the I-V characteristics of a PV cell
- ✓ Able to understand the Production process of solar cells.

ACTIVITIES:

1. Measurement of Beam radiation.
2. Measurement of Diffused radiation.
3. Obtain the Variation of declination angle for each day of a year.
4. Measurement of current – voltage characteristics of a solar panel.
5. Draw the process flow diagrams of manufacturing techniques of solar cells.
6. Design a solar cap.
7. Design a solar fan.

UNIT - I

SOLAR RADIATION AND MEASUREMENT: World energy resources - Indian energy scenario, Global solar resources. Solar radiation on the earth surface – Extraterrestrial and Terrestrial radiation, spectral energy distribution of solar radiation, solar radiation measuring instruments, Local apparent time.

UNIT - II

SOLAR RADIATION GEOMETRY AND CALCULATIONS: Solar radiation geometry - latitude and longitude sun-earth angles, calculation of angle of incidence, solar radiation on horizontal and tilted surface, Solar day length, Angstroms equation and constants.

UNIT - III

SOLAR CELL FUNDAMENTALS: Photovoltaic effect - Principle of direct solar energy conversion into electricity in a solar cell, Semiconductor properties, p-n junction, energy levels, basic equations, Solar cell structure.

UNIT - IV

PARAMETERS OF SOLAR CELL: Open circuit voltage, Short circuit current, series and shunt resistances, Single diode model of solar cell, I-V characteristics of a PV cell, cell efficiency, fill factor, effect of irradiation and temperature.

UNIT - V

MANUFACTURING OF PV CELLS: Commercial solar cells - Production process of single crystalline silicon cells, multi crystalline silicon cells, amorphous silicon, cadmium telluride, copper indium gallium diselenide cells, introduction to multi junction solar cell.

16EE357 SOLAR PV TECHNOLOGY-II

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course is aimed at familiarizing the students with the design aspects of solar cell, series and parallel connection of solar cells, I-V characteristics of a PV module. In this subject students will learn the sun tracking mechanisms, emerging solar cell technologies and PV system applications.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the design of solar cells.
- ✓ Analyze the effect of irradiation and temperature on solar panels.
- ✓ Understand the prospects of photovoltaic technology for sustainable power generation.
- ✓ Understand the various applications of solar modules.

SKILLS ACQUIRED:

- ✓ Able to understanding the design aspects of solar cells.
- ✓ Able to analyze the I-V characteristics of a PV module.
- ✓ Able to acquire a skill of understanding different emerging technologies of solar cells.
- ✓ Able to get a skill of understanding the various applications of PV systems.

ACTIVITIES:

1. Series and Parallel Connection of PV modules.
2. Obtain the I-V characteristics of two solar panels connected in series.
3. Obtain the I-V characteristics of two solar panels connected in parallel.
4. Design a solar charger.
5. Design a solar lamp.
6. Design of Solar Tracker.
7. Design of a solar water pump.

UNIT - I

DESIGN ASPECTS OF SOLAR CELLS: Design of solar cells, Design for high I_{sc}, Design for high V_{oc}, Design for high Fill factor, solar simulator: I-V measurement, Quantum efficiency measurement.

UNIT - II

SOLAR PV MODULE: Series and parallel connection of solar cells, solar pv module, solar pv array, parts of solar pv modules, manufacturing process, Ratings and I-V characteristics of a PV module, efficiency, fill factor, effect of irradiation and temperature, Hot spots.

UNIT - III

MAXIMUM POWER POINT TRACKING: Sun tracking – single and dual axis tracking, P-V curves, maximum voltage and current in pv cell, concept of MPPT technique and introduction to algorithms.

UNIT - IV

BATTERY ENERGY STORAGE: Fundamental concept of batteries - Measuring of battery performance, Charging and discharging of a battery, Storage density, Energy density and safety issues; Types of batteries – Lead Acid, Nickel, Cadmium, Zinc Manganese dioxide; Introduction to modern batteries - Zinc-Air, Nickel hydride and lithium batteries.

UNIT - V

PV SYSTEM APPLICATIONS: Building-integrated photovoltaic units, grid-interacting central power stations, standalone devices for remote and rural areas, solar lamps, solar street lights, solar water pumps solar cars, aircraft, space solar power satellites.

EMERGING SOLAR CELL TECHNOLOGIES: Thin film solar cell technologies, Organic solar cells, Dye-synthesized solar cells, GaAs solar cells, Thermo Photovoltaics, Concentrated Photovoltaics

TEXT BOOKS:

16EE358 DESIGN AND ECONOMICS OF SOLAR PV SYSTEMS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course is aimed at familiarizing the students with the classification of PV systems, components of PV systems and design of photovoltaic systems. In this subject students will earn the knowledge of financial and economic analysis.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the components of solar PV systems.
- ✓ Understand the design concepts of solar PV systems.
- ✓ Understand the socio-economic and environmental merits of photovoltaic systems for a variety of applications.
- ✓ Analyze the economic analysis of solar PV system.

SKILLS ACQUIRED:

- ✓ Classify the different solar PV systems.
- ✓ Understand the different components of solar PV systems.
- ✓ Understand the concept to design PV systems for various applications.
- ✓ Analyze the concepts and methods of energy economics to solar energy systems.
- ✓ Understand the Life cycle costing of solar systems.

ACTIVITIES:

1. Design a PV system for an Apartment.
2. Design a solar water pumping systems for an agricultural application.
3. Efficiency measurement of Standalone Solar PV System.
4. Life cycle Analysis of a solar PV plant.

UNIT - I **L-10, T-3**

CLASSIFICATION OF PV SYSTEMS: Classification - Central Power Station System, Distributed PV System, Stand alone PV system, Grid Interactive PV System, small system for consumer applications, Hybrid solar PV system.

UNIT - II **L-08, T-3**

COMPONENTS OF PV SYSTEMS: System components - PV arrays, inverters, batteries, charge controls, net power meters. PV array installation, operation, costs, reliability.

UNIT - III **L-08, T-3**

DESIGN OF PV SYSTEMS: Design of solar PV systems. Case study of design of solar PV lantern, stand alone PV system - Home lighting and other appliances, solar water pumping systems.

UNIT - IV **L-09, T-3**

FINANCIAL AND ECONOMIC PERFORMANCE: Introduction to financial and economic performance - Merits and limitations for solar energy projects - time value of money, benefits/cost ratios, discount rate, standard and discount payback period, depreciation and net present benefit.

UNIT - V **L-10, T-3**

ECONOMIC ANALYSIS: Energy economics-basic concepts, unit cost of power generation from different sources, payback period, NPV, IRR and benefit cost analysis. Direct and indirect costs, pricing system and Life cycle costing.

16EE459 SOLAR THERMAL CONVERSION SYSTEMS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course is aimed at familiarizing the students with principles of operation, structure, testing and installation of major types of solar thermal collectors. In this subject students will earn the knowledge solar thermal energy storage.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the basics of heat energy and heat transfer.
- ✓ Understand the concepts of solar collectors.
- ✓ Understand the solar thermal energy storage and variety of applications.
- ✓ Understand the various applications of solar collectors.

SKILLS ACQUIRED:

- ✓ Understand the fundamentals of solar flat plate collectors.
- ✓ Understand the fundamentals of concentrating solar collectors.
- ✓ Familiar with the solar low, medium and high temperature applications.

ACTIVITIES:

1. Design a prototype of solar cooker.
2. Design a prototype of solar still.
3. Design a prototype of solar dryer.
4. Evaluate the performance of solar water heating system at guest house, VFSTR University.

UNIT - I

BASICS OF HEAT ENERGY AND HEAT TRANSFER: Heat, Fundamentals of Heat transfer, Modes of heat transfer – Conduction, Convection and radiation, Basic laws of heat transfer - General discussion about applications of heat transfer, Laws of thermo dynamics.

UNIT - II

SOLAR FLAT PLATE COLLECTORS: Fundamentals of solar collectors as devices to convert solar energy to heat. Non - concentrating low temperature flat plate and concentrating collectors, classification of concentrating collectors, evacuated tube collectors, solar air heaters.

UNIT - III

SOLAR CONCENTRATING COLLECTORS: Line-focusing and point-focusing concentrators: parabolic trough, parabolic dish, heliostat field with central receiver, Fresnel lenses, compound parabolic concentrator. Sun tracking mechanisms.

UNIT – IV

SOLAR ENERGY STORAGE: Different methods, Sensible, latent heat and thermo chemical storage, solar ponds.

UNIT – V

APPLICATIONS OF SOLAR COLLECTORS: Application of non-concentrating collectors for solar water heating with natural and pump circulation, space heating, drying, seawater desalination, solar cooker. Use of concentrating collectors for process heat production and power generation.

FOOD TECHNOLOGY

16CH246 FOOD SAFETY AND REGULATIONS

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

This course will deal with various laws and regulations to be followed by food industries. The objective of this course is to enable the students to have a clear idea about various laws governing the food product and process specification

Course Outcomes:

The student will be able to

- ✓ Understand the requirement of food laws
- ✓ Understand the role of each food law
- ✓ Gain knowledge about how to attain certification for standards

SKILLS ACQUIRED:

- ✓ Identify the source of contamination
- ✓ Determine the standards to be followed to attain certification

ACTIVITIES:

- ✓ List down microbial standards from FSSAI

UNIT – I

Introduction, concept of food safety and standards (FSSAI), food safety strategies.Food hazards and contaminations - biological, chemical and physical factors.Prevention and control of hazards.

UNIT – II

Indian Food Regulatory Regime (Existing and old), PFA Act and order, Additives, Contaminants and Pesticide Residue. Essential Commodities Act, 1955,

UNIT – III

International Food Standards., Export (Quality Control and Inspection) Act, 1963. BIS Other product specific standards; AGMARK.

UNIT – IV

Voluntary Quality Standards and Certification GMP, GHP, HACCP, GAP, Good Animal Husbandry Practices, Good Aquaculture Practices,

UNIT – V

Traceability and authentication, Certification and quality assurance;Risk assessment studies: Risk management, risk characterization and communication.;ISO 9000, ISO 22000, ISO 14000, ISO 17025, PAS 22000, IFS.Halal & Kosher Standard.

Text Books:

1. Singal RS, Handbook of indices of food quality and authenticity; Woodhead Publ. Cambridge, UK.
2. Shapton DA, Principles and practices of safe processing of foods; Butterworth Publication, London.
3. Winton AL, Techniques of food analysis; Allied Science Publications New Delhi.

Suggested Readings:

1. Pomeranze Y, Food analysis - Theory and Practice; CBS Publications, New Delhi.

16CH346 FOOD QUALITY AND EVALUATION

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

This course will deal with various methods on how to maintain quality of food Which is useful in export markets and storage of foods.’

The objective of this course is to enable student to have clear idea on how to maintain quality of food.

Course Outcomes:

The Student will be able to understand

- ✓ General principles of food quality.
- ✓ Quality attributes of food.
- ✓ Quality control Aspects in Food industries.

SKILLS ACQUIRED:

- ✓ Identify the quality of food.
- ✓ Determine the international standards for exports

ACTIVITIES:

- ✓ Carryout sensory analysis on different food products using differential methods.

UNIT – I

Definitions - food quality General principles of food quality. Hazards - physical, chemical and biological.

UNIT – II

Cross contamination Limits for pesticide and metal contamination of food. Food additives- types- usage, permissible limits

UNIT – III

Quality attributes - size, shape, colour, viscosity, texture, taste and flavor.

UNIT – IV

Quality control system in storage, Quality control aspects in food industries, Importance of quality control in marketing of Food products - domestic and export markets.

UNIT – V

International standards for export and quarantine requirements for export of Agricultural and Horticultural produce.

Text Books:

1. Shapton DA, Principles and practices of safe processing of foods; Butterworth Publication, London.
2. Winton AL, Techniques of food analysis; Allied Science Publications New Delhi.

Suggested Readings:

1. Pomeranze Y, Food analysis - Theory and Practice; CBS Publications, New Delhi.
2. Jacob MB, The chemical analysis of foods and food products; CBS Publ. New Delhi

16CH346 SUBJECTIVE AND OBJECTIVE EVALUATION IN FOOD PRODUCTS

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

This course will deal with quality evaluation, objectively and subjectively the objective of this course is to avail the student with various experimental methods

Course Outcomes:

- ✓ The student will be able to evaluate subjective and objective evaluation comparison.
- ✓ Instrumental analysis will be performed by the students

SKILLS ACQUIRED:

- ✓ Evaluate the quality and compare objectively and subjectively
- ✓ Instrumental analysis like spectroscopy, polarimetry, DSC, SEM,TEM,GC and HPLC

ACTIVITIES:

- ✓ List down USFDA standards for jam and jelly.
  .

UNIT – I

Introduction and importance of quality evaluation- subjective and objective evaluation comparison

UNIT – II

Subjective evaluation Introduction and importance- sensory analysis

UNIT – III

Sensory evaluation – methods and application.

UNIT – IV

Objective/ instrumental analysis – spectroscopy; Polarimetry; DSC; SEM; TEM; GC; HPLC

UNIT – V

Objective analysis of Rheological and textural properties

Text Books:

1. Singal RS, Handbook of indices of food quality and authenticity; Woodhead Publ. Cambridge, UK.
2. Shapton DA, Principles and practices of safe processing of foods; Butterworth Publication, London.

Suggested Readings:

1. Pomeranze Y, Food analysis - Theory and Practice; CBS Publications, New Delhi.

16CH446 FOOD SAFETY AND PUBLIC HEALTH

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

The course will deal with how to maintain food safety, quality, and quantity management of food. The objective of this course is to learn about various food borne infections.

Course Outcomes:

- ✓ The student will get knowledge about GHP, GAP and GMP.
- ✓ The student will also know about safety standards

SKILLS ACQUIRED:

- ✓ Principles of food safety
- ✓ Quality Management
- ✓ Microbiological standards and guidelines

ACTIVITIES:

- ✓ List down GMP and GHP standards for processing of tea..

UNIT – I

Introduction and Principles of food safety–Food Safety System - Quality attributes- Total Quality Management.

UNIT – II

Background and Structure, GHP, GAP, GMP, Principles and Implementation of HACCP- case studies.

UNIT – III

Food borne infections and intoxications; characteristic of microorganism; microbial growth in food; intrinsic and extrinsic factors

UNIT – IV

Food poisoning - botulism –, Food sanitation – indicators of food safety – coliform bacteria food processing plant sanitation – microbiological standards and guidelines -salmonellosis – gastroenteritis, .,

UNIT – V

Food borne pathogens – *Clostridium, Bacillus ceres, Staphylococcus aureus, Vibrio, Campylobacter, Yersinia etc*- coliform bacteria food processing plant sanitation – microbiological standards and guidelines

Text Books:

1. Winton AL, Techniques of food analysis; Allied Science Publications New Delhi.

SUGGESTED READINGS:

1. Pomeranze Y, Food analysis - Theory and Practice; CBS Publications, New Delhi.

INFORMATION TECHNOLOGY

16CS246 UNIX/LINUX AND SHELL PROGRAMMING

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

Student explore to Unix/Linux operating system utilities like file processing, process management, disk management, networking and ability to write the shell program for specific task.

Course Outcomes:

- ✓ Installing several Linux distributions on direct hardware setup and virtual hardware setup
- ✓ Managing files and directives
- ✓ Knowing process attributes and basic level of process management
- ✓ Able to write shell script for given operating system task

SKILLS ACQUIRED:

- ✓ File and process manipulation
- ✓ Design and develop shell script programs

ACTIVITIES:

- ✓ Understand the Linux environment
- ✓ Perform file management and multiple tasks using shell scripts in Linux environment.
- ✓ Administer user accounts and provide file security.
- ✓ Create user - defined commands through system calls.

.

UNIT – I

Introducing the Unix and Linux Operating System: A Brief History of Unix, Linux and Unix, Installing Linux, Introducing Unix/Linux shells, Logging into Unix/Linux, Basic commands: date, cal, who, clear, man, whatis.

UNIT – II

Understanding Unix/Linux File System: Exploring the Root Hierarchy, Using paths, Pathnames, and Prompts, pwd, Navigating the file system, cd, ls, mkdir, cp, rm, chmod, Usage of Vi editor.

UNIT – III

Unix/Linux file Processing: Input/output redirection, manipulating files- cat, touch, mv, find, paste, cut, sort, join, Advanced file processing: Selection commands-pipe, comm., diff, head, tail, wc, uniq, grep, sed.

UNIT – IV

Introduction to shell script programming: The program development lifecycle, variables, shell operators, redirection operators, more about wild card characters, shell logic structure, sequential logic, decision logic.

UNIT – V

Shell Script looping logic, the while loop, case logic, using shell functions, exploring the unix/Linux utilities- df, du, finger, ps, uname, ifconfig, ping, netstar, Installing application and packages in Linux.

Text Book:

16CS352 JAVA PROGRAMMING

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

This course intended to develop software that covers the principles of object oriented programming which includes defining class, creating objects, usage of abstraction, encapsulation, inheritance and polymorphism. Further, it offers concepts of multi-threading and exception handling

Course Outcomes:

The student will be able to:

- ✓ Distinguish between procedures oriented and object oriented concepts of programming.
- ✓ Understand OOP concepts and features of Java language.
- ✓ Apply Object Oriented concepts in problem solving.

SKILLS ACQUIRED:

- ✓ Data hiding and abstraction
- ✓ Code reusability
- ✓ Create new packages and interfaces
- ✓ Develop multi-threaded applications
- ✓ Runtime error handling Parallel programming

ACTIVITIES:

- ✓ Implementing the concept of encapsulation.
- ✓ Design a sample program which exhibits inheritance
- ✓ Developing a program which implements polymorphism
- ✓ Implementing a program for multithreading
.

UNIT – I

INTRODUCTION: Creation of Java, Importance of Java to Internet, Byte code, Java buzzwords, OOP principles, Encapsulation, Inheritance and polymorphism, Compiling and running of simple Java program, Data types, Variables, Declaring variables, Dynamic initialization, Scope and life time of variables, Arrays, Operators, Control statements, Type conversion and casting.

UNIT – II

CLASSES AND OBJECTS: Concepts of classes and objects, Class fundamentals, Declaring objects, Assigning object reference variables, Introducing methods, Constructors, Usage of static with data and methods, Usage of final with data, Access control, This key word, Garbage collection, Overloading methods and constructors, Call by value, Recursion, Nested classes and inner classes.

UNIT – III

INHERITANCE: Basic concepts, Member access rules, Usage of super key word, Forms of inheritance, Method overriding, Abstract classes, Dynamic method dispatch, Using final with inheritance.

UNIT – IV

PACKAGES AND INTERFACES: The object class, Defining, Creating and accessing a package, Understanding classpath, Importing packages, Differences between classes and interfaces, Defining an interface, Implementing interface, Applying interfaces, Variables in interface and extending interfaces.

UNIT – V

EXCEPTION HANDLING, MULTI THREADING: Concepts of exception handling, Types of exceptions, Usage of try, Catch, Throw, Throws and finally keywords, Built-in exceptions, Creating own exception, Sub classes, Concepts of multithreading, Differences between process and thread, Thread life cycle, Creating multiple threads using thread class, Runnable interface, Synchronization, Thread priorities, Inter thread communication.

16IT343 MOBILE APPLICATION DEVELOPMENT USING ANDROID

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

Students will be able to:

- ✓ Get familiarity with the Android operating system development environment.
- ✓ Create user-friendly mobile user interfaces and views. Develop basic Android applications for mobiles

SKILLS ACQUIRED:

- ✓ Writing mobile applications for user requirements.
- ✓ Usage of various components of Android operating system.
- ✓ Utilization of activities, intents, layouts and views for content.

ACTIVITIES:

- ✓ Installation of Android Studio and required plug-ins.
- ✓ Creating activities, Dialog boxes and linking other activities in the application.
- ✓ Creating applications by using Activities, Fragments and Intents.
- ✓ Implementing applications using different views.

UNIT – I

GETTING STARTED WITH ANDROID**:** Android introduction, Versions of android, Features of android, Architecture, Devices in the market, Developer community.

UNIT – II

ACTIVITIES, FRAGMENTS, INTENTS: Understanding activities, Linking activities using intents, Fragments, Calling built in apps using intents.

UNIT – III

GETTING TO KNOW ANDROID UI: Understanding the components of screen - Views and view groups, Liner layout, Absolute layout, Table layout, Relative layout, Frame layout, Scroll view.

UNIT – IV

DISPLAY ORIENTATION: Anchoring views, Resizing and repositioning views, Managing changes to screen orientation, Utilizing the action bar, Creating UI programmatically.

UNIT – V

DESIGNING UI WITH VIEWS: Using basic views - Text view, Button, Image Button, Edit text, check Box, Toggle button, Radio button, and Radio group views, Progress bar view and Auto complete text view.

Test Book:

3. Adam Gerber and Clifton Craig, "Learn Android Studio", 1st Edition, Apress, 2015.

16IT443 ADVANCED MOBILE APPLICATION DEVELOPMENT USING ANDROID

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

This course enables the student to explore advanced user interface components, persistent data storage, messaging techniques, client/server applications and mobile app development process. In addition, the student develops his/her ability to create two/three or n-tier mobile applications.

Course Outcomes:

The student will be able to:

- ✓ Get familiarity in mobile user interface components.
- ✓ Use data storage procedures and retrieval process.
- ✓ Apply several mobile communication techniques.
- ✓ Create interoperable mobile apps using version control and deployment.

SKILLS ACQUIRED:

- ✓ Design and development of mobile commerce applications.
- ✓ Implement temporary and persistent mobile apps like contacts, messaging, and messengers etc…
- ✓ Prepare apk or other mobile app deployment format files.

ACTIVITIES:

- ✓ Create Image Gallery for online Shopping in Grid view.
- ✓ Create menus for any one standard mobile application.
- ✓ Design and develop contacts mobile application using SQLite Database.
- ✓ Implement an Android program for HTTP Connection
- ✓ Design and develop simple charting mobile app using socket programming
- ✓ Create the APK file for all the above mobile experiments and create signature certificates.

.

UNIT – I

DISPLAYING PICTURES AND MENUS WITH VIEWS: Image views to display pictures - Gallery and Image views, Image Switcher, Grid View; Menu Views – Creating the helper methods, Option menu, Content Menu.

UNIT – II

DATA PERSISTENCE: Creating and using data bases – Creating and DBAdapter helper class, Using Data base, Creating Database.

UNIT – III

MESSAGING: SMS Messaging – Sending SMS Messages, Sending SMS using Intent, Receiving SMS messages, Sending E-mail.

UNIT – IV

NETWORKING: Consuming web services using HTTP, Consuming JSON Services, and Socket Programming.

UNIT – V

PUBLISHING ANDROID APPLICATION: Preparing for publishing – Versioning your application, Digitally signing android applications; Deploying APK File using Deployment tools.

Test Book:

1. Wei-Meng Lee, "Beginning Android Application Development", 1st Edition, John Wiley & Sons, Inc, 2012.

16CS448 PYTHON PROGRAMMING

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

This course is aimed at offering the fundamental concepts of Python scripting language to the students. It starts with the basics of python programming and deal with lists, dictionaries, functions, exceptions and files. The objective of this course is to enable the students to develop the applications using the concepts of python.

Course Outcomes:

Student will be able to

- ✓ Understand the basic terminology used in computer programming to write, compile and debug programs in python language
- ✓ Use different data types to design programs involving decisions, loops, and functions.
- ✓ Handle the exceptions which are raised during the execution of python scripts.

SKILLS ACQUIRED:

- ✓ Identify suitable data types of an application
- ✓ Apply control statements for decision making problems.
- ✓ Design an application to perform various operations using class
- ✓ Create a list of data and perform operations on data and result is stored on file

ACTIVITIES:

- ✓ Implement of data types such as scalars, arrays, lists using Python.
- ✓ Develop functions using Python.
- ✓ Copy the content of one file into another.
- ✓ Perform operations such as display, calculate percentage, add, delete and modify student data.
- ✓ Implement matrix operations.

UNIT - I

Introduction: History of Python Features of Python, Python Installation on Windows & LINUX, Running Python Scripts, Variables, Assignment, Keywords, Input-Output, Indentation.

UNIT - II

Types, Operators and Expressions: Types - Integers, Strings, Booleans; Operators- Arithmetic Operators, Comparison (Relational) Operators, Assignment Operators, Logical Operators, Bitwise Operators, Membership Operators, Identity Operators, Expressions and order of evaluations.

Control Flow: if, elif, else, for, while, break, continue, pass

UNIT - III

Data Structures Lists - Operations, Slicing, Methods; Tuples, Sets, Dictionaries, Sequences. Comprehensions.

UNIT - IV

Functions - Defining Functions, Calling Functions, Passing Arguments, Keyword Arguments, Default Arguments, Variable-length arguments, Anonymous Functions, Fruitful Functions (Function Returning Values), Scope of the Variables in a Function - Global and Local Variables. **Modules:** Creating modules, import statement, from. Import statement, name spacing,

Error and Exceptions Difference between an error and Exception, Handling Exception, try except block, Raising Exceptions.

UNIT - V

Files: Opening and Closing files, reading and writing, tell (), seek(), rename ()

Object Oriented Programming OOP in Python: Classes, Methods, Constructor Method, Inheritance, Overriding Methods.

Text Books

1. Python Programming: A Modern Approach, Vamsi Kurama, Pearson
2. Learning Python, Mark Lutz, Orielly (files)

Reference Books

1. Think Python, Allen Downey, Green Tea Press
2. Core Python Programming, W.Chun, Pearson.
3. Introduction to Python, Kenneth A. Lambert, Cengage

16CS353 STATISTICS USING PYTHON

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

This course makes a student familiar with the python interactive environment which includes the installation of statistical packages, data structures, statistical functions, different data format conversions and various plots. In addition, it teaches to perform statistical manipulations and programming in a more efficient way when compared with traditional statistical analysis.

The students will be able to:

- ✓ Hands on practice in exploratory data analysis.
- ✓ Use of several distributions.
- ✓ Write functions including generic functions using various methods and loops.
- ✓ Select and perform manipulations on values as required for a specific statistical analysis.

SKILLS ACQUIRED:

- ✓ Create a large corpus using lists and data frames.
- ✓ Perform Linear algebra operations on data for finding correlation and covariance.
- ✓ Develop functions for data manipulation algorithms.

ACTIVITIES:

- ✓ Taking the large amounts of data and finding vector length, min, mode, max and average of that data.
- ✓ Applying list operations on big data for data interpretation.
- ✓ Converting list data into data frames and performing various operations on the data frames.
- ✓ Reading the data from various formats and converting them into required formats.

UNIT – I

Exploratory Data Analysis: A statistical approach, Importing the Data, Data Frames, Variables, Transformation, Validation, Interpretation.

Unit – II

Distributions: Representing Histograms, Plotting Histograms, NSFG variables, Outliers, First Babies, Summarizing Distributions, Variance, Effect Size, Reporting Results.

Unit – III

Probability Mass Functions: PMFS, Plotting PMFs, Other visualizations, The class size paradox, DataFrame Indexing

Unit – IV

Cumulative Distribution Functions: The limits of PMFs, Percentiles, CDFs, Representing CDFs, Comparing CDFs, Percentile-based statistics, Random Numbers, Comparing Percentile Ranks.

Unit – V

Modeling Distributions: The exponential distribution, The normal distribution, Normal Probability plot, The log normal distribution, The pareto distribution, Generating random numbers.

Text Book:

1. Allen B. Downey, " Think Stats: Explorating Data Analysis", 2nd Edition, O'Reilly Media, 2014.

Reference Book:

16CS446 DATA SCIENCE USING PYTHON

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objective:

Through this Data Science with Python course, students will learn how to process, clean, visualize and analyze data by using Python, one of the most popular data science tools. Students will learn cutting edge Machine Learning techniques in Python. Post the course learners will become an in-demand Data Scientists.

Course Outcomes:

Students are able to:

- ✓ Learn how to analyze large amounts of data to bring out insights
- ✓ Get knowledge on relevant examples and cases make the learning more effective and easier
- ✓ Gain hands-on knowledge through the problem solving based approach of the course along with working on the skill set at the end of the course.

SKILLS ACQUIRED:

- ✓ Learn to apply data science methods and techniques, and acquire analysis skills.
- ✓ Basic data manipulation & data cleaning using Python and pandas Regular Expressions

ACTIVITIES:

- ✓ Taking the large amounts of data and finding vector length, min, mode, max and average of that data.
- ✓ Applying list operations on big data for data interpretation.
- ✓ Converting list data into data frames and performing various operations on the data frames.
- ✓ Reading the data from various formats and converting them into required formats.

UNIT – I

Introduction to data science, Python basics, Data processing using arrays, file input/output with arrays.

UNIT – II

Introduction to pandas data structure, computing descriptive statistics, essential functionality, Handling missing data.

UNIT – III

Reading and writing data with text format, Binary data formats, interacting with HTML and web API's

UNIT – IV

Combing and merging data sets, data transformation and string manipulation.

UNIT – V

Date and time data types and tools, Time series basics, Time zone handling.

Test Book:

1. Wes McKinney, "Python for data analysis", 1st Edition, O'Reilly Media, 2012:

Reference Books:

1. Joel Grus,"Data Science from Scratch", O'Reilly Media Inc., 2015.
2. Cathy O'Neil and Rachel Schutt, "Doing Data Science", O' Reilly Media Inc., 2013.

MECHANICAL ENGINEERING

16ME255 3D PRINTING TECHNOLOGY

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objectives:

This course offers the basic Introduction to 3D Printing, its evolution and gives exposure to the various available 3D printing processes. The objective of this course is to enable student to understand the concepts and implement 3D printing technologies to fabricate intricate & complex engineering components.

Course Outcomes:

The student would be able to:

- ✓ Understand the Basic 3D Printing concepts, its evolution, importance & exposure to the existing different 3D Printing Processes.
- ✓ Model and fabricate products using FDM technology.
- ✓ Apply 3D printing process that suits for the given application area.
- ✓ Analyze the effective process parameters that optimize the technology.

SKILLS ACQUIRED:

The student will be able to

- ✓ Understand the use of prototypes and their importance.
- ✓ Identify the conventional and non-conventional machine processes and choose the right depending on the requirement.
- ✓ Analyze the effect of process parameters on 3D fabricated components.
- ✓ Design process parameters that are suitable for manufacturing specific required products.
- ✓ Evaluate the effect of changing the parameters on the product output.
- ✓ Develop 3D products using latest 3D printing technologies.

ACTIVITIES:

- ✓ Design and fabricate universal coupling with FDM Technology.
- ✓ Fabricate planetary gear mechanism using ABS & PLA materials.
- ✓ Fabricate Engine block assembly by varying process parameters.

UNIT – I

Introduction: Need for the compression in product development, Comparison with conventional manufacturing, History of 3 D printing technology, Applications, Classification of RP systems.

UNIT – II

RP Process: Liquid Type : Principle, process parameters, process details and applications of Stereo lithography systems, Solid Ground Curing, Liquid Thermal Polymerization (LTP), Beam Interference Solidification (BIS)

UNIT - III

RP Process: Solid type : Principle, process parameters, process details and applications of Laminated Object Manufacturing, Fused Deposition Modeling, Ballistic Particle Manufacture (BPM)

UNIT – IV

RP Process: Powder type : Principle, process parameters, process details and applications of Laser Engineered Net Shaping, 3D Printing, Selective Laser Sintering

UNIT – V

RP Process Optimization : Rapid Manufacturing Process: Rapid Manufacturing Process Optimization-Factors influencing accuracy -data preparation errors, part building errors, errors in finishing, influence of part build orientation.

Text Books:

1. Pham D T and Dimov S S, “Rapid Manufacturing”, Verlag, 2001.
2. Paul F Jacobs, “Stereo Lithography and other RP&M Technologies”,
3. Terry Wohlers, “Wohlers Report 2001”, Wohlers Associates,2008.

16ME367 REVERSE ENGINEERING

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objectives:

Reverse Engineering (RE) is an effective learning technique if other "solutions" are available on the market. Applying reverse engineering methodologies allow engineers to disassemble and re-assemble of the device, taking care to document, test, analyze and report on the study of its function.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the Reverse Engineering (RE) Methodology
- ✓ Disassemble products and specify the interactions between its subsystems and their functionality
- ✓ Understand Computer-Aided RE and Rapid Prototyping Technology
- ✓ Re-draw electrical schematics from available PCBs
- ✓ Understand RE applications in software engineering
- ✓ Create minimal cost base product life cycle designs with higher reliability.

SKILLS ACQUIRED:

The student will be able to

- ✓ The basic understanding of engineering systems.
- ✓ Understanding the terminologies related to re-engineering, forward engineering, and reverse engineering.
- ✓ The Understanding of Reverse Engineering methodologies.
- ✓ Understanding of Reverse engineering of Systems, Mechanical RE, Electronic RE, and Computer RE.

ACTIVITIES:

- ✓ The students will be given asked to disassemble any of an engineering product and to apply RE methodologies.
- ✓ The students will be asked to write a technical report documenting their work in the project.
- ✓ Communication diagram will be given as assignments.
- ✓ The group of students which has performed their project in a good way have to present their findings using the communication skills e.g. Power point presentations.
- ✓ The practical skills are applied in the project assigned for the students visiting this course.

UNIT – I

Introduction : Scope and tasks of RE - Domain analysis- process of duplicating

UNIT – II

Tools for RE : Functionality- dimensional- developing technical data - digitizing technique construction of surface model - solid-part material- characteristics evaluation – software and application- prototyping – verification

UNIT – III

Concepts : History of Reverse Engineering – Preserving and preparation for the four stage process – Evaluation and Verification- Technical Data Generation, Data Verification, Project Implementation.

UNIT – IV

Data Management : Data reverse engineering – Three data Reverse engineering strategies – Definition –organization data issues - Software application – Finding reusable software components – Recycling real-time embedded software – Design experiments to evaluate a Reverse. Engineering tool – Rule based detection for reverse Engineering user interfaces – Reverse Engineering of assembly programs: A model based approach and its logical basics

UNIT – V

Integration : Cognitive approach to program understated – Integrating formal and structured methods in reverse engineering – Integrating reverse engineering, reuse and specification tool environments to reverse engineering -–coordinate measurement – feature capturing –surface and solid members.

Text Books:

1. Design Recovery for Maintenance and Reuse, T J Biggerstaff, IEEE Corpn. July 1991
2. White paper on RE, S. Rugaban, Technical Report, Georgia Instt. of Technology, 1994
3. Reverse Engineering, Katheryn, A. Ingle, McGraw-Hill, 1994
4. Data Reverse Engineering, Aiken, Peter, McGraw-Hill, 1996
5. Reverse Engineering, Linda Wills, Kluiver Academic Publishers, 1996
6. Co-ordinate Measurment and reverse engineering, Donald R. Honsa, ISBN 1555897, American Gear Manufacturers Association

16ME368 SAFETY ENGINEERING

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objectives:

This course was designed to make the Mechanical Engineers to monitor and increase standards of the safety in various industries. This course was included with techniques, methodologies and tools to prevent unsafe operations and accidents.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the safety rules and regulations, standards and codes
- ✓ Identify importance of safety in operation of various machines and equipment used in industry.
- ✓ Investigate the accidents in industries.
- ✓ Develop knowledge related to safety education and training.
- ✓ Improve health and welfare measures in engineering industry
- ✓ Create minimal cost base product life cycle designs with higher reliability.

SKILLS ACQUIRED:

The student will be able to

1. Implement safety engineering techniques in various industries.
2. Investigate the accidents and prepare a report over the accident investigation.
3. Evaluate safety performance and monitor the safety.
4. Design preventive maintenance in health and welfare of workers' aspects in engineering and industry.
5. Development process.

UNIT – I

CONCEPTS : Evolution of modern safety concept- Safety policy - Safety Organization - line and staff functions for safety- Safety Committee- budgeting for safety.

UNIT – II

TECHNIQUES: Incident Recall Technique (IRT), disaster control, Job Safety Analysis (JSA), safety survey, safety inspection, safety sampling, Safety Audit.

UNIT – III

ACCIDENT INVESTIGATION AND REPORTING: Concept of an accident, reportable and non reportable accidents, unsafe act and condition – principles of accident prevention, Supervisory role- Role of safety committee – Accident causation models - Cost of accident. Overall accident investigation process - Response to accidents, India reporting requirement, Planning document, Planning matrix, Investigators Kit, functions of investigator, four types of evidences, Records of accidents, accident reportsClass exercise with case study.

UNIT – IV

SAFETY PERFORMANCE MONITORING : Reactive and proactive monitoring techniques - Permanent total disabilities, permanent partial disabilities, temporary total disabilities - Calculation of accident indices, frequency rate, severity rate, frequency severity incidence, incident rate, accident rate, safety "t" score, safety activity rate – problems.

UNIT – V

SAFETY EDUCATION AND TRAINING: Importance of training-identification of training needs-training methods – programme, seminars, conferences, competitions – method of promoting safe practice - motivation – communication - role of government agencies and private consulting agencies in safety training – creating awareness, awards, celebrations, safety posters, safety displays, safety pledge, safety incentive scheme, safety campaign – Domestic Safety and Training.

Text Books:

16ME457 PRODUCT LIFE CYCLE MANAGEMENT

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
20	48	4	12	2	2

Course Description and Objectives:

This course deals with in-depth concepts of product development through its life cycle at various stages. The objective of this course is to enable the students to develop an optimal product life cycle designs.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand the concepts and significance of product life cycle management.
- ✓ Develop suitable strategic plan in accordance with customer requirements and company policy.
- ✓ Build optimal process plans and work flow from start to end of product manufacturing.
- ✓ Evaluate process controllability charts to monitor outliers of process parameters.
- ✓ Create minimal cost base product life cycle designs with higher reliability.

SKILLS ACQUIRED:

The student will be able to

- ✓ Design a life cycle chart of any engineering product.
- ✓ Create suitable PLM strategy with respect to customer requirement
- ✓ Identify tools required and work process flow for a given product.
- ✓ Analyze process control using SPC Charts.
- ✓ Perform failure mode effect analysis of a product
- ✓ Develop appropriate soft computing algorithms in product development process.

ACTIVITIES:

- ✓ Formulate a process plan for production of Gear Box
- ✓ Identify the nonconformance of washers in a given lot
- ✓ Perform failure mode analysis of a rotor system

UNIT – I

INTRODUCTION: Background, Overview, Need, Benefits, Concept of Product Life Cycle. Components / Elements of PLM, Emergence of PLM, Significance of PLM, Customer Involvement.

UNIT – II

PRODUCT LIFE CYCLE ENVIRONMENT: Product Data and Product Workflow, Company's PLM vision, The PLM Strategy, Principles for PLM strategy, Preparing for the PLM strategy, Developing a PLM strategy, Strategy identification and selection, Change Management for PLM.

UNIT – III

PRODUCT DEVELOPMENT PROCESS & METHODOLOGIES : Integrated Product development process - Conceive – Specification, Concept design, Design - Detailed design, Validation and analysis (simulation), Tool design, Realize – Plan manufacturing , Manufacture, Build/Assemble , Test (quality check) , Service - Sell and Deliver , Use , Maintain and Support, Dispose. Bottom-up design, Top-down design, Front loading design workflow, Design in context, Modular design.

UNIT – IV

PRODUCT DEVELOPMENT METHODOLOGIES & ANALYSIS TOOLS: Concurrent engineering - work structuring and team Deployment - Product and process systemization - problem, identification and solving methodologies. Product Reliability, Mortality Curve. Design for Manufacturing, Design for Assembly. Design for Six Sigma.

Probabilistic design concepts-FMEA-QFD-Taguchi Method for design of experiments - Design for product life cycle. Estimation of Manufacturing costs, Reducing the component costs and assembly costs, Minimize system complexity

UNIT – V

RECENT ADVANCES : Intelligent Information Systems - Knowledge based product and process models - Applications of soft computing in product development process - Advanced database design for integrated manufacturing.

Text Books :

3. Stark, John. Product Lifecycle Management: Paradigm for 21st Century Product Realisation, Springer-Verlag, 2004. ISBN 1852338105
4. Product Design & Process Engineering, McGraw Hill – Kogalkusha Ltd., Tokyo, 1974.

16ME256 BASICS IN ROBOTICS

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
		-

WA/RA	SSH/HSH	CS	SA	S	BS

Course Description and Objectives:

This course deals with the classification of robots, forward and inverse kinematics, end-effectors, various types of actuators and sensors and basics in control systems. The objective of this course is to learn the basic concepts of robots and try to develop the robots for societal needs.

Course Outcomes:

The student will be able to:

- ✓ Discuss the concept of brief history of robot, construction and various types of links and joints of a manipulator.
- ✓ Calculate the forward and inverse kinematics for various configurations of the robotic manipulators.
- ✓ Design the robot end effectors and its sensors for customized applications.
- ✓ Acquire knowledge about various sensors, actuators and control systems
- ✓ Demonstrate the concept of concept basic control system and its applications.

SKILLS TO BE ACQUIRED:

- ✓ Specify the various types of robots based on coordinates systems.
- ✓ Determine the position and orientation of the end effecter with respect to base frame.
- ✓ Design and analysis of various types of grippers.
- ✓ Specify the actuators and sensors based on applications.

UNIT-1 **L-12**

INTRODUCTION: Introduction to Robotics, Laws of Robotics, Classifications by coordinate system, Robot components, Degree of freedom, Robot links and joints, Work space analysis, Applications of Robots.

UNIT-2 **L-12**

KINEMATICS: Coordinate frames, Mappings: Changing descriptions from frame to frame, Translations, Rotations and Transformations, Kinematic Modelling of the manipulator, D-H Representation, Forward Kinematics and Inverse Kinematics.

UNIT-3 **L-12**

END EFFECTORS: Classification of end effectors, Tools as end effectors, Drive system for grippers, Mechanical, Adhesive, Vacuum, Magnetic grippers. Gripper force analysis and gripper design. Active and passive grippers.

UNIT-4 **L-12**

ACTUATORS & SENSORS: Pneumatic, Hydraulic actuators, Electric actuators: Servomotor, Stepper motors. Feedback components: Sensors. Types and applications, Position sensors, Potentiometers, Resolvers, Encoders, Velocity sensors.

UNIT-5 **L-12**

CONTROL SYSTEMS-I: Introduction to control systems, Open loop and closed loop systems, Elements of closed loop systems, Block diagram reduction techniques, Transfer function, Mechanical and Electrical Systems.

16ME369 ADVANCES IN ROBOTICS

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
		-

WA/RA	SSH/HSH	CS	SA	S	BS

Course Description and Objectives:

This course introduces the concept of Jacobian analysis, dynamics, trajectory planning, control systems and various programming languages. The objective of this course is to learn the advance concepts in robotics and try to develop the robots for industrials needs.

Course Outcomes:

The student will be able to:

- ✓ Analyze the concept of jacobian and its inverse jacobian for manipulators.
- ✓ Develop equation of motion for 2 DOF RR manipulators.
- ✓ Evaluate various robot trajectory planning techniques.
- ✓ Explore different control systems for customized robotics applications.
- ✓ Build programs for various tasks using robot programming languages.

SKILLS TO BE ACQUIRED:

- ✓ Apply the knowledge of singularity conditions and identify the joint velocity.
- ✓ Determine the torque required for each joint of the robot.
- ✓ Specify the path between the start and end points of manipulator.
- ✓ Learn the state space analysis and Matlab programming.

.

UNIT-1 **L-12**

DIFFERENTIAL MOTION OF MANIPULATOR: Introduction to Jacobian, Manipulator Jacobians for serial manipulators, Jacobian Inverse, Jacobian Singularities, Static Analysis, Problems related to Jacobian analysis.

UNIT-2 **L-12**

ROBOT DYNAMICS: Mass and inertial of links, Lagrangian formulation for equations of motion for serial manipulators, Kinetic and potential energy, Lagrangian-Euler dynamic mode., Direct and inverse dynamics.

UNIT-3 **L-12**

TRAJECTORY PLANNING: Introduction to Trajectory planning, Definitions and planning tasks, Joint space techniques, Cartesian space techniques, Joint-space versus Cartesian space trajectory planning.

UNIT-4 **L-12**

CONTROL SYSTEMS-II: Steady State error and coefficients, Root locus concepts, Stability, State space analysis, Introduction to linear control systems, Second order linear control systems and its characteristics, Linear second order SISO model.

UNIT-5 **L-12**

ROBOT PROGRAMMING: Introduction, Methods of Robot Programming, On line programming, Teach pendant control, Lead through programming, Capabilities and Limitations of lead through methods.

16ME370 FIELD AND SERVICE ROBOTS

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
		-

WA/RA	SSH/HSH	CS	SA	S	BS

Course Description and Objectives:

This course deals with the concept of field and service robots, various path planning algorithms, various mobile robots using different environments and usage of robots in various industrial applications. The objective of this course is to learn the usage of mobile robots in real time environments and industrial applications.

Course Outcomes:

The student will be able to:

- ✓ Explore various field and service robots and its applications.
- ✓ Discuss the concept of localization, map representation and vision for mobile robots.
- ✓ Acquire the knowledge about robot motion planning algorithms.
- ✓ Understand various applications of mobile and field robots.
- ✓ Demonstrate the robots used in various industrial applications.

SKILLS TO BE ACQUIRED:

- ✓ Apply the knowledge of field and service robots.
- ✓ Learn various path planning algorithms.
- ✓ Explain the localization of map and inspection
- ✓ Learn the concept of robots used in different applications.
  .

UNIT-1 **L-12**

INTRODUCTION: History of service robotics, Present status and future trends, Need for service robots, Applications, Examples and Specifications of service and field Robots.

UNIT-2 **L-12**

LOCALIZATION & INSPECTION
Introduction-Challenges of Localization- Map Representation- Probabilistic Map based Localization.
Robotic vision systems, image representation, object recognition and categorization, depth measurement, image data compression, visual inspection, software considerations.

UNIT-3 **L-12**

PLANNING & NAVIGATION: Introduction to path planning, Road map path planning, Cell decomposition path planning, Potential field path planning, Obstacle avoidance.

UNIT-4 **L-12**

MOBILE & FIELD ROBOTS: Wheeled and legged robots, vision, touch, sound, Vision, Tactile Sensing. Performance, Interaction, Safety and robustness, Applications.
Ariel robots- Collision avoidance-Robots for agriculture, mining, exploration, underwater, civilian and military applications, nuclear applications, Space applications.

UNIT-5 **L-12**

INDUSTRIAL APPLICATIONS: Types of industrial robots, Load handling capacity, general considerations in Robotic material handling, material transfer, machine loading and unloading, Robot centered cell. Application of Robots in continuous arc welding, Spot welding, Spray painting, assembly operation, cleaning robot for underwater applications.

16ME458 ARTIFICIAL INTELLIGENCE FOR ROBOTS

Hours Per Week:

L	T	P	C
4	-	-	4

Total Hours:

L	T	P
		-

WA/RA	SSH/HSH	CS	SA	S	BS

Course Description and Objectives:

This course deals with the concept of artificial intelligence for robots, problem solving, planning algorithms, reasoning techniques, various learning methods used in various applications. The objective of this course is to develop the AI concepts in various mobile robots in real time environments.

Course Outcomes:

The student will be able to:

- ✓ Explore the concept of AI in Robotics and its problem solving.
- ✓ Acquire the knowledge about various planning algorithms.
- ✓ Develop the concept of various reasoning techniques.
- ✓ Discuss various types of learning methods using in AI.
- ✓ Apply AI concepts on various robotics planning algorithms.

SKILLS TO BE ACQUIRED:

- ✓ Learn the concept of artificial intelligence and problem solving in AI.
- ✓ Solve the various planning algorithms used in AI.
- ✓ Explain the concept of various reasoning techniques and learning methods used in AI
- ✓ Learn the concept AI in robots.

.

UNIT-1 **L-12**

INTRODUCTION:

Introduction to AI, History, state of the art, Need for AI in Robotics. Thinking and acting humanly, intelligent agents, structure of agents.

PROBLEM SOLVING: Solving problems by searching –Informed search and exploration–Constraint satisfaction problems–Adversarial search, knowledge and reasoning–knowledge representation – first order logic.

UNIT-2 **L-12**

PLANNING

Planning withforward and backward State space search – Partial order planning – Planning graphs–Planning with propositional logic – Planning and acting in real world.

UNIT-3 **L-12**

REASONING

Uncertainty – Probabilistic reasoning–Filtering and prediction–Hidden Markov models–Kalman filters–Dynamic Bayesian Networks, Speech recognition, making decisions.

UNIT-4 **L-12**

LEARNING

Forms of learning – Knowledge in learning – Statistical learning methods –reinforcement learning, communication, perceiving and acting, Probabilistic language processing, perception.

UNIT-5 **L-12**

AI IN ROBOTICS

Robotic perception, localization, mapping- configuring space, planning uncertain movements, dynamics and control of movement, Ethics and risks of artificial intelligence in robotics.

TEXT BOOKS:

1. Stuart Russell, Peter Norvig, "Artificial Intelligence: A modern approch", Pearson Education, India2003.

2. Negnevitsky, M, "Artificial Intelligence: A guide to Intelligent Systems",. Harlow: Addison-Wesley, 2002.

MANAGEMENT

16MS202 PRINCIPLES AND PRACTICE OF MANAGEMENT

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

The main object of the course is to explain about concepts, principles and practice of management. To imbibe in-depth knowledge to the students on planning, decision making, organizing and directing and controlling aspects of management.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Understand principles of management and functions including planning, organizing, directing and controlling
- ✓ Understand concepts of managing people including motivating, leading and communication
- ✓ Improve ability to examine managerial issues and problems and to develop feasible alternatives that can result in better decision making
- ✓ Develop an awareness of multiple approaches that can be used to resolve managerial problems
- ✓ Importance of managerial economics in business decision making
- ✓ Demand concepts and methods of demand forecasting
- ✓ Production function and law of variable proportions
- ✓ Cost concepts and break even analysis
- ✓ Pricing decisions in various market situations

UNIT – I

Introduction to Management: Concept of management, Management functions, Managerial roles, skills and levels, Is management science or art?, History and current thinking: Classical approach ,Behavioral approach ,Management science approach ,The contingency approach ,The systems approach.

UNIT -II

Planning & Decision Making: Concept of planning ,Purpose of planning ,Planning process, Management by objectives, Defining decision making ,Types of decisions ,Decision making process ,Decision making conditions, Group decision making and ,Decision trees

UNIT – III

Organizing: Concept of organizing, organizing process, Organization structures, departmentation, Responsibility, authority and delegation, span of management

UNIT – IV

Directing: Concept of motivation, Theories of motivation: Process theories of motivation, Content theories of motivation, Strategies for motivating organization members, Concept of leadership, Trait approach to leadership, Situational approach to leadership , Communication process, Barriers to communication, Interpersonal communication in organization

UNIT - V

Controlling: Concept of controlling, Controlling process, Types of control, Techniques of controlling

Text Books:
1. Samuel C.Certo, S.Trevis Certo: Modern Management, 10/e, Prentice-Hall, New Delhi, 2007
2. Stoner, Freeman, and Gilbert, Jr. Management, 6/e, Pearson education, New Delhi, 2006.

Reference Books:
1. Heinz Weihrich, Harold Koontz: Management A Global perspective, 10/e, Tata McGraw Hill, 2007.
2. Daft, The New Era of Management, Thomson, 7/e, New Delhi, 2007.
3. Schermerhorn: Management, 8/e, Wiley, India, 2006.

16MS301 MANAGERIAL ECONOMICS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

To make the students familiar with the basic concepts and principles of Business Economics.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Importance of managerial economics in business decision making
- ✓ Demand concepts and methods of demand forecasting
- ✓ Production function and law of variable proportions
- ✓ Cost concepts and break even analysis
- ✓ Pricing decisions in various market situations

UNIT – I

Introduction to Economics-Wealth, Welfare and Scarcity Definitions, Classification and Scope of Economics, Nature & Scope of Managerial Economics, Basic tools and techniques of Business Economics, Relation of Managerial Economics with functional areas of business.

UNIT – II

Demand Analysis: Types of Demand, Demand determination, Concept of Elasticity and measurement, Demand forecasting, Survey & Statistical methods.

UNIT – III

Theory of Production: Production function, Marginal rate of technical substitution, Iso-quants and Iso-costs, production function with one/two variable factors, Law of Variable Proportions, and Returns to Scale, internal and external economies.

UNIT – IV

Cost Analysis: Cost concepts, cost determinants, cost output relationship in the short and long run, Break-Even analysis, Simple problems in Break-even Analysis.

UNIT – V

Features and types of different competitive situations – Perfect competition, Monopoly, Monopolistic competition and Oligopoly, pricing methods in practice.

Text Books:

1. Gupta: Managerial Economics, 1/e TMH, 2005.
2. A.R.Arya Sri, Managerial Economics and Financial Analysis, TMH, 2/e, 2010.

Reference Books:

1. Dominic Salvatore, Managerial Economics, Thomson, 2/e, 2006

16MS302 FINANCE FOR ENGINEERS

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Helping non-financial professionals like Engineers to raise their awareness of finance and use financial information in making better business decisions
Provides an understanding of the basic financial accounting terms and concepts like financial statements - balance sheet, income statement, statement of cash flows, that firms use to describe their businesses

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ By raising financial awareness, students are better able to manage businesses' revenues, costs, profits and cash.
- ✓ Students will also be able to use their new financial knowledge to make more effective decisions.

UNIT – I

Introduction to Financial statements -main components of a typical set of financial statements or annual report - key underlying accounting concepts used in the preparation of financial statements.

UNIT – II

Business Analysis - Know how to interpret financial statements and analyze businesses using the 7-step approach - Perform a SWOT analysis using financial statements

UNIT – III

Cash Operating Cycle - cash operating cycle and what affects a company's cash flow - Manage the cash operating cycle

UNIT – IV

Costing - Different categories of costs which exist and their implication on costing - costing concepts, and apply them in making business decisions-Break-even analysis

UNIT – V

Investment Appraisal Tools - payback period, net present value and internal rate of return methods of project appraisal in decision making - Understand briefly the concepts of shareholder value, gearing and weighted average cost of capital

Text Books:

1. Accounting for Non-Accounting Students" by JR Dyson, Pearson.

2. Ross, Stephen A., Westerfield, Randolph W. and Jordan, Bradford D., Essentials of Corporate Finance with Connect Plus. Seventh Edition. New York, NY, Mc-Graw Hill Irwin 2008. ISBN 978-0-07-742768-9.

16MS401 ENGINEERING ENTREPRENEURSHIP

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Engineering Entrepreneurship introduces engineering students to the concepts and practices of technology entrepreneurial thinking and entrepreneurship. The course is firmly presented in a "real-world" format, including students taking the roles of company founders and investors, creating a vision and execution plan for their company, and raising funds –exactly as they would in a true entrepreneurial endeavour. Using lectures, case studies, business plans, and student presentations, the course teaches life skills in entrepreneurial thought.

Course Outcomes:

Upon successful completion of this course, the students will be able to:

- ✓ Concepts and practices of technology entrepreneurial thinking and entrepreneurship.
- ✓ Entrepreneurial mind-set and culture that has been developing in companies of all sizes and industries
- ✓ Entrepreneurial process from the generation of creative ideas to exploring feasibility to creation of an enterprise for implementation of the ideas.
- ✓ How to create and present a business plan for a technology idea. Students will experience the dynamics of participating on a business team and the power inherent in a team relative to individual effort.
- ✓ Tools and life skills required to participate in the entrepreneurial process within a large company, in a new venture, or as an investor Plan and control the HR function effectively

UNIT – I

Introduction to Entrepreneurship, Introduction to Technology, Entrepreneurship and Technology Ventures, Attributes and Myths of Technology Entrepreneurs

UNIT – II

Engineers as Entrepreneurs, The Mind-set of the Entrepreneurial Leader, Creating and Selling the Entrepreneurial Value Proposition.

UNIT – III

Entrepreneurial Idea Generation and Feasibility Analysis, Technology Commercialization Potential, Paths and Barriers from Idea to Market, Assessing and Presenting the Opportunity.

UNIT – IV

Business Structuring and Strategy, Business planning and the Business Plan, Financial Analysis and Projections; Market and Competitive Analysis, Presentation of the Opportunity,

UNIT – V

Intellectual Property Strategies for Technology Companies; Marketing, Sales and Distribution Strategies, Investment and Financial Strategies, Venture Growth and Value Harvesting.

Text Books:

1. H. Nandan, "Fundamentals of Entrepreneurship", 5th ed., PHI, New Delhi, 2007.
2. Technology Ventures: From Idea to Enterprise, 3rd Edition, Dorf, Richard, Byers, Thomas, and Nelson, Andrew; ISBN 978-0073380186
3. New Venture Creation, 6thEdition or 5thEdition, Timmons, Jeffry A; ISBN:0072498404, January 2004.

Reference Books:

3. Dr. C. B. Gupta, Dr. N.P. Srinivasan "Entrepreneurship Development in India", 5th ed., Sultan Chand & Sons, New Delhi.
4. The Art of the Start: The time-tested, battle-hardened guide for anyone starting anything, Kawasaki, Guy; ISBN: 1591840562, Portfolio – a member of Penguin Group; 2004 Monk & the Riddle, Komisar, Randy; ISBN: 1578516447, Harvard Business School Press; September 2001.

HUMANITIES

16HS219 INDIAN HISTORY AND CULTURE

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course introduces basic understanding of Indian culture and history. The course objective is to describe the various stages of the Indian history, understand the importance of different historical events in shaping the Indian society and to enable the students understand the relevance of Indian history and make them much more socio-conscious in the society.

Course Outcomes:

Upon successful completion of this course, the student will be able to

1) To acquaint the students with the Indian history and culture.
2) To prepare the students for the civil services examinations [as Indian history is very important both at the prelims and mains level].
3) To make the students more inclined knowing Indian history not only from the examination point of view but to feel proud of our rich cultural heritage [literature, music, sculpture, art, architecture].
4) To make the students balanced individuals, responsible in protecting and glorifying our history.

SKILLS TO BE ACQUIRED:

- ✓ Mapping historical places since ancient to modern
- ✓ Compare different perspective to reading or understanding of history/historical events
- ✓ Prepare essays with broad historical understanding
- ✓ Identify major turn of events and evaluate the historical development of Indian society since ancient time

ACTIVITIES:

- ✓ Presentation on Ancient Indian History
- ✓ Group discussion on different viewpoints and interpretation of history
- ✓ Paper presentation on the visit to the museum and archives
- ✓ Group discussion on different religion and their importance
- ✓ Interactive sessions about the evolution of the Indian society since ancient to modern

UNIT - I

Ancient Indian History : Prehistoric Background of Indian culture. Harappan culture: Cities – Society – economy and trade , End of the Harappan cities. Society and Economy of the early Vedic and later Vedic periods. Emergence and Spread of Puranic thesim, Buddhism and Jainism. Mauryans, Post Mauryans and Sangam Period. The age of Satavahanas and the Guptas The Pallavas, the Chalukyas and the Cholas.

UNIT –II

Medieval Indian History : General Condition under the Delhi Sultanate. General Condition under the rulers of the Vijayanagara Empire. General Conditions under the rule of the Mughals Shivaji and the rise of the Marathas. Bhakti Movement

UNIT – III

Indian Culture : Salient aspects of Art forms – Music and Dance Language and Literature , Architecture and Sculpture, Paintings and places of Cultural interest

UNIT –IV

British Rule in India : The Beginning of European settlements. Government and the economic policies of the British empire in India 1757 – 1857. The First War of Independence of 1857 and the consequent administrative changes. Religious and Social Reforms after 1858.

UNIT – V

Struggle for freedom : Economic impact of the British rule The national Movement 1858-1885; 1885-1905; 1905-1920; 1920-1947 Contribution from various states India after Independence-Post independence consolidation of states.

Text Books :

1. Romila Thapar A History of India –I – Penguin Books
2. Percival Spear A History of India –II – Penguin Books

References Books :

1. S.L. Mukharjee Ancient History of India, Tata Mc Graw Hill,2008
2. S.L. Mukharjee Medieval History of India,Tata Mc Graw Hill,2008
3. Bipin Chandra Indian Struggle of Independence, Viking , 2007.
4. A.L Basham (ed) A Cultural History of India , Oxford, 1975.

16HS224 POLITY AND GOVERNANCE OF INDIA

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course introduces basic understanding of Indian polity and constitution. The course objective is to make students to understand the functioning of government at the centre and state level besides local self government as outlined in the constitution and gives basic knowledge about the fundamental rights & duties of a citizen besides gives the knowledge about Elections and Democracy at work.

Course Outcomes:

The student will be able to:

- ✓ Applies the constitution and its principles to the day to day happenings.
- ✓ Inculcates the respect for the constitution and rights of others besides safeguarding one's own rights.
- ✓ Analyzes functioning of executive, legislative and Judiciary.
- ✓ Compares the Indian constitution with other countries

SKILLS:

- ✓ Analyze political events of the nation.
- ✓ Study and compare various contemporary governments and constitutions
- ✓ Analyze the functions of the government authorities

ACTIVITIES:

- ✓ Conduct mock parliament.
- ✓ Evaluate political changes in the country
- ✓ Visits government offices(Chebrolu MRO&MPDO)
- ✓ Group discussion on basic human rights and gender sensitivity
- ✓ Conduct mock panchayat meetinings

UNIT – I

Overview of Indian constitution : Making of Indian constitution, Salient features, Preamble, Significant Provisions; Amendments; Basic structure.

UNIT – II

Working of the Indian Constitution : Features of Indian Federal system, Centre-State relations- Legislative, executive, financial, Issues and concerns – coalition governments; Administrative, Reforms.

UNIT – III

Structure of the Government : Union Government, State Government, Local Government

UNIT – IV

Powers and Functions of Constitutional, Statutory and Non statutory bodies : Constitutional - Election Commission, UPSC, Finance Commission, CAG etc., Statutory - NHRC, CVC, etc., Non statutory – Planning Commission, National Development Council etc.,

UNIT – V

Political Dynamics : Representation of Peoples' Act, Political Parties, Pressure Groups, Elections, Electoral Reforms, Transparency, Accountability and Right to Information.

TEXT BOOKS:

1. D.D. Basu—Indian Constitution
2. Subhash C. Kashyap : Our Parliament, Publication Division

References:

1. P.M. Bakshi—Indian Constitution
2. Laxmikanth, Indian Polity

16HS307 ECONOMIC AND SOCIAL DEVELOPMENT OF INDIA

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

This course introduces basic understanding of Indian economy. The course objective is to make students to understand the role of government in managing economy and gives basic knowledge about different sectors of the economy besides equipping them the tools to analyze the state of current economy.

Course Outcomes:

The student will be able to:

- ✓ Applies the macro economics techniques and its principles to the day to day happenings.
- ✓ Inculcates the respect for the constitution and rights of others besides safeguarding one's own rights.
- ✓ Analyzes functioning of state of economy.
- ✓ Analyzes the impact of external sector on Indian economy

SKILLS TO BE ACQUIRED:

- ✓ Calculate GDP,NI,CPI,WPI
- ✓ Monitor the stock markets and foreign trade
- ✓ Analyze social evils like poverty, unemployment etc
- ✓ Analyze Industrial growth and functioning of the banking sector

ACTIVITIES:

- ✓ Study market fluctuation
- ✓ Visit banks and corporate offices
- ✓ Analze the impact of globalization on the Indian economy
- ✓ Practical knowledge on patent rights
- ✓ Compare popular programmes of different government

UNIT - I

Structure of the Economy : Basic Concepts, Sources of Revenue and classification of, expenditures of Union, Government, Fiscal indicators, Structure of the Economy, Recent trends in the National Income, Performance on the social front.

UNIT – II

LPG Policies : Transition from Centralized Planning to Indicative Planning, LPG Policies, Globalization and its discontents, WTO, TRIPS, TRIMS, GATS.

UNIT – III

Agrarian Issues : Agrarian Structure, Land Reforms ,Farm subsidies, Agricultural Price Policies, Food Security Agrarian Crisis and Farmer suicides, WTO and Indian Agriculture

UNIT – IV

Industrial Strategy : Strategy of Industrialization, Special Economic Zones, FDI Policy Multi-National Companies and their importance, Rise of Corporate power in India, Privatization and Disinvestment policies, Infrastructure policies

UNIT – V

Poverty Alleviation Programmes : Measures of Poverty and inequality and trends therein. Anti Poverty Programmers - Public Distribution System Wage Employment Programmes Concepts of Social justice and Inclusive growth and their components.

TEXT BOOKS:

1. Dutt and Sundaram: “Indian Enconomy”, 2014 edition, S. Chand & Co.
2. Misra & Puri: “Indian Economy”, 2014 edition, Himalaya Publications.

REFERENCE BOOKS:

1. Vivek Kumar Singh: “CSAT Comprehensive Manual” 2014 edition.
2. Joseph E. Stigltz (2003) : “Globalization and its Discontents” W.W Norton,
3. Jean Dreze and Amartya Sen (2014) : “An Uncertain Glory : India and its Contradictions” Penguin.
4. Ramesh Singh (2014): “Indian Economy for Civil Services Examinations”, Mc Graw Hill.

16HS308 GEOGRAPHY AND ENVIRONMENTAL CONCERNS OF INDIA

Hours Per Week:

L	T	P	C
3	1	-	4

Total Hours:

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
10	30	5	10	5	5

Course Description and Objectives:

Students will be introduced to various phenomena like El-Nino, Global

Warming both at Global and Regional levels and several physiographic phenomena like origin and distribution of Earth quakes, volcanoes tsunamis and resources.

Course Outcomes:

The student will be able to:

- ✓ Analyses oceanic and climatic phenomena.
- ✓ The students will analyze the regional issues inconsonance with global happenings.
- ✓ Student will apply general principles of geography and environment and can provide the solutions.
- ✓ Inculcates environment consciousness.

SKILLS TO BE ACQUIRED:

- ✓ Map reading
- ✓ Discuss the oceanic and climatic phenomena
- ✓ Analyze the regional issues in consonance with global happenings
- ✓ Address geographic and environmental issues

ACTIVITIES:

- ✓ Presentation and group discussion on vital environmental issues
- ✓ Visit to IMD
- ✓ Study tidal movements
- ✓ Study different types of soils and climatic conditions
- ✓ Take part in a forestation drive nearby places

UNIT – I

Geography : Fundamental concepts of Geography, Physical Geography of India – River systems, climate, soils, minerals, geological Strata, climatic regions, natural vegetation, Races and Physical Types of People.

UNIT – II

Scientific and Technological Development : Milestones in India's scientific and technological progress in diverse fields – space, Nuclear, IT, Defense, Agriculture and Rural technologies Prominent scientists of India and their contribution, Recent initiatives to spread scientific temper and S&T practices, Issues relating to Intellectual Property Rights

UNIT – III

Energy Sources : Sources of Energy-availability and consumption pattern, Energy policy and pricing. Issues relating to hydel power (Big Dams), Thermal Plants and Nuclear power Green Energy technologies and their importance.

Unit – IV

Biodiversity : Meaning and importance of Bio-diversity, Sustainable Development Ecosystems and their management Bio-Diversity of India, Bio- spheres and Biodiversity hot spots of India Initiatives to preserve bio-diversity.

Unit – V

Environmental issues : Magnitude, causes and consequences of environmental pollution in India Factors that led to global warming and climate change Recent international protocols to tackle climate change, Carbon trading and its implications, Concerns of Developing Countries Disaster Management and Environmental Impact assessment.

TEXT BOOKS:

1. Goh Cheng Leong: Certificate Physical and Human Geography
2. Valdiya : Environmental Geology.

REFERENCE BOOKS:

1. NCERT: 6^{th} to 12^{th} Books for Geography
2. NCERT: General geography

MINOR SPECIALIZATIONS

D. ELECTRONICS & COMMUNICATION ENGINEERING

Minor-D Electronics & Communication Engg.	L	T	P	To	C
	4	0	-	4	4

EC223 ELECTRONIC DEVICES

Course Description and Objectives:

As part of this course, to deliver the knowledge about switches and relays, knowledge about physics of basic semiconductor devices. To enhance comprehension capabilities of students through understanding of electronic devices, introduce and motivate students to the use of basic power electronic devices and understand DC biasing needed for various applications.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Understand the semiconductor devices with the help of characteristics.

CO2: Investigate the characteristics of Amplifier Circuits employing BJT and FET devices.

CO3: Design half wave and full wave rectifiers with and without filters.

CO4: Analyze the working of BJTs and FETs under various biasing conditions.

UnitI -Surface Mounted Devices (SMDs)

Connectors, Relays and Switches: Various types of switches, e.g. Slide, rotary, push, Toggle etc, their symbols and applications. Concept of 'make' and 'brake' contacts in relays. Various types of relays and applications. Various types of connectors, their functions and applications

UnitII - Semiconductor Physics:

Intrinsic semiconductors, Conductivity, atomic and crystal structure of germaniumand silicon, covalent bonds, generation and recombination, effect of temperature on conductivity of intrinsic Semiconductors, energy levels diagram of conductor, insulators and intrinsic semiconductors, Extrinsic semiconductor materials - Doping of impurity, P and N type semiconductors and their conductivity, Minority and majority carriers~ Drift and Diffusion currents.

Unit III-Semiconductor Diodes & Rectifiers

P-N junction diode, mechanism of current flow in P-N junction, behaviour of P-N junction characteristics, Zenor diode, zener and avalanche breakdown, Tunnel diode, Schottky diode, Varactor diode,Light emitting diode.
Rectifiers: Half wave Rectifier, Full wave rectifier, Bridge rectifier and their comparisions

Unit IV- Introduction to Bipolar Transistor & FET & MOSFET

Introduction to Bipolar Transistorconcept of bipolar transistor as two junction three terminal device PNP and NPN transistors, their symbols. Input and output characteristics. Common emitter, base, Collector configurations.
FET: Construction, operation, characteristics and equivalent circuit of JFET and its circuit applications
MOSFET: Construction, operation, characteristics and equivalent circuit of MOSFET in depletion and enhancement modes and is circuit applications. Comparison of JFET, MOSFET, BJT.

Unit V-Regulators and Power semiconductor devices

Simple Zener Regulators, UJT, SCR, TRIAC DIAC, GTO, PUT, IGBT, SCS, SUS, RCT, LASCR

TEXT BOOKS:

1. S. Salivahanan “Electronic Devices and Circuits” Tata Mcgraw-Hill second edition
2. R.L.Boylestad and Lovis Nashelsky , “Electronic Devices and Circuits Theory”, 10th ed., Pearson Education, 2010.

EC250 ELECTRONIC CIRCUITS

Course Description & Objectives:

As part of this course, students to understand Diode switching circuits, to understand usefulness of the devices for various applications like amplifiers, oscillators etc. and understanding theoretical concepts of biasing and stabilization.

Course Outcome:

Upon successful completion of this course, students should be able to:

CO1: Analyzethe negative feedback amplifier circuits and oscillators.

CO2: Understand the working of tuned and power amplifiers.

CO3: Investigate the frequency response of multi stage and high frequency amplifiers.

CO4: Understand the time base generators.

UNIT I DIODE SWITCHING CIRCUITS

Diode as a switch, Diode clippers & Clampers. Clamping circuit theorem, practical clipping and clamping circuits. Realization of Logic Gates using Diodes: AND, OR gates using Diodes.

UNIT II- BIASING AND STABILIZATION

Dc load line, Ac load line and selection of operating point, need for biasing, various biasing techniques: fixed bias, collector to base bias and self bias with stability factors. Various compensation circuits, thermal runaway and thermal stability.

UNIT III- FEEDBACK CIRCUITS

Feedback Amplifiers: Concept and types of feedback, effects of negative feedback, Different topologies.

Oscillators: Barkhausen’s crieterion for oscillations, frequency of oscillations for Hartley , Colpitts, RC phase shift,Wein bridge and Crystal oscillators.

UNIT IV -POWER AMPLIFIERS

Classification of Power Amplifiers, Operation and Efficiency of Class A Series fed & transformer coupled, Class B Push Pull & Complimentary Symmetry, Class C Amplifiers and Comparisons.

UNIT V- MULTIVIBRATORS

Astable, Monostable and Bistable Multivibrators, Schmitt trigger using transistors.

TEXT BOOKS:

1. J. Millman and C.C. Halkias, “Integrated Electronics”, 1st ed., Tata McGraw-Hill , 2009.

EC228 DIGITAL ELECTRONICS

Course Description &Objectives:

To introduce the concepts and techniques associated with the number systems and codes and minimize the logical expressions using Boolean postulates. To design various combinational and sequential circuits and provide with anSufficient Number of applications for the techniques and mathematics used in this course.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Apply the Boolean algebra knowledge of mathematics to analyze combinational and sequential digital electronic circuits using K-map and QM technique.

CO2: Design combinational circuits for the given specifications/constraints.

CO3: Analyse the sequential circuits for the given specifications/constraints.

CO4: Compare the characteristics of logic families for implementing combinational & sequential circuits.

UNIT I - Number Systems and Boolean Algebra

Review of number systems, Conversions, Arithmetic operations, Binary codes: parity code, hamming code, Fundamental concepts of Boolean algebra, Basic theorems and properties, canonical and standard forms, logic gates, Algebraic simplification and realization with basic gates and universal gates.

UNIT II-Minimization of Switching Functions

Minimization of Switching Functions, Map method, prime implicants, don't care combinations, minimal SOP and POS forms, Tabular method, prime implicant chart.

UNIT III-Combinational Logic Design

Design using conventional Logic gates, Encoder, Decoder, Multiplexer, Demultiplexer, Parity bit generator, code converters, (Designing with gates along with mention of IC numbers), Basic PLDs : PAL, PLA, ROM, PROM

UNIT IV-Sequential Logic Design

Classification of sequential circuits, Latches, Flip-Flops: SR, JK, T, D; triggering and Excitation tables, Design of Sequential circuits: Shift Registers, counters, FSM, Sequence Detectors.

UNIT V-Logic Families

Introduction to logic families, CMOS logic, Bipolar logic, Transistor logic, TTL families, CMOS/TTL interfacing, low voltage CMOS logic and interfacing, Emitter coupled logic, Comparison of logic families

TEXT BOOKS:

1 Morris Mano, “Digital Logic & Computer Design”, 1st ed., Pearson, 2005.

EC333 COMMUNICATION SYSTEMS - I

Course Description & Objectives:

As part of this course, to familiarize students with the fundamentals of analog and digital communication systems and provide students with tools for communication signal analysis. To familiarize students with various techniques for amplitude modulation and demodulation of analog signals .

Course Outcomes:

Upon successful completion of this course, students should be able to::

CO1; Compare different amplitude modulation techniques.

CO2: Analyze performance of different types of Angle modulation Techniques for a given set of parameters.

CO3: Identify the transmitter and receiver types required for a given applications.

CO4: Familiarize the calculation of SNR in different modulation techniques.

UNIT I - Basic Signals and Fourier spectrum

Block diagram of communication system, Radio frequency spectrum:

Classification of signals, Fourier Transform of various signals, Fourier Spectrum, power spectral Density, Autocorrelation and Cross-correlation.

UNIT II - Amplitude Modulation and Demodulation

Modulation, Need for modulation, Amplitude modulation: AM. DSBSC, SSBSC and power and Bandwidth requirements; Generation of AM, DSB-SC, SSB - SC, Demodulation of AM: Envelope detector

UNIT III - Angle Modulation and Demodulation

Concept of Instantaneous frequency, Frequency and phase modulations, relationship and comparison between FM and PM. Narrowband and wideband FM. Generation of FM: Direct method, indirect method. Demodulation of FM: Phase locked loop (PLL).

UNIT IV -Digital communications

Sampling, Nyquist rate, Sampling theorem, Time Division multiplexing (TDM). Block diagram of PCM, Signal to Quantization noise ratio, Delta Modulation.

UNIT V - Digital Modulation

ASK, FSK, PSK and their modulation and Demodulations. Comparison between ASK, FSK and PSK with constellation diagrams.

TEXT BOOKS:

EC335 LINEAR IC APLICATIONS

Course Description & Objectives:

This subject introduces the theoretical & circuit aspects of Op-amp, which is the backbone for the basics of linear integrated circuits. To study the basic principles, configurations and practical limitations of op-amp and analyzing the designs and explain the characteristics and applications of active filters, including the switched capacitor filter understanding the operation of the most commonly used D/A and A/D converter types and its applications.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Understand the characteristics and specifications of operational amplifiers.

CO2: Analyze the applications of the operational amplifiers .

CO3: Design various filters and regulators.

CO4: Understand the operation and applications of phase locked loop and voltage controlled oscillators.

UNIT I- Basics of Op-amp

Classification of Integrated circuits, basic information of Opamp, ideal and practical Op-amp, internal circuits, Op-amp characteristics, DC and AC characteristics, features of 741 op-amp, modes of operation : inverting, non-inverting and differential.

UNIT II - OP-AMP Applications

Basic application of Op-amp, V to I and I to V converters, sample & hold circuits, multipliers and dividers, Differentiators and Integrators, Comparators, Schmitt trigger, Multivibrators.

UNIT III -Active FilterS & Oscillators

Introduction, 1st order LPF, HPF filters. Band pass, Band reject and all pass filters.

Oscillators: Types and principle of operation – RC& Wien, waveform generators – triangular, saw- tooth, square wave.

UNIT IV-D/A and A/D Converters

Introduction, basic DAC techniques, weighted resistor DAC, R-2R ladder DAC, inverted R-2R DAC, Different types of ADCs - parallel comparator type ADC, counter type ADC, successive approximation ADC and dual slope ADC. DAC and ADC specifications. Data Acquisition: Instrumentation Amplifier.

UNIT V -Timers & Phase Locked Loops

Introduction to 555 timer, functional diagram, monostable and astable operations and applications, Schmitt Trigger. PLL - introduction, block schematic, principles and description of individual blocks of 565.

EC336 MICROPROCESSORS AND INTERFACING

***Course Description & Objectives**:*

As part of this course, students learn about the *History of Microprocessors. Difference between microprocessors, micro controllers. To study the architecture and addressing modes of 8086 and to write assembly language programs of 8086. To study the architecture and addressing modes of 8051 and to write assembly language programs of 8051 and various interfacing circuits necessary for various applications.*

Course Outcome

Upon successful completion of this course, students should be able to:

CO1; Understand the architectures of 8086 family of microprocessors and 8051 microcontroller systems.

CO2: Select a microprocessor or microcontroller that is suitable to given application.

CO3: Analyse hardware features of 8086 processor and 8051 microcontrollers.

CO4: Create the memory and I/O interfacing with 8086 and 8051.

UNIT I - Introduction to Microprocessors

Evolution of Microprocessors, 8086 Microprocessor Architecture: Register organization, Instruction queue, and Physical address calculation. Addressing Modes, Pin description of 8086.

UNIT II - Instruction set

Assembly Language Programs: for arithmetic operations, logical operations, CALL-RET operations, Intra and inter segment calls, sorting and string operations. Interrupts of 8086.

UNIT III - Introduction to Microcontroller

Differences between microprocessor and microcontrollers, 8051 Architecture, Internal & External memory organization, Pin diagram, addressing modes, on board RAM, Special Function Register area, Addressing modes of 8051, interrupts of 8051, interfacing external memory to 8051

Unit IV - PROGRAMMING

8051 Instruction set and assembly language programming, Example programs

UNIT V- INTERFACING

Micro processor interfacing: Key board and Display Interfacing, A/D and D/A converter interfacing, traffic light,

Micro controller interfacing**:** 7-seg LED interfacing, Key board interfacing, LCD interfacing, Stepper motor interfacing.

TEXT BOOK:

EC338 COMMUNICATION SYSTEMS-II

Course Description & Objectives:

As part of this course, students will study the basic principles of cellular mobile system, Optical and Satellite Communications and basic principles of Radar systems. To impart knowledge on wave propagation and information theory.

Course Outcomes:

Upon successful completion of this course, students should be able to:

CO1: Understand model of digital communication systems.

CO2: Analyse the performance of digital modulation techniques.

CO3: Familiarize the concepts of information theory and source coding.

CO4: Apply error control coding techniques for efficient communication.

Unit I - Information Theory

*Concept of amoun*t of information and its properties. Average information, Entropy and its properties. Information rate, Basics of Channel, Concept of Mutual information and its properties, Shannon's theorem, channel capacity, capacity of a Gaussian channel, bandwidth –S/N trade off.

Unit II - Radio Wave Propagation

Ground wave Propagation, Space wave Propagation, Effect of curvature of an Ideal Earth, Variations of Field strength with height in space-wave Propagation, Radio-Horizon, Duct Propagation, Ionosphere Propagation, Gyro frequency, Critical Frequency, Skip Distance, Maximum Usable Frequency.

UNIT III - Introduction to Radar Engineering

Applications of Radars, Block Diagram of Simple Radar , Radar range equation,, Block diagram of Pulse Radar, Pulse Doppler Radar, Doppler Effect, CW Radar, FMCW Radar, MTI Radar

UNIT IV - Introduction to Satellite Communications

Satellite orbit, Keppler's Laws, look Angles, Geo stationary satellite, Satellite communication systems, Satellite subsystems, Satellite earth station, GEO, MEO, LEO, Applications of satellites.

UNIT V - Introduction to Optical Communications

Advantages of fiber optic system, Fiber optic communication system, spectrum of light, Characteristics and behavior of light, How light travels in a cable, snells law, fiber optic cables, fiber materials, Mechanical properties of fiber, optical fiber configuration,.

EC461 SENSORS AND TRANSDUCERS

Course Description & Objectives:

As part of this course, students *understand the basic working principles of different sensors and understand the basic working principles of* transducers. To explain the operation of oscilloscopes and the basic circuit blocks in the design of an oscilloscope and to introduc*e the operation of various electronic Instruments which are used to measure the basic parameters.*

Course Outcome

Upon successful completion of this course, students should be able to:

CO1: Identify various sensors and their brief performance specifications.

CO2: Choose suitable sensor for a given physical variable and understand its principle characteristics.

CO3: Realise the different measurement systems.

CO4: Understand the working principles of Various transducers

UNIT I - Sensor - I

Basic sensor technology, sensor systems, Characteristics, conditioning bridge circuits, amplifiers for signal conditioning, different ADCs. Temperature sensors: RTD, thermister, thermocouple, basic principles, resistance temperature, characteristics, material required, application comparison, Position sensor. Displacement: capacitive sensors, potentiometer sensors. Speed: Hall Effect sensors.

UNIT II - Sensor – II

IR sensors for distant measurement: basic principle and applications. Accelerometer: characteristic, shock, vibration, pressure sensors, Flow, level, force, weight, sensors. Bio sensors, humidity, optical and thermal infrared detectors.

Unit III- Electronic instrumentation

Instrumentation and measurement systems, measurement system performance, static calibration, errors in measurement, true value, accuracy and precision, linearity, hysteresis, Errors in ammeters and voltmeters, permanent magnet moving coil, ohmmeters, measurement of self inductance, Schering bridge, measurement of frequency, sources of errors in bride circuits,

Unit IV - Electronic Measurements

CRO: Electro static deflection, post deflection acceleration of electron beam, observation of wave forms on CRO, measurements of voltages and currents, multi input oscilloscopes, Negative resistance oscillators, square wave and pulse generators, Function generator, Q meter.

UNIT V - Transducers

Classification of Transducers, stain gauges, photoelectric transducers, capacitive, inductive transducers, LVDT Thermoelectric transducers, load cell, light and proximity sensors, data acquisition systems.

MS203 PRINCIPLES OF MANAGEMENT & ORGANIZATIONAL BEHAVIOUR

Course Description and Objective:

Objective of the course is to give basic perspectives of Management theories and practice. This will form foundation for further study of functional areas of management and give a conceptual framework for understanding.

Course Outcomes:

By the end of this course it is expected that the student will be able to:

1. Understand management thought and its evolution
2. Importance of planning and its process in the organizations
3. Process of organizing and types of organizational structures
4. Directing and control process in the organizations
5. Nature and scope of organizational behaviour

UNIT – I **- 14 Hrs**

Introduction to Management: Concept of management –- nature of management – importance of management – functions of management – evolution of management thought - scientific management – Modern management – human relations theories – management Vs administration.

UNIT – II **- 12 Hrs**

Planning: Importance – advantages – disadvantages – types of plans – process of planning – steps involved in planning, Techniques of planning - Decision – Decision Making – Process.

UNIT – III **- 10 Hrs**

Organizing: Principles of organization – types of organization structures, merits, demerits and suitability –Departmentation, Centralization and decentralization

UNIT – IV **- 14 Hrs**

Directing and Controlling: Meaning and Nature of Directing – leadership, Communications - formal and informal communication.
Controlling: Importance – Process and Techniques of controlling.

UNIT – V **- 10 Hrs**

Organizational Behaviour: Organizational Behaviour – Meaning – Nature and Scope of Organizational Behaviour – Contributions of different disciplines of OB – Context of OB – Organizational and Environmental context.

MS212 BUSINESS ENVIRONMENT AND ETHICS

Course Description and Objective:

To inculcate knowledge and awareness of Indian environment of business and it's impact on d business decision making and imbibe the ethical values in the minds of young entrepreneurs.

Course Outcomes:

By the end of this course it is expected that the student will be able to:

1. Understand components of business environment and their impact on business performance
2. Issues of socio - political environment and their influence on business
3. Challenges of Techno, economic and legal environmental factors on business efficiency
4. Importance of ethical environment in conducting business
5. Ethical implications and corporate social responsibility

UNIT – I **- 12 Hrs**

Business Environment: Introduction, Importance of Business Environment – External and Internal Environment – External Environment, Demographic, Social, Cultural, Political, Economic, Legal, Internal Environment of Business.

UNIT – II **- 12 Hrs**

Socio – Political Environment: Demographic Environment, undertaking demographic, Demographic classification, Social Environment, Undertaking Society, Social Class and Social Status, Social Stratification, understanding family, political environment, impact of political environment on business.

UNIT – III **- 12 Hrs**

Techno – Economic – legal environment: A brief review of industrial policies, since independence – Monetary policy – Balance of payments – Money and Capital Markets, Technological Environment–understanding technology and technology science.

UNIT – IV **- 12 Hrs**

Business Ethics: Ethics Analysis based on understanding of perceptual differences, Ethics and corporate social responsibility, Social responsibility.

UNIT – V **- 12 Hrs**

BUSINESS ETHICS AND CSR: Ethical implication technology, ethics in natural and global environment – corporate environmental responsibility.

TEXT BOOKS:

1. K.Aswathappa, “Essentials of Business Environment”, 5th ed., Himalaya 2007.

MS303 MARKETING AND HR MANAGEMENT

Course Description and Objective :

The objective of the course is to provide basic knowledge of functional areas of Management i.e., Marketing and Human Resource Management and their importance in achieving organizational goals.

Course Outcomes:

By the end of this course it is expected that the student will be able to:

1. Understand concepts of marketing and Indian marketing environment
2. Importance of segmentation, targeting and positioning in marketing planning
3. Importance of Marketing mix elements in attracting customers to buy
4. Nature, scope, importance and functions of HRM
5. Job analysis, performance evaluation, wage and salary administration

UNIT – I **- 12 Hrs**

Introduction to Marketing: Needs, Wants, Demands, Products, Exchange, Transactions, Market, Marketing, Production Concept, Product Concept, Sales Concept, Marketing Concept, Societal Marketing Concept, Marketing Environment, Indian Marketing Environment.

UNIT – II **- 12 Hrs**

Market Segmentation: Identification of Market Segments – Consumer and Institutional / Corporate Clientele – Segmenting Consumer Markets, Segmentation Basis, Selecting Target Markets, Segmentation and Targeting as a Basis for Strategy Formulation, Developing and Communicating a Positioning Strategy.

UNIT – III **- 12 Hrs**

Marketing Mix Elements:

A. Product Management: Product Life Cycle, Product Line, Product Mix, Product-line decisions, Brand decisions, classification of new products, New Product Development

B. Pricing Strategy: Objectives of Pricing, Methods of Pricing.

C. Sales And distribution Management:

D. Marketing Communication: The communication process, Communication mix, Managing advertising, sales promotion, Public relations and Direct Marketing.

UNIT – IV **- 12 Hrs**

Human Resource Management: Introduction: Definition, Nature – Scope – Objective – Importance – Functions of HRM – Challenges of HRM, Human Resource Planning Process – Corporate social responsibility.

UNIT – V **- 12 Hrs**

Human Resource Development Process: Basic prerequisites – Job Analysis, Job Description – Job Specification and evaluation – Job Design – Training Methods – Performance Appraisal – Objectives – Methods – Wage and Salary Administration.

TEXT BOOKS:

1. Rajan Saxena, "Marketing Management", 2nd ed., TMH, 2006.
2. V.S.Ramaswamy , S.Namakumari, "Marketing Management", 3rd ed., Macmillan, 2003.

MS310 ENTREPRENEURSHIP AND PROJECT MANAGEMENT

Course Description and Objective:

To provide the knowledge of essentials of entrepreneurship and government role in promoting entrepreneurship. The course also covers basics of project management and Networking techniques.

Course Outcomes:

By the end of this course it is expected that the student will be able to:

1. Understand essentials of entrepreneurship and factors effecting entrepreneurship
2. Entrepreneurial motivation, steps involved in preparing a business plan
3. Government role in promoting entrepreneurship
4. Causes of sickness and measures to revival
5. Essentials of project management and project management techniques

UNIT – I **- 12 Hrs**

Introduction to Entrepreneurship: Definition of entrepreneurship, characteristics of entrepreneurship, evolution of the term entrepreneur, traits of an entrepreneur, functions of an entrepreneur and enterprise, stages in entrepreneurial process, barriers to entrepreneurship, environmental factors affecting entrepreneurship.

UNIT – II **- 12 Hrs**

Entrepreneurial motivation: the motivating factors, entrepreneurial ambitions, compelling factors, facilitating factors, the achievement motivation, business plan and steps involved in business plan.

UNIT – III **- 12 Hrs**

Governmental role in promoting entrepreneurship: role of DIC, SIDO, SISI, NSIC, SIDBI, NISIET, PMEGP, commercial banks, subsidies and incentives offered by the government.

UNIT – IV **- 12 Hrs**

Sickness and measures to revival sickness: sickness causes – marketing, finance, production, human resources, poor management, competition, lack of infrastructure management.

Understanding the causes for sickness, role of the government in reviving the sick units.

UNIT – V **- 12 Hrs**

Project evaluation, auditing and monitoring: project feasibility study, techniques of project evaluation, and steps in project auditing, project monitoring and its procedure, project management techniques-CPM, PERT, GANTT CHART, and project CRASHING.

Text Books:

1. H. Nandan, "Fundamentals of Entrepreneurship", 5th ed., PHI, New Delhi, 2007.

MS409 PRODUCTION AND OPERATIONS MANAGEMENT

Course Description and Objectives:

The objective of the course is to enable students to learn the basics of Operations and Production which will help them in understanding actual business process. Important concepts of TQM, Six Sigma and ISO series are also covered in the course.

Course Outcomes:

By the end of this course it is expected that the student will be able to:

1. Understand production and production systems and value engineering
2. Factors effecting plant location and essentials of materials management
3. Concepts of work study, method study and reliability
4. Importance of quality control and concepts of TQM, Six Sigma and ISO series
5. Recent developments in production and operations management

UNIT – I

Production: Systems concept of Production, characteristics of modern production operations management, recent trends in production and operations management.
Types of Production Systems: Flow, Job-shop and Batch manufacturing.

Productivity: Basic concepts, measurement of productivity – total productivity, factor productivity, methods for improvement of productivity.
Product design, new product development and value engineering.

UNIT – II

Plant location and layout: Factors affecting plant location and layout, types of plant layouts – process, product and fixed position layout.

Material management: inventory control, purchase function, ABC analysis, Economic Order Quantity (EOQ) and just in time concept.

UNIT - III

Work study – Method study, Time study, Standard time calculations, work sampling.

Plant Maintenance – preventive, breakdown, total productive maintenance.

Reliability – concept of reliability, reliability improvement and calculations.

UNIT - IV

Quality control – quality, quality control, quality control vs inspection and statistical quality control. Control charts for variables and attributes. Six sigma, ISO series, TQM & Demings contribution to quality.

UNIT - V

Modern production & international operations management : Just-in-time manufacturing, kaizen, Business process reengineering, supply chain management, lean manufacturing.

Nature of international operations management: Strategic issues, outsourcing, managing service operations, international quality standards, TQM, internationalization of R & D.

TEXT BOOKS:

CS223 OBJECT ORIENTED PROGRAMMING THROUGH JAVA

Course description and Objectives:

On Completion of this course, the student will be able to understand fundamentals of object- oriented programming in Java, including defining classes, invoking methods, using class libraries. Have the ability to write a computer program to solve specified problems. Be able to use the Java SDK environment to create, debug and run simple Java programs.

Course Outcomes:

The student is expected to have

- *Understanding of OOP concepts and basics of java programming (Console and GUI based)*
- *The skills to apply OOP and Java programming in problem solving*
- *Should have the ability to extend his knowledge of Java programming further on his/her own.*

UNIT I - Introduction, Classes and Objects

Creation of Java, Importance of Java to Internet, Byte code, Java buzzwords, OOP Principles- Encapsulation, Inheritance and Polymorphism, Data types, Variables, Declaring variables, Dynamic initialization, Scope and life time of variables, Arrays, Operators, Control statements, Type conversion and casting, Compiling and running of simple Java program, Concepts of classes and objects Class fundamentals – Declaring objects, Assigning object reference variables, Introducing methods, Constructors, Usage of static with data and methods, Usage of final with data, Access control, this key word, Garbage collection, Overloading methods and constructors, Call by value, Recursion, Nested classes and Inner classes, Exploring the String class.

UNIT II - Inheritance, Packages and Interfaces

Basic concepts, Member access rules, Usage of super key word, Forms of inheritance, Method overriding, Abstract classes, Dynamic method dispatch, Using final with inheritance, the Object class. Defining, Creating and Accessing a Package, Understanding CLASSPATH, Importing packages, Differences between classes and interfaces, Defining an interface, Implementing interface, Applying interfaces, Variables in interface and Extending interfaces.

UNIT III - Exception Handling, Multithreading

Concepts of Exception handling, Types of exceptions, Usage of try, Catch, Throw, Throws and Finally keywords, Built-in exceptions, Creating own exception Sub classes, Concepts of Multithreading, Differences between process and thread, Thread life cycle, Creating multiple threads using Thread class, Runnable interface, Synchronization, Thread priorities, Inter thread communication, Daemon threads, deadlocks, Thread groups.

UNIT IV - Applets & Event Handling & AWT Controls

Applet Class, Applet Architecture, Applet Skeleton - Applet Initialization and Termination, Overriding update(), Simple Applet, Display Methods, Requesting Repainting - A simple banner Applet, Using The Status Window, The HTML APPLET Tag, Passing parameters to Applets, Applet Context and show Document.

Event sources, Event classes – ActionEvent, AdjustmentEvent, ComponentEvent, Container Event, Focus Event, InputEvent, ItemEvent, KeyEvent and MouseEvent, Delegation event model, Event Listeners, Handling mouse and Keyboard events, Adapter classes.

UNIT V - AWT & Swing

Concepts of components, Container, Panel, Window, Frame, Canvas, Font class, Color class and Graphics. AWT Controls : Buttons, Labels, Text fields, Text area, Check boxes, Check box groups, Lists, Choice, Scrollbars, Menus, Layout Managers - Flow, Border, Grid, Card and Grid bag.

JApplet, JFrame and JComponent, Icons and Labels, Handling threading issues, Text fields, Buttons – The JButton class, Check boxes, Radio buttons, Combo boxes, Tabbed Panes, Scroll Panes, Trees, and Tables.

IT201 INTERNET AND WEB TECHNOLOGIES

Course Description & Objectives:

This course is intended to teach the basics involved in publishing content on the World Wide Web. This includes the 'language of the Web' – HTML, the fundamentals of how the Internet and the Web function, a basic understanding of graphic production with a specific stress on creating graphics for the Web, and a general grounding introduction to more advanced topics such as programming and scripting. This will also expose students to the basic tools and applications used in Web publishing.

Course Outcomes:

- *Analyze a web page and identify its elements and attributes.*
- *Create web pages using XHTML and Cascading Style Sheets.*
- *Build dynamic web pages using JavaScript (Client side programming).*
- *Create XML documents and Schemas.*
- *Build interactive web applications using AJAX.*

UNIT I - Networking Concepts

Introduction, Protocols in Computer Communications, the OSI Model, OSI Layer Functions.

Introduction, Why Internet Working?, Problems in Internet Working, Dealing with Incompatibility Issues, A Virtual Network, Internet Working Devices, Repeaters, Bridges, Routers, Gateways, A Brief History of the Internet, Growth of the Internet.

UNIT II - Network Protocols

Introduction, Brief History of WWW, the Basics of WWW and Browsing, Hyper Text Markup Language, Common Gateway Interface, Remote Login.

UNIT III -JavaScript and AJAX

Introduction, JavaScript, Basic Concepts, Controlling JavaScript Execution, Miscellaneous Features, JavaScript and Form Processing, Pop-up Boxes. AJAX:Introduction, How AJAX Works?, Life without AJAX, AJAX Coding, Life with AJAX.

UNIT IV -Introduction to XML

What is XML?, XML versus HTML, Electronic Data Interchange, XML Terminology, Introduction to DTD,Document-Type Declaration,Element-Type Declaration,Attribute Declaration,Limitations of DTDs, Introduction to Schema, Complex Types, Extensible Stylesheet Language Transformations, Basics of Parsing, JAXP

UNIT V - Creating Good Web Pages

Introduction, Top Level Navigation, Creating Sample Layouts, Metaphor, Theme, and Storyboard, Screen Resolution,3-Column Layout, Using Frameworks, Using Graphics, Usability for the Handheld Devices, Creating Multilingual Web sites, XHTML and Web Browser Compatibility Issues, Designing the Basic Elements of a Home Page.

TEXT BOOK:

CS315 OPERATING SYSTEMS

Course Description & Objective:

In this course students should understand how the operating system effectively manages system resources.

Course Outcomes:

- *To understand the types of Operating systems and analyze the process scheduling Algorithms and Case study on processing Scheduling.*
- *To understand the resource sharing among the processes in the system.*
- *To understand how to manage the memory during the process execution (Memory Management) and File Management system.*

UNIT I - Introduction

What Operating System do, Operating System structure. Process Concept: Overview, Process scheduling, Operations on process, Inter process communication. Process Scheduling: Scheduling Criteria, Scheduling Algorithms, Multiple-Processor Scheduling, Case Study: Process scheduling in Linux.

UNIT II - Process Synchronization

The Critical-Section Problem, Peterson's Solution, Synchronization Hardware, Semaphores, Monitors, Classical problems of synchronization, Case Study : Process Synchronization in Linux.

.

UNIT III - Deadlocks

Deadlock Characterization, Methods of Handling Deadlocks, Deadlock prevention, Deadlock avoidance, Deadlock Detection and Recovery.

UNIT IV - Memory Management

Continuous memory allocation, paging, structure of the page table, segmentation, demand paging, page replacement algorithms.

UNIT V - File System

File Concept, Access Methods, Directory Structure, File System Mounting, File Sharing, Protection, File-System Structure, File System Implementation, Directory Implementation, Allocation Methods, Free Space Management.

Secondary-Storage Structure: Overview of Mass-Storage Structure, Disk Structure, Disk Scheduling, RAID Structure.

TEXT BOOK:

IT311 UNIX AND SHELL PROGRAMMING

Course Description & Objectives :

Effectively use Unix and C to write, test, debug, and maintain modest-sized programs, design, build, and use software tools that fit well into Unix, writing such tools both in the Bourne Shell and in C, using Unix arguments and standard input and output facilities, design modest-sized program using independent modules (abstract data types), that offer some potential for reuse, clearly explain the principles behind Unix concepts such as the file system structure, pipelines, file permissions, and environments use standard C libraries (including the standard C library, stdio, and ctype) and their associated header files effectively in writing programs.

Course Outcomes:

- *Students will have learned to use the Unix system as programmers and developers.*
- *Students will learn Unix structure, commands, and utilities.*
- *Students will become versed with regular expressions and shell programming.*

UNIT I - Introduction to Unix

Introduction to UNIX, Unix structure, Unix Features, Common commands - Date, Time,

Calender, Who, Password, Echo and Man, Basic Vi editor - Modes, Commands Related to Modes, Inserting, Deleting Text and Moving Cursor, FileSystems, FileNames, FileTypes, Directories, File Permissions, Commands to be covered here are : cp, mv, ln, rm, unlink, mkdir, rmdir, du, df, mount, umount, find, umask, ulimit, ps, who, finger, arp, ftp, telnet and rlogin, process utilities, Disk & network utilities.

UNIT II - Unix Utilities

What is a shell, Shell relationships,Standard streams,Redirection, Pipes, Tee command, Command Substitution, Shell variables, Conditions, History and control structures and Shell programming. Filters, Text processing utilities and backup utilities, Detailed commands to be covered are: cat, tail, head, sort, nl, uniq, grep, egrep, fgrep, cut, paste, join, tee, more, pg, comm, cmp, diff, tr, awk and tar.

UNIT III- File I/O & File Directories

File descriptor, open function, close function, Create function,lseek, read,write, Filesharing, dup and dup2 functions, fcntl, ioctl functions. File status, Stat, fstat, lstat Functions, File types, Permission, Ownership of new files and Directories, File system, Links, File times, Directory related functions, The System calls to be covered are : access,umask, chmod, fchmod, chown, link, unlink, symlink, mkdir, rmdir, chdir, fchdir, getcwd and utime.

UNIT IV- Environment of Unix Process & Process control

Process identifiers, fork, vfork, exit, wait, waitpid, wait3, exec Functions, Race conditions, Zombie process. Signal Concepts, Signal handling, Important signals: kill, raise, alarm, pause, and abort.

UNIT V -Inter Process Communication

Pipes, FIFO, System V IPC – Message Queue, Semaphore and Shared Memory.

TEXT BOOKS :

CS222 DATABASE SYSTEMS

Course description and Objectives:

The objective of the course is to present an introduction to database management systems, with an emphasis on how to organize, maintain and retrieve - efficiently, and effectively - information from a DBMS. The course will focus on 5 main areas such as Information gathering, Data analysis, Database design, Concurrency and robustness, Efficiency and scalability.

Course Outcomes:

Upon successful completion of this course, students should be able to:

- *Describe the fundamental elements of relational database management systems*
- *Explain the basic concepts of relational data model, entity-relationship model, relational database design, relational algebra and SQL.*
- *Design ER-models to represent simple database application scenarios*
- *Convert the ER-model to relational tables, populate relational database and formulate SQL queries on data.*
- *Improve the database design by normalization.*

UNIT I - Database System- concepts and architecture

Data modelling using the Entity Relationship (ER) modelling and Enhanced Entity Relationship (EER) modelling, Specialization and Generalization.

UNIT II - The Relational Model

Relational database design using ER to relational mapping, Relational algebra and relational calculus, Tuple Relational Calculus, Domain Relational Calculus, SQL.

UNIT III - Database design theory and methodology

Functional dependencies and normalization of relations, Normal Forms, Properties of relational decomposition, Algorithms for relational database schema design.

UNIT IV - Transaction processing concepts

Schedules and serializability, Concurrency control, Two Phase Locking Techniques, Optimistic Concurrency Control, Database recovery concepts and techniques.

UNIT V - Data Storage and indexing

Single level and multi level indexing, Dynamic Multi level indexing using B Trees and B+ Trees, Query processing and Query Optimization, Introduction to database security.

TEXT BOOKS:

1. Ramez Elmasri and Shamkant B. Navathe, Fundamentals of Database Systems (5/e), Pearson Education, 2008.

Minor-C Information Technology	L	T	P	To	C
	4	0	-	4	4

CS434 MULTIMEDIA SYSTEMS

Course Description and Objectives:

Understand the characteristics of multimedia systems and how to address issues Be aware of the differences among multimedia authoring systems. Be familiar with the software development process as practiced in a multimedia development environment Be able to design, write, document, debug and evaluate a non trivial multimedia system. Appreciate and understand the legal and ethical issues associated with developing multimedia systems, particularly in regard to use of media clips developed by others.

Course Outcomes:

- *Write action script for a particular problem.*
- *Design and Draw customized GUI components.*
- *Apply Transformations on Components.*
- *To make use of fundamental concepts and formulate best practices*

UNIT I

Introduction to Multimedia, Media and Data Streams, Sound/Audio, Images and Graphics, Video and Animation.

UNIT II

Data Compression, Optical Storage Media; Computer Technology, Multimedia Operating Systems.

UNIT III

Networking Systems, Multimedia Communication Systems; Database Systems.

UNIT IV

Multimedia Architecture; Multimedia Documents, Hypertext and MHEG.

UNIT V

User Interfaces, Synchronization, Abstractions for Programming; Multimedia Application Development; Virtual Reality; Future Directions.

TEXT BOOKS:

1. Ralf Steinmetz, Klara Nahrstedt "Multimedia: Computing Communications & Applications" Pearson Education (2004)
2. Parekh Ranjan "Principles of Multimedia" Tata McGraw-Hill (2007)

REFERENCE BOOKS:

CS225 SOFTWARE ENGINEERING

Course Description and Objectives:

This course will be helpful for the student to understand the concept of a software life cycle, the role of process models and how to produce a set of software requirements. This course introduces the concepts and methods required for the construction of large software intensive systems. It aims to develop a broad understanding of the discipline of software engineering.

Course Outcomes:

After completing the course students will be able to:

- *Plan a software engineering process to account for quality issues and non-functional requirements;*
- *Employ a selection of concepts and techniques to complete a small-scale analysis and design project.*
- *Interact with a client to elicit input, and communicate progress.*
- *Employ group working skills - including general organization, planning and time management, and inter-group negotiation, etc.*
- *Translate a specification into a design, and then realize that design practically, all using an appropriate software engineering methodology.*

UNIT I - Introduction to Software Engineering

The evolving role of software, Changing Nature of Software, Software myths. Software engineering- A layered technology, a process framework, The Capability Maturity Model Integration (CMMI), Process patterns, process assessment, personal and team process models. The waterfall model, Incremental process models, Evolutionary process models, The Unified process.

UNIT II - Requirements Engineering & Analysis Modeling

Requirements engineering Tasks: Inception, elicitation, elaboration, negotiation, specification, validation, requirements management.

Initiation of requirements engineering process: Identify stakeholders recognizing multiple view points, working towards collaborator, asking the first question. Building the analysis model: data modeling-data objects, attributes, relationship, cardinality and modularity. Class based modeling: identify analysis classes, specify attributes, and define operations, CRC model, association and dependency, analysis package**.**

UNIT III - Software Design

Design Engineering: Design process and Design quality, Design concepts, the design model, Data flow diagrams, process specification.
Creating an architectural design: Software architecture, Data design, Architectural styles and patterns, Architectural Design.
Performing User interface design: Golden rules, User interface analysis and design, interface analysis, interface design steps, Design evaluation.

UNIT IV - Process & Product Metrics and Software Testing

Product metrics: Software Quality, Metrics for Analysis Model, Metrics for Design Model, Metrics for source code, Metrics for testing, Metrics for maintenance. Metrics for Process and Products: Software Measurement, Metrics for software quality.
Testing Strategies: A strategic approach to software testing, test strategies for conventional software, Black-Box and White-Box testing, Validation testing, System testing, the art of Debugging.

UNIT V - Risk & Quality Management

Risk management: Reactive vs. Proactive Risk strategies, software risks, Risk identification, Risk projection, Risk refinement, RMMM, RMMM Plan.
Quality Management: Quality concepts, Software quality assurance, Software Reviews, Formal technical reviews, Statistical Software quality Assurance, Software reliability, The ISO 9000 quality standards.

CS425 DATAWAREHOUSING & DATAMINING

Course Description and Objectives:

This course is about knowing of how to make use of historical data so that high end business decision can be taken for the growth of an organization. The main objective of this course is to designing the intelligent machines which can take risk business decisions behalf of humans using the datamining techniques like classification, clustering, outlier detection, association rule mining.

Course Outcomes:

Students are able to

- *Learn the basic concepts of Database Technology Evaluation steps and also understood the need of data mining and its functionalities*
- *Explore the efficient and effective maintenance of Data Warehouses.*
- *Apply the data mining functionalities like Clustering, Classification, Association Analysis to real world data.*
- *Discover interesting patterns and association rules from huge volume of data used to do classifications and predictions.*
- *Gain knowledge on developing areas like Web Mining, Text Mining, and Spatial Mining.*

UNIT I - Introduction & Data Warehousing

Why Data Mining, What is Data Mining, Kinds of Data, Kinds of Patterns, and Technologies used, Kinds of applications adopted, Major issues in Data Mining.

Basic Concepts, Data Warehouse Modeling, Data Warehouse Design and Usage, Data Warehouse Implementation, Data Generalization by Attribute-Oriented Induction

UNIT II - Data Preprocessing

Data Objects and Attribute Types, Basic Statistical Descriptions of Data, Data Visualization, Measuring Data Similarity and Dissimilarity. An Overview, Data Cleaning, Data Integration, Data Reduction, Data Transformation and Data Discretization

UNIT III - Data Cube Technology

Preliminary Concepts, Data Cube Computation Methods, Processing Advanced Kinds of Queries by Exploring Cube Technology, Multidimensional Data Analysis in Cube Space

Basic Concepts and Methods: Basic Concepts, Frequent Itemset Mining Methods, Which Patterns Are Interesting?—Pattern Evaluation Methods

Pattern Mining in Multilevel, Multidimensional Space, Constraint-Based Frequent Pattern Mining

UNIT IV - Classification & Advanced Classification

Basic Concepts, Decision Tree Induction, Bayes Classification Methods, Rule-Based Classification, Model Evaluation and Selection, Techniques to Improve Classification Accuracy

Bayesian Belief Networks, Classification by Back propagation, Support Vector Machines, Classification Using Frequent Patterns, Lazy Learners, Other Classification Methods

UNIT V - Cluster Analysis & Advanced Cluster Analysis

Cluster Analysis, Partitioning Methods, Hierarchical Methods, Density-Based Methods, Grid-Based Methods, Evaluation of Clustering

Probabilistic Model-Based Clustering, Clustering High-Dimensional Data

TEXT BOOKS:

CS435 SOFTWARE TESTING METHODOLOGIES

Course Description and Objectives:

Software testing is a subject where the student will learn and apply basic skills needed to create and automate the test plan of a software project.It aims to describe principles and strategies for generating system test cases and to understand the essential characteristics of tools used for test automation.

Course Outcomes:

Students who have completed this course would have learned

- *Various test processes and continuous quality improvement*
- *Types of errors and fault models*
- *Methods of test generation from requirements*
- *Behavior modeling using UML: Finite state machines (FSM)*
- *Test adequacy assessment using: control flow, data flow, and program mutations*

UNIT I - Introduction

Purpose of testing, Dichotomies, model for testing, consequences of bugs, taxonomy of bugs Flow graphs and Path testing: Basics concepts of path testing, predicates, path predicates and achievable paths, path sensitizing, path instrumentation, application of path testing.

UNIT II - Transaction Flow Testing & Domain Testing

Transaction flows, transaction flow testing techniques. Dataflow testing:- Basics of dataflow testing, strategies in dataflow testing, application of dataflow testing.

Domains and paths, Nice & ugly domains, domain testing, domains and interfaces testing, domain and interface testing, domains and testability.

UNIT III - Paths, Path products and Regular expressions

Path products & path expression, reduction procedure, applications, regular expressions & flow anomaly detection.

UNIT IV - Logic Based Testing & State, State Graphs and Transition testing
Overview, decision tables, path expressions, kv charts, specifications.
State graphs, good & bad state graphs, state testing, Testability tips.

UNIT V - Graph Matrices and Application
Motivational overview, matrix of graph, relations, power of a matrix, node reduction algorithm, building tools. Usage of JMeter and Winrunner tools for functional / Regression testing (Ref Text book2).

CS322 OBJECT ORIENTED ANALYSIS & DESIGN

Course Description and Objectives:

This course explains how a software design may be represented as a set of interacting objects that manage their own state and operations. It describes the activities in the object - oriented design process and introduces various models that can be used to describe an object-oriented design.

Course Outcomes:

- *To understand the fundamental principles of Object Oriented programming.*
- *To master key principles in Object Oriented analysis, design, and development.*
- *Be familiar with the application of the Unified Modelling Language (UML) towards analysis and design.*

- *To know common patterns in Object Oriented design and implement them.*
- *To be familiar with alternative development processes.*

UNIT I - Introduction to UML

Importance of Modeling, Principles of Modeling, Object Oriented Modeling, Conceptual model of the UML, Architecture, Software Development Life Cycle.

UNIT II - Basic Structural Modeling & Basic Behavioral Modeling

Classes, Relationships, Common Mechanisms, and Diagrams. Use cases, Use case Diagrams, Interactions, Interaction Diagrams, Activity Diagrams.

UNIT III - Class & Object Diagrams

Terms, Concepts, Modeling Techniques for Class & Object Diagrams.

UNIT IV - Advanced Structural Modeling & Advanced Behavioral Modeling

Advanced Classes, Advanced Relationships, Interfaces, Types and Roles, Packages.

Events and Signals, State Machines, Processes and Threads, Time and Space, State Chart Diagrams.

UNIT V - Architectural Modeling

Component, Deployment, Component Diagrams and Deployment Diagrams.

Paper – I (II Year) : HS219: INDIAN HISTORY AND CULTURE

Course Description &objectives:

This course introduces basic understanding of Indian culture and history. The course objective is to describe the various stages of the Indian history and their importance, understand the importance of different historical events in shaping the Indian history and to enable the students understand the relevance of Indian history and make them much more socio-conscious in the society.

Course Outcomes:

1. To acquaint the students with the Indian history and culture.
2. To prepare the students for the civil services examinations [as Indian history is very important both at the prelims and mains level].
3. To make the students more inclined knowing Indian history not only from the examination point of view but to feel proud of our rich cultural heritage [literature , music , sculpture , art , architecture].
4. To make the students balanced individuals, responsible in protecting and glorifying our history.

Unit- I Ancient Indian History

Prehistoric Background of Indian culture.
Harappan culture – Cities – Society – economy and trade - End of the Harappan cities.
Society and Economy of the early Vedic and later Vedic periods
Emergence and Spread of Puranic thesim, Buddhism and Jainism.
Mauryans, Post Mauryans and Sangam Period
The age of Satavahanas and the Guptas
The Pallavas, the Chalukyas and the Cholas

Unit –II Medieval Indian History

General Conditions under the Delhi Sultanate.
General Conditions under the rulers of the Vijayanagara Empire.
General Conditions under the rule of the Mughals
Shivaji and the rise of the Marathas.
Bhakti Movement

General Conditions under the rule of the Mughals

Shivaji and the rise of the Marathas.

Bhakti Movement

Unit – III Indian Culture

Salient aspects of Art forms – Music and Dance
Language and Literature
Architecture and Sculpture
Paintings and places of Cultural interest

Unit –IV British Rule in India

The Beginning of European settlements.
Government and the economic policies of the British empire in India 1757 – 1857.
The First War of Independence of 1857 and the consequent administrative changes.
Religious and Social Reforms after 1858.

Unit – V Struggle for freedom

Economic impact of the British rule
The national Movement 1858-1885; 1885-1905; 1905-1920; 1920-1947
Contribution from various states
India after Independence- Post independence consolidation of states

Paper – II (II Year): HS224: Polity and Governance of India

Course Description &objectives:

This course introduces basic understanding of Indian polity and constitution. The course objective is to make students to understand the functioning of government at the centre and state level besides local self government as outlined in the constitution and gives basic knowledge about the fundamental rights & duties of a citizen besides gives the knowledge about Elections and Democracy at work.

Course Outcomes:

1. Applies the constitution and its principles to the day to day happenings.
2. Inculcates the respect for the constitution and rights of others besides safeguarding one's own rights.
3. Analyzes functioning of executive, legislative and Judiciary.
4. Compares the Indian constitution with other countries

Unit -I : Overview of Indian constitution

Making of Indian constitution

Salient features

Preamble

Significant Provisions; Amendments; Basic structure

Unit – II: working of the Indian Constitution

Features of Indian Federal system

Centre-State relations- Legislative, executive, financial

Issues and concerns – coalition governments ; Administrative Reforms

Unit - III: Structure of the Government

Union Government

State Government

Local Government

Unit – IV: Powers and Functions of Constitutional, Statutory and Non statutory bodies

Constitutional - Election Commission, UPSC, Finance Commission, CAG etc.,

Statutory - NHRC, CVC, etc.,

Non statutory – Planning Commission, National Development Council etc.,

Unit – V: Political Dynamics

Representation of Peoples' Act

Political Parties

Pressure Groups

Elections, Electoral Reforms

Transparency, Accountability and Right to Information

TEXT BOOKS:

1. D.D. Basu—Indian Constitution
2. Subhash C. Kashyap : Our Parliament, Publication Division

References:

1. P.M. Bakshi—Indian Constitution
2. Laxmikanth, Indian Polity

Paper – III (III Year): HS307 Economic and Social Development of India

Course Description &objectives:

This course introduces basic understanding of Indian economy. The course objective is to make students to understand the role of government in managing economy and gives basic knowledge about different sectors of the economy besides equipping them the tools to analyze the state of current economy.

Course Outcomes:

1. Applies the macro economics techniques and its principles to the day to day happenings.

2. Inculcates the respect for the constitution and rights of others besides safeguarding one's own rights.
3. Analyzes functioning of state of economy.
4. Analyzes the impact of external sector on Indian economy

Unit I: Structure of the Economy

Basic Concepts

Sources of Revenue and classification of expenditures of Union Government

Fiscal indicators

Structure of the Economy

Recent trends in the National Income

Performance on the social front

Unit II: LPG Policies

Transition from Centralized Planning to Indicative Planning

LPG Policies

Globalisation and its discontents

WTO, TRIPS, TRIMS, GATS

Unit III: Agrarian Issues

Agrarian Structure, Land Reforms

Farm subsidies, Agricultural Price Policies, Food Security

Agrarian Crisis and Farmer suicides, WTO and Indian Agriculture

Unit IV: Industrial Strategy

Strategy of Industralisation, Special Economic Zones, FDI Policy

Multi-National Companies and their importance

Rise of Corporate power in India

Privatization and Disinvestment policies

Infrastructure policies

Unit V: Poverty Alleviation Programmes

Measures of Poverty and inequality and trends therein

Anti Poverty Programmers -

Public Distribution System

Wage Employment Programmes

Concepts of Social justice and Inclusive growth and their components

Paper – IV (III Year): HS308 Basic Numeracy, Mental Ability and Logical Reasoning

Course Description and Objectives:

Students will be introduced to various Arithmetic and Reasoning Problems.

The students will have acquaintance with various problems like Simple and Compound Interest, Time & distance etc. besides solving puzzles and Non verbal Reasoning.

Course Outcomes:

Upon successful completion of this course, students should able to

1. Student can meet the demands of current job market besides equipping them higher studies like CAT,GMAT etc...
2. Solves Arithmetic and Reasoning Problems within shortest possible time without paper work.
3. Student exhibits better analytical skills and aptitude skills.
4. Student develops interpretational skills.

Unit I: Basic Numeracy and Data Interpretation:

Number systems, Number Series, HCF and LCF of Numbers, Fraction, Simplification, Percentage, Average, Ratio and Proportion, Partnership and Share, mixtures, Chain Rule

Unit II: Basic Numeracy and Data Interpretation:

Time and work, Time and Distance, Profit, Loss and Discount, Simple Interest, Trains, Clocks, Area of Plane Figures, Data Interpretation, Data Sufficiency

Unit IV: General Mental Ability:
Syllogisms, Logical Deductions, Statements and Conclusions, Statements and Assumptions, Statements and Courses of Action and Reasoning,

Unit III: General Mental Ability;
Set theory, Venn and Network Diagrams, Permutations and Combinations, Probability

Unit V: Logical Reasoning:
Verbal reasoning, Logical Reasoning based on Arrangements and Ranking, Team Formations, Quantitative Reasoning, Sequence and Series, Blood Relationships, Direction Test, Puzzle Test.

TEXT BOOKS:

1. Quantitative Aptitude for Competitive Examinations by R. S. Aggarwal (2013)

2. The Pearson Guide to Quantitative Aptitude for Competitive Examinations by Dinesh Khattar (2013)

Paper – V (IV Year): HS403 Geography and Environmental Concerns of India

Course Description and Objectives:
Students will be introduced to various phenomena like El-Nino, Global Warming both at Global and Regional levels and several physiographic phenomena like origin and distribution of Earth quakes, volcanoes tsunamis and resources.

Course Outcomes:

Upon successful completion of this course, students should able to

1. Analyses oceanic and climatic phenomena.
2. The students will analyze the regional issues inconsonance with global happenings.
3. Student will apply general principles of geography and environment and can provide the solutions.
4. Inculcates environment consciousness.

Unit I: Geography

Fundamental concepts of Geography

Physical Geography of India – River systems, climate, soils, minerals, geological Strata, climatic regions, natural vegetation,

Races and Physical Types of People

Unit II: Scientific and Technological Development

Milestones in India's scientific and technological progress in diverse fields – space, Nuclear, IT, Defense, Agriculture and Rural technologies

Prominent scientists of India and their contribution

Recent initiatives to spread scientific temper and S&T practices

Issues relating to Intellectual Property Rights

Unit III: Energy Sources

Sources of Energy-availability and consumption pattern, Energy policy and pricing

Issues relating to hydel power (Big Dams), Thermal Plants and Nuclear power

Green Energy technologies and their importance

Unit IV: Biodiversity

Meaning and importance of Bio-diversity, Sustainable Development Ecosystems and their management

Bio-Diversity of India, Bio- spheres and Biodiversity hot spots of India

Initiatives to preserve bio-diversity

Unit V: Environmental issues.

Magnitude, causes and consequences of environmental pollution in India

Factors that led to global warming and climate change
Recent international protocols to tackle climate change, Carbon trading and its implications,
Concerns of Developing Countries
Disaster Management and Environmental Impact assessment

TEXT BOOKS:

1. Goh Cheng Leong : Certificate Physical and Human Geography
2. Valdiya : Environmental Geology.

REFERENCE BOOKS :

1. NCERT : 6th to 12th Books for Geography
2. NCERT : General geography

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course helps to familiarize various aspects of bioreactors, to understand the media requirements and working conditions for profitable run of bioprocess industries with the help of data analysis.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- *Operate the fermenter*
- *Design the medium for production of metabolites*
- *Understand the modes of fermentation*

SKILLS:

- ✓ Operation of autoclave and fermentation reactor
- ✓ Able to design and optimize the medium
- ✓ Solid-state fermentation
- ✓ Shake-flask fermentation

ACTIVITIES:

- *Preparation fermentation medium*
- *Use of batch and fed batch systems for production of bio-based products*
- *Yield calculations*
- *Software usage for Medium design and optimization*

UNIT - I

Kinetics of Microbial Growth, Sterilisation and Product Formation: Different modes of operation - batch, fed batch and continuous cultivation. Simple unstructured kinetic models for microbial growth-Monod model, Growth of filamentous organisms, Substrate and product inhibition on cell growth and product formation. Different types of industrial sterilization, Thermal death kinetics of microorganisms, Batch and continuous heat sterilization of liquid media, Filter sterilization of liquid media, Air sterilization and design of depth filters.

UNIT - II

Metabolic Stoichiometry and Energetics: Stoichiometry of cell growth and product formation, Elemental balances, degrees of reduction of substrate and biomass, Available electron balances, Yield coefficients of biomass and product formation, Maintenance coefficients energetic analysis of microbial growth and product formation, Oxygen consumption and heat evolution in aerobic cultures.

UNIT - III

Bioreactor Operation: Choosing the cultivation method, design and operation of a typical aseptic, aerobic fermentation process, Environmental requirements for animal cell cultivations, Reactors for large scale production using animal cell, plant cell cultivation, Active and Passive Immobilization of cells, Diffusional limitations in Immobilized cells, Bioreactor considerations in Immobilized cell.

UNIT - IV

Transport Phenomena in Bioprocess System: Gas – Liquid mass transfer in cellular systems, Determination of oxygen rates, Mass transfer for freely rising or falling bodies, Correlations for mass transfer coefficient and interfacial area, Mass transfer across free surface, Other factors affecting K_La, Heat transfer correlations.

UNIT - V

Mixed culture and Solid State Fermentation: Introduction, Major classes of interactions in mixed cultures, simple models describing mixed cultures interactions, Mixed cultures in nature and industrial utilization of mixed cultures, Solid-state fermentation.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

Microbial Culture Studies:

1. Culturing of different types of microorganisms used in the production of commercially important products.
2. Growth of microorganisms.
3. Temperature effect on growth-estimation of energy of activation and Arrhenius Constant for microorganisms.
4. Study of Growth substrate utilization and product formation kinetics in shake – flask cultures.
5. Batch and fed batch cultures

   a) Estimation of Monod parameters

   b) Pure and mixed cultures

   c) Production of secondary metabolites in synthetic and complex industrial media.

Enzyme Kinetics:

6. Extraction of commercially important enzymes, Development of enzyme assays and quantification of enzyme activity and specific activity.

7. Estimation of Michaelis - Menten parameters
8. Effect of pH and temperature on enzyme activity
9. Kinetics of inhibition, Techniques of enzyme immobilization - matrix entrapment, ionic and cross linking.

TEXT BOOKS:

17BT003 ENZYME TECHNOLOGY

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course offers an introduction to enzymes and their functions. The main purpose of this course is to explore various aspects of enzymes such as their classification, mechanism of action, isolation methods and kinetics.

Course Outcomes:

The student will be able to:

- Describe various classes of enzymes, their active sites and energetics of enzyme - substrate complex.
- Gain knowledge on key structural and energetic factors of enzyme stability.
- Summarize current processes involved in industrial enzyme production from plants, animals and microorganisms.
- Understand the different immobilization methods and analyze the bioconversions in immobilized reactors.

SKILLS:

✓ Isolate commercially important enzymes.

✓ Estimate enzyme activity by colorimetric and spectroscopic methods.

✓ Immobilize enzymes for commercial applications.

UNIT –I

INTRODUCTION TO ENZYMES: Discovery of enzymes - a historical recall; Classification of enzymes; Applications of enzymes; Principles of catalysis - collision theory, transition state theory, role of entropy in catalysis; Comparison of chemical and enzyme catalysis; Stability, deactivation and catalytic activities; Mechanisms of enzyme action; Concept of active site and energetics of enzyme substrate complex formation; Specificity of enzyme reaction.

UNIT -II

ISOLATION OF ENZYMES: Extraction and purification of crude enzyme extracts from plant, animal and microbial sources; Methods of characterization of enzymes; Development of enzymatic assays.

UNIT - III

KINETICS OF ENZYME ACTION: Kinetics of single substrate reactions; Estimation of Michaelis - Menten parameters; Importance of Km; Multi-substrate reaction mechanisms and kinetics; Turnover number; Types of Inhibition - kinetic models, substrate and product inhibition; Allosteric regulation of enzymes; Deactivation kinetics.

UNIT - IV

ENZYME IMMOBILIZATION: Physical and chemical techniques for enzyme immobilization - adsorption, matrix entrapment, encapsulation, cross-linking, covalent binding; Advantages and disadvantages of different immobilization techniques; Overview of applications of immobilized enzyme systems.

UNIT - V

IMMOBILIZED ENZYME REACTORS: Design of immobilized enzyme reactors- packed bed, fluidized bed membrane reactors; Bioconversion calculations in free enzyme CSTRs and immobilized enzyme reactors; Stability, deactivation and catalytic activities.

TEXT BOOKS:

1. T. Palmer, “Enzymes”, 1st edition, East West Press, 2004.
2. N.K. Prasad, “Enzyme Technology - Pace Maker of Biotechnology”, 1st edition, PHI publishers, 2011.

REFERENCEBOOK:

1. Devasena, “Enzymology”, 1st edition, PHI, 2011.

ACTIVITIES:

- Isolate amylase/ peroxidase/ urease from various sources.
- Purify the enzyme by different methods.
- Estimate K_M and Vmax of different enzyme reactions.
- Immobilize peroxidase on various substrates cloth, fabric, glass bead and encapsulation.

17BT005 ADVANCED BIOCHEMICAL REACTION ENGINEERING

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course gives immense knowledge on reaction kinetics and searching for reaction mechanism of non elementary reactions. In addition it also provides insights into different types of bio-reactors, their design and operation. The objectives of the course are to impart knowledge of bio-reactor designing and operation for specific conditions and also to compare performances of various bio-reactors.

Course Outcomes:

The student will be able to:

- Develop rate equation for chemical reaction and determine rate kinetics.
- Get knowledge on basic concepts of reactor design.
- Optimization of reactor operation,
- Estimate thermodynamic parameters of reactions.

SKILLS:

- ✓ Searching for reaction mechanism
- ✓ Development of reactor design equation
- ✓ Optimization of reactor operation
- ✓ Determination of reaction thermodynamics

UNIT - I

OVERVIEW OF CHEMICAL REACTION ENGINEERING: Classification of reactions, variables affecting the rate of reaction, Concept of order, molecularity of a reaction, definition of reaction rate, concentration dependent term of rate equation, Temperature dependent term of rate equation, Evaluation of rate constants using Arrhenius equation. Searching for a mechanism

UNIT - II

IDEAL REACTORS: Types of reactions, interpretation of batch reactor data. Introduction to reactor design, general discussion, symbols and relationship between C_A and X_A. Ideal batch reactor, Steady-state mixed flow reactor, Steady-state plug reactors.

UNIT - III

MULTIPLE REACTIONS AND NON ISOTHERMAL REACTIONS: Introduction to multiple reactions, qualitative discussion about product distribution, quantitative treatment of product distribution and of reactor size. Heats of reaction, equilibrium constants from thermodynamics, equilibrium conversion, general graphical design procedure, optimum temperature progression, heat effects, adiabatic operations and non adiabatic operations.

UNIT - IV

CHARACTERIZATION OF REACTORS: Batch bioreactor design, Definition of chemostat, turbidostat, single flow single stage chemostat, single flow multistage chemostat, recycle flow in chemostat, Plug flow behavior, design of plug flow reactor.

UNIT - V

NON-IDEAL REACTORS & HETEROGENEOUS REACTIONS: Concepts of residence time distribution, micro mixing and macro mixing, Reasons for non-ideality, concept of macro using –RTD analysis (E-C-F functions), diagnosing the ills of non-ideal bioreactors.

HETEROGENEOUS REACTIONS: Solid catalyzed reactions, the rate equation for surface kinetics, Pore diffusion, resistance combined with surface kinetics, performance equation for reactors containing porous catalyst particles, product distribution in multiple reactions.

TEXT BOOKS :

1. Octave Levenspiel, “Chemical Reaction Engineering” , 3rd ed. JohnWiely & Sons, 1999.
2. D.G.Rao, “Introduction to Biochemical Engineering”, McGraw-Hill, 2005.
3. P.M.Doran , “Bioprocess Engineering Principles”, Academic Press, 1995.
4. M.L.Shuler and F. kargi , “Bioprocess Engineering”, Prentice Hall of India ,1992.

REFERENCE BOOKS :

1. H.S. Fogler, “Elements of Chemical Reaction Engineering”, 2nd ed. PHI, 1992.
2. J.M.Smith, “Chemical Engineering Kinetics”, 3rd ed. Mc Graw Hill, 1981.

ACTIVITIES:

- Measurement of microbial growth kinetics in fermentor
- Determination product formation kinetics in continuous mode in fermentor
- Measurement of RTD by tracer injection methods

17BT007 R-DNA TECHNOLOGY

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The course is oriented towards understanding the processes of gene expression and regulations. The objective of the course is to provide awareness about different vectors used for gene transfer, enzymes, cloning methods, expression and detection of clones. It is also aimed to provide insights into molecular methods, markers and applications of r-DNA technology.

Course Outcomes:

The student will be able to:

- Gain knowledge on gene expression and regulations.
- Analyze structure and organization of different vectors used in gene transfer.
- Understand and handle enzymes used in gene manipulation.
- Perform cloning methods, expression and detection of clones.
- Excel in molecular techniques, markers and applications of r-DNA technology.

SKILLS:

- ✓ Design and construct vectors.
- ✓ Identify restriction patterns for molecular scissors.
- ✓ Perform stable transformation.
- ✓ Realize gene silencing.

UNIT - I

PLASMIDS, TRANSPOSONS / VECTORS FOR GENE TRANSFERS: Plasmids- definition, types, identification, classification, purifications and transfer of plasmids. Host restriction in transfer; Transposable elements- definition, detection of transposition in bacteria, types of bacterial transposons, mechanisms of transposition and excision; Applications of transposons, retrotransposons; Enzymes involved in genetic engineering; Different types of cloning vectors- plasmid (pUC 19), lambda phage, cosmid, M13, BAC, YAC and YEP.

UNIT - II

EXPRESSION AND DETECTION OF CLONES: Cloning strategies; sequencing; DNA fingerprinting; Blot analysis- Southern, Northern, Western blot; Dot and slot blot; PCR- principles, designing of primers, methodology and applications of PCR.

UNIT - III

MOLECULAR TECHNIQUES: Purification of genomic DNA from living cells; Manipulation of purified DNA; Introduction of DNA into living cells - methods of gene transfer; DNA hybridization.

UNIT - IV

GENE REGULATION IN PROKARYOTES AND EUKARYOTES: Prokaryotes - lactose, arabinose and tryptophan operons; Repressors and activators; Sigma switch in *Bacillus subtilis*; Eukaryotes - gene regulation, promoters and enhancer elements; Gene rearrangement; Gene amplification.

UNIT - V

HISTONES, RNA AND EPIGENETIC MECHANISMS: Types of histones and their participation in compact and relaxed genomes; DNA methylation; Histone modifications; Acetylation; RNA silencing; Micro RNA; RNAi-mediated gene regulation; Methods of detecting epigenetic mechanisms – interplay of epigenetic mechanisms in development, differentiation, regeneration and aging.

ACTIVITIES:

- Culture bacterial cells.
- Isolaton of bacterial and plasmid DNA.
- Handling micropipettes to deal with molecular enzymes.
- Experimentation on gel electrophoresis.
- Preparation of competent cells.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Isolation of plasmid DNA by alkaline lysis method from *E.coli*.
2. Restriction analysis of plasmid DNA and analysis by agarose gel electrophoresis.
3. Amplification of gene by polymerase chain reaction (PCR).
2. Preparation of competent cells by calcium chloride treatment for plasmid transformation.
3. Setting up of ligation reaction using T4 DNA ligase.
4. Transformation of chemically competent *E. coli* with the ligation mixture, plating and analysis of transformants.
5. Setting up a dephosphorylation reaction using alkaline phosphatase enzyme.
6. Cloning of gene into a plasmid vector and transformation to *E. coli*.

TEXTBOOK:

1. T.A.Brown, “Gene Cloning and DNA analysis”, 5th edition, Blackwell Scientific Publications, 2006.

REFERENCE BOOKS:

17HS001 RESEARCH METHODS

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

Objective of the course is to enable research scholars to have a general understanding of research methods and application of statistical tools in the analysis and interpretation of findings and guidelines for report writing.

UNIT - I

Introduction: Nature and Importance of research, the role of business research, aims of social research, research process, types of research. Data Base: discussion on primary data and secondarydata, probability and non-probability sampling techniques.

UNIT-II

Research design: Meaning of research design. Functions and goals of research design. Questionnaire and Schedule.

UNIT – III

Measurement and scaling concepts: Attitude measurement, levels of measurement and types of scales, criteria for good measurement. Measures of central tendency, measures of dispersion,measures of variation, Correlation and Regression. Statistical Inference. Tests of significance for small samples, t-test, Chi-Square test and ANOVA-one way and two way classifications. Discriminateanalysis, cluster analysis, conjoint analysis

UNIT-IV

Technical Report Writing: Pre-writing considerations, Thesis writing, formats of report writing, Formats of publications in Research Journals. Technique of Interpretation, Precaution inInterpretation, Significance of Report writing, Different steps in writing Report, Layout of theResearch Report, Types of Reports, Report Format, Typing Instructions, Oral Presentations.

UNIT-V

Research Ethics and Morals: Issues related to plagiarism, collaborative models and ethics, Acknowledgements. *Intellectual Property Rights:* copy rights.

***Course Description and Objectives*:**

This course helps to familiarize students with the downstream section of a bioprocess for the production of biotechnological products. To familiarize the student regarding removal of insoluble's, product isolation, high-resolution techniques and product polishing.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- *Design the fermentation medium*
- *Operate the electrophoresis unit*
- *Use the chromatographic methods*
- *Understanding of current purification technologies*

SKILLS:

- ✓ *Able to separate the product of interest*
- ✓ *Able to eliminate trace contaminants and impurities*
- ✓ *Able to operate sonicator*
- ✓ *Able to use the chromatography techniques*

UNIT - I

Upstream processing: Integrated bioprocesing, Inoculum media for industrial fermentation, Fermentation Media - Media composition, Media sterilization and contamination, Media economics, Screening for fermentation media.

UNIT - II

Primary Separation and Recovery Processes: Cell disruption methods for intracellular products, removal of insolubles, Biomass (and particulate debris) separation techniques, flocculation and sedimentation, centrifugation and Filtration methods.

UNIT - III

Enrichment Operations: Membrane based separations micro and ultra filtration theory, design and configuration of Membrane separation equipment, applications, Precipitation methods (with salts, organic solvents, and polymers) Extractive separations, aqueous two-phase extraction, Insitu product removal.

UNIT - IV

Product Resolution / Fractionation and polishing: Adsorptive chromatographic separation processes, Electrophoretic separations (all electrophoresis techniques including capillary electrophoresis), Gel Permeation Chromatography, dialysis, Crystallization.

UNIT - V

New and Emerging Techniques:

Pervaporation, Super critical extraction, foam based separation, Product recovery trains-few examples.

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Chromatography techniques - Paper, TLC, HPLC, Gel filtration & Ion exchange chromatography.
2. Electrophoresis &Blotting techniques-Native- PAGE, SDS-PAGE &Western Blot technique.
3. Solid separation methods - Filtration, Sedimentation, Centrifugation, Product enrichment operations – Liquid-Liquid extraction and Two-phase aqueous Extraction.
4. Protein precipitation and its recovery.
5. Product crystallization and drying.

ACTIVITIES:

- *Preparation fermentation medium*
- *Use of chromato graphy techniques for separation of bioproducts*
- *Use of Electrophoresis units and gel preparation*
- *Experiments on Cell disruption methods*

TEXT BOOKS:

1. James E Bailey, David F., "Ollis, Biochemical Engineering Fundamentals", 2^{nd} Ed., Mc Graw Hill, 1993.

3. McCabe, Smith, Harriott, "Unit Operations of Chemical, Engineering", 5^{th} ed.,Tata Mc Graw Hill.

17BT004 BIO ANALYTICAL TECHNIQUES

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P
45	-	30

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The objective of this course is to understand the scope of application, advantages and limitations of the various modern analytical and separation techniques.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- *Understand the principles involved in functioning of various instruments and noise in instrumental measurements*
- *Understand the advantages and limitations of various analytical techniques.*
- *Learn different separation techniques.*

SKILLS:

✓ Skilled handling of microscope.
✓ Handling of various modes in UV Visible spectrophotometer.
✓ Chromatography techniques.
✓ Experience in working with data sets.

ACTIVITIES:

- Qualitative and quantitative analysis of biomolecules.
- Purify biomolecules from plants.
- Compare different analytical methods to estimate enzymes.

UNIT - I

SPECTROSCOPY: Principle, instrumentation and application of Colorimeter, UV – Visible Spectrophotometer, IR spectrophotometer, Flourimeter, Flame photometer, x-ray spectroscopy, NMR spectroscopy.

UNIT - II

MICROSCOPY AND ELECTROPHORESIS: Basics of phase contrast, confocal and fluorescent microscopy; electron microscopy – SEM and TEM; Flow cytometry; Electrophoresis – principles, supporting materials-paper, starch, agarose, polyacrylamide types – gel and capillary electrophoresis; disc; Isoelectric focussing; immuno-electrophoresis; isotachophoresis.

UNIT – III

CHROMATOGRAPHY: Chromatography – principles; types - paper, thin layer, adsorption, ion-exchange, affinity, gel filtration, gas liquid and HPLC; GC-MS; Simulation moving bed.

UNIT - IV

RADIOACTIVE TECHNIQUES: Radioactive isotopes, radioactive decay and their types; principles of scintillation counting; isotope dilution technique; radioactive techniques-RIA; GM counter; Scintillation counter; Autoradiography; Applications in Medicine & Diagnosis; Radiation hazards and methods for containment and prevention.

UNIT – V

THERMO ANALYTICAL TECHNIQUES: Theory of thermal analysis; thermo gravimetric; Basic theory, construction and working of Differential Thermal Analysis (DTA); Differential Scanning Calorimeter (DSC).

LABORATORY EXPERIMENTS

LIST OF EXPERIMENTS Total hours: 30

1. Verification of Lambert -Beers Law by UV -VIS spectrophotometer.
2. Estimation of reducing sugars (Benedict's method).
2. Estimation of proteins and nucleic acids by U.V. method.
3. Separation of different macromolecules by HPLC.
4. Estimation of vitamin B by turbidometry method.
5. Estimation of turbidity by U.V. method.
6. Estimation of chlorophyll by colorimetric method.
7. Determination of lambda max.
8. Calibration of pH meter.

TEXT BOOKS:

1. Willard and Merrit, "Instrumental Methods and Analysis" . 6th ed, CBS Publishers & Distributors.
2. Keith Wilson, Kenneth H. Goulding, "A Biologist Guide to Principles and Techniques of Practical Biochemistry", 3rd ed., ELBS series.
3. Skoog and West, "Fundamentals of Analytical Chemistry", 1982.

REFERENCE BOOKS:

1. Ewing GW, "Instrumental Methods of Chemical Analysis", Mc Graw Hill Book Company, 1989.
2. Braun. H, "Introduction to Chemical Analysis", McGrawHill, 1987.

17BT006 PLANT DESIGN AND ECONOMICS FOR BIOTECHNOLOGISTS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	15	-	-	-	-	-	-	-

Course Description and Objectives:

This course is oriented towards the bioreactor requirements for handling different types of biomass and economics of bioreactor fabrication and plant maintenance. The objective of this course to give immense knowledge on types of bioreactors, design and operation of bioreactors. It also discusses about plant design and economics related to plant construction and operation.

Course Outcomes:

The student will be able to:

- Gain knowledge on concepts of reactor design.
- Design, develop, operation and controlling of bioreactor
- Develop flow diagrams for plant design and construction
- Estimate product cost and depreciation cost of plant equipement

SKILLS:

- General plant design considerations
- Design considerations for plant and animal cell cultures
- Economic issues related to plant construction and operation
- Estimate replacement costs and profitability.

ACTIVITIES:

- Design of flow sheet for plant construction
- Design of bioreactor for plant and animal cell cultures
- Feasibility survey for development of new product
- Estimation of replacement cost of new equipment.

UNIT - I

INTRODUCTION: Introduction, types of bioreactors: stirred-tank bioreactors, airlift bioreactors. Heat transfer. Scale up: stirred-tank bioreactors, airlift bioreactors. Introduction of airlift bioreactors, design and construction of the airlift-loop reactor. air-lift reactor microgravity, loop reactors and fluid bed reactors. New Bio reactors for aerobic processes.

UNIT - II

DESIGN ASPECTS: Agitated vessels, flowpatterns, flownumber, velocity patterns and velocity gradients, power consumptions, power correlations, power consumption in non newtonian liquids, agitator selection and scaleup. **Hydrodynamics:** Two-phase flow, mixing, oxygen transfer, isobaric method, non-isobaric model, oxygen transfer in a three phase flow.

UNIT - III

BIOREACTOR DESIGN FOR PLANT & ANIMAL CELLS CULTURE: Introduction, plant cells: plant cell bioreactors, characteristics of plant cell suspensions, plant cell bioreactor requirements, plant cell bioreactor design, plant cell bioreactor operation, alternative cultures for plant cells.Animal cells:Animal cell bioreactors, animal cell bioreactor operation, and animal cell bioreactor design.

UNIT - IV

DESIGN AND COST CONSIDERATIONS: General design considerations, Cash flow for industrial operations, capital investments, estimation of capital investments, cost indices, estimation of total product of cost direction, production costs, fixed charges, plant overhead costs, financing. Interest and investment cost, type interest, nominal and effective interest rates, continuous interest, present worth and discount annuities

UNIT - V

DEPRECIATION AND PROFITABILITY: Depreciation: types of depreciation, services life, salvage value, present value, methods for determining depreciation, single unit and group depreciation. Profitability: alternative investments and replacements, profitability standards, discounted cash flow, capitalized cost, pay out period alternative investments, analysis with small investments, increments and replacements.

17BT008 BIOPROCESS MODELING CONTROL & SIMULATION

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	15	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course deals with the basic models in bioprocess engineering. The main intention of this course is to provide knowledge of various parameters to be considered in bioprocess and control and simulation of bioprocesses.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- Understand the basic concepts of modeling.
- Develop models for bioprocesses.
- Design, operate and analysis of bioreactors.
- Simulate bioprocess models for optimum product yield.

SKILLS:

- ✓ *Modeling of fermentation processes*
- ✓ *Basic fundamental laws used in modeling*
- ✓ *Parameter estimation for enzyme kinetics and Monod equation*
- ✓ *Various simulation techniques*

ACTIVITIES:

- Development of mathematical models for bioprocesses
- Design and operation of bioreactor
- Simulation of mathematical models using computer software
- Validation of mathematical models.

UNIT - I

INTRODUCTION TO MODELING: Process Design – Process Synthesis, Process Analysis, Optimization, Strategy for Process Engineering, Process Plant Simulation; Modeling Aspects – Physical Modeling, Mathematical Modeling, Model Formulation Principles, Fundamental Laws used inModeling, Cybernetics, Controlled System and Principles of Similarity.

UNIT - II

THE KINETICS OF ENZYME–CATALYZED REACTIONS: Michaelis–Menton Kinetics, Evaluation of Parameters in the Michaelis–Menton Equation: Kinetics of Substrate Utilization, Product Formation and Biomass Production in cell cultures – Ideal Batch Reactor, Ideal Continuous-FlowStirred–Tank Reactor (CSTR),Monod Growth Kinetics, Monod Chemostat Model, and Product yield coefficient and Growth-Cycle Phases for Batch Cultivation.

UNIT - III

DESIGN AND ANALYSIS OF BIOLOGICAL RECTORS: Ideal Bioreactors – Fed Batch Reactors, Enzyme- Catalyzed Reactions in CSTRs, CSTR Cell eactorswith Recycle and Wall growth, The Ideal Plug-flowTubular Reactor, Dynamic Models.

UNIT - IV

MODELING OF FERMENTATION PROCESSES: System Analysis Approach to the Mathematical Modeling of fermentation processes – Kinetics of Simple Processes, Stoichiometry of Microbial Processes, Physiological Aspects of Mathematical Models for Fermentation Processes, Modeling of Oxygen Transfer, and The use of Simple Mixing Models for Simulation of Fermentation Processes; Mathematical Model Identification– Preliminary Analysis of Experimental data, Rate Relationship and Kinetic Parameters.

UNIT - V

FUNDAMENTALS OF MASS BALANCING: Mass Balances - Systems without Chemical Reactions, Study State Processes without Chemical Reactions, Intermittent Operation without Reactions; Systems with Chemical Reactions – Processes with (bio) Chemical Reactions, Steady state system with chemical reactions, Intermittent operation with Chemical Reactions. Transient Mass Balances – A Perfectly Stirred Tank Model, Transient Mass Balances with Reactions. The Plug Flow Model.

17HS002 EMPLOYMENT ORIENTATION PROGRAM

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Preamble:

It is common knowledge that students opting for the Masters Programme after B.Tech do so either because they have been unsuccessful in securing employment after their Bachelors or because they have not crystallized their career plan. Hence, students opting for M.Tech are found to be deficient not only in the technical knowledge but also in their communication skills and overall personality. There is a need to groom them and shape them into employable resources.

Program Objectives:

i. To impart employability skills to M.Tech. final students by honing their interpersonal and presentation skills.

ii. To equip them with the latest tools and techniques for effective communication through discussions, group work, presentation exercises, assignments, projects etc.

iii. To impart training for their overall personality development and shape them into confident, positive and ambitious professionals.

Course Contents

The course content, designed for 50 Hrs will comprise two modules:

- Communication skills & Overall personality improvement (10 * 2.5 = 25 Hrs)
- Pedagogy of Engineering Subjects & Making Project Presentations (10 * 2.5 = 25 Hrs)

Rationale for the Programme

On a more holistic view of higher education, the term “academic development” refers to development of multiple aspects of a student’s personality under this EOP for M.Tech

students, different types of development are envisaged like personal, interpersonal skills, career development and life planning. “Development” in the engineering education

according to national accreditation bodies like NBA and NAAC is understood to happen through activities and programmes designed to improve the ability to work to teams, express themselves confidently to their peers and present their views boldly before an audience and

get things accomplished through management of men and materials. This programme will improve student’s overall communication skills and raise his/ her potential as an employee graduate.

About this Programme

The 50 Hrs course will be rolled out in two spells of 25 Hrs each with the help of in-house and invited experts. It is aimed at improving the presentation skills in general and teaching ability of the M.Tech students in particular. AFD will seek the cooperation of all the Deans, HoDs and senior professors as subject experts, mentors from the departments to provide the essential knowledge and skill inputs for the trainees so that the course outcomes can be realized.63

Expected Outcomes:

Having gone through the 50 hrs rigorous training on presentation skills, pedagogy and overall personality grooming, the trainees will get equipped to face any interview confidently, make short and effective presentations during interviews and gain the confidence to handle engineering topics and perhaps also develop an aspiration for a career in teaching.

The trainees will be assessed for a total of 50 marks, which will be incorporated into the II year project marks. The summative assessment will be carried out by a special panel constituted for the purpose in consultation with the Dean, Evaluation and respective HoD.

- 5 Marks for attendance
- 5 Marks for formative assessment
- 40 Marks for summative assessment

17BT009 ADVANCED PROCESS ENGINEERING PRINCIPLES-I

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	-	-	-	-	-	-

Course Description and Objectives:

This course mainly deals with basic principles necessary quantification and regulation of fluid flow in process industries. it describes different types of flow, development of empirical equations for fluid flow in pipes, frictional losses in fluid flow, measurement of fluid flow. The objectives of this course are to impart knowledge of fluid flow behavior, flow measurement.

Course Outcomes:

The student will be able to:

- Get knowledge on basic concepts of fluid flow.
- Development of empirical equations for fluid flow in pipes
- Estimate fractional losses in fluid flow.
- Measure the flow rate using different flow measuring devices

SKILLS:

- ✓ Characterization of flow behavior
- ✓ Analysis of various types of losses in fluid flow
- ✓ Estimation of terminal velocities of particles
- ✓ Calculation of power requirement for pumping of fluids

ACTIVITIES:

- Calibration of Bernoulli's theorem
- Estimation of frictional losses with different types of fitting to pipes
- Calculation of capacity of pump required for pumping of fluid using centrifugal pump
- Flow measurement using venturimeter.

UNIT - I

INTRODUCTION TO PROCESS ENGINEERING PRINCIPLES: Introduction to unit operations and unit processes, Units and dimensions, basic quantities and derived units. Conversion of units. Concept of mass and force, definition of g_c and its utility. Various equations of state including ideal gas law to evaluate P-V-T data, their, application in process calculations by solving basics numerical problems.

UNIT - II

RHEOLOGY OF FLUIDS: Newton's law of viscosity. Concept of Newtonian and non - Newtonian fluids, Different types of non-Newtonian fluids with examples in bioprocesses. Fluid mechanics-Properties of fluids, fluid statics, and energy balance in fluid flowthrough pipes and conduits, Bernoulli's equation and its application, calculation of power required for pumping fluids. Examples from bioprocess systems.

UNIT - III

MOMENTUM TRANSFER: Flow through pipes, Laminar and turbulent flow characterization by Reynolds number, average velocity, pressure drop due to skin friction and foam friction, friction factor chart, Hagen-Poiseuille equation

UNIT - IV

DRAG AND SETTLING: Flow past immersed bodies: Definition of drag and drag coefficient. Introduction of the concept of packed beds. Friction in flow through beds of solids, derivation of friction factor equations and pressure drop expressions. Motion of particles through fluids, terminal velocity.

UNIT - V

MEASURING AND TRANSPORTATION: Fluid transportation machinery: Different types of pumps, positive displacement pumps, reciprocating Pumps, diaphragm pumps, centrifugal pumps, Calculation of pump horse power. Flow measuring devices-manometers, orifice meter, venture meter and rotameter

17BT011 BIOINFORMATICS AND MOLECULAR MODELING

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course offers basic concepts in computational skills and computational methods to study, organise, analyse and interpret biological information at molecular, genetic and genomics levels. It also offers knowledge on an overall understanding about the critical relationship among biomolecular structure, function and force field models. The objective of this course is to introduce the analysis of biological data using software tools and is to train students in utilizing basic modelling techniques to explore biological phenomena at the molecular level

Course Outcomes:

The student will be able to:

- Demonstrate understanding of biological sciences by articulating the methods of science, explaining why current biological knowledge is both contestable and testable through further inquiry and explaining the role and relevance of biotechnology in society.
- Gain software skills to critically analyze and solve problems in biotechnology.
- Demonstrate cognitive skills in mastery of advanced theoretical knowledge in bioinformatics and apply this knowledge to solve complex problems.
- Understand the principles and practice molecular modelling and modern drug discovery

SKILLS:

- ✓ Design, conduct and interpret scientific research on bioinformatics.
- ✓ Conduct statistical analysis of biological data pertaining to genomics and proteomics.
- ✓ Apply a scientific approach to problems involving molecular phylogeny.
- ✓ Estimate energy minimization upon docking

ACTIVITIES:

- Retrieval of FASTA format from databases.
- Perform BLAST and FASTA software analysis for both nucleic acids and amino acid sequences.
- Construct phylogenetic trees using software tools such as PHYLIP and PAUP.
- Perform protein homology modelling.

UNIT - I

INTRODUCTION: Scope of Bioinformatics, Elementary commands and protocols,ftp, telnet, http. Primer on information theory. DNAMapping and sequencing –Map alignment – Large scale sequencing methods - Shotgun – DNA sequencing – Sequence assembly.

UNIT - II

SEQUENCE ALIGNEMENT AND DYNAMIC PROGRAMMING &PHLOGENY: Heuristic Alignment algorithms. Global sequence alignments-Neddleman-Wunsch Algorithm, Smith-Waterman Algorithm-Local sequence alignments (Amino acid substitutionMatrices (PAM, BLOSUM).

Ultrasonic trees – parsimony – Ultrametric problem – Perfect phylogeny – Phylogenetic alignment – connection betweenmultiple alignment and tree

UNIT - III

BIOLOGICAL DATABASE AND THEIR USE: Introduction to Biological databases, Organization and management of databases. Searching and retrieval of information from the World Wide Web. Structure databases - PDB (Protein Data Bank), Molecular Modeling Databases (MMDB). Primary Databases NCBI, EMBL, DDB. Swissprot, PIR,KEGG. Bio Chemical databases- KEGG, EXGESCY, BRENDA, WIT

UNIT - IV

INTRODUCTION TO MOLECULAR MODELLING : Introduction - Useful Concepts inMolecularModelling: Coordinate Systems. Potential Energy, Surfaces. Molecular Graphics. Surfaces.Computer Hardware and Software. TheMolecular Modelling Literature. Force Fields, Bond Stretching,Angle Bending, Introduction to Non-bonded Interactions. Electrostatic Interactions. Van der Waals Interactions.Hydrogen Bonding inMolecular Mechanics. Force FieldModels for the Simulation of LiquidWater.

UNIT – V

EnergyMinimisation andRelatedMethods for Exploring the Energy Surface. Non-Derivativemethod, 1st and 2nd orderminimisationmethods.Computer SimulationMethods. Simple Thermodynamic Properties and Phase Space. Boundaries. Analyzing the Results of a Simulation.

17BT013 MICROBIOLOGY AND BIOCHEMISTRY

Hours Per Week :

L	T	P	C
3	3	-	3

Total Hours :

L	T	P
45	-	-

xxxx

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To familiarize the student to understand about classification, diversity and physiology of microorganisms. Also to acquaint about the methods of microbe cultivation and sterilization techniques as well as microbial diseases, host pathogen interaction and their control. The major objective of the course is the complete understanding of the entire chemical processes associated with living cells at the molecular level.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- Understand the scope and historical developments in the field of microbiology.
- Identify and classify the microorganisms based on various attributes.
- Cultivate pure cultures using specific as well as enrichment media.
- Understand the structures and functions of biological molecules and interactions.
- Gain sufficient insights into redox biochemistry.
- Acquire knowledge on various pathways in intermediary metabolism and bioenergetics.

SKILLS:

- ✓ Handle different microscopes.
- ✓ Isolate microbes.
- ✓ Aseptic maintenance of lab and hood.
- ✓ Maintain stock cultures.
- ✓ Identify biomolecules by colorimetric and biochemical assays.
- ✓ Quantify macromolecules using UV-VIS Spectrophotometer.
- ✓ Operation of HPLC.

ACTIVITIES:

- Isolate microbes from different sources – air, soil and water.
- Purify different strains of bacteria and fungi.
- Carryout sterilization processes.
- Estimate macromolecules in biological fluids.
- Model exercises on building structures of Macromolecules.

UNIT - I

INTRODUCTION TO MICROBIOLOGY: Discovery of microorganisms, Theory of spontaneous generation, Germ theory of diseases, Major contribution and events in the field of Microbiology, Scope and relevance of microbiology, Development of pure culture methods, Enrichment culture methods, Development of microbiology in twentieth century.

UNIT - II

MAJOR GROUPS OF MICROORGANISMS: Micro diversity, Diversity classification of Woese *et al*. Three domains of life. Five - kingdom system of Whittaker. Classification systems - Phylogenetic, Phenetic, Taxonomic ranks, Major characteristics used in Taxonomy, Molecular approaches to microbial taxonomy, Structural organization and multiplication of bacteria, viruses, algae and fungi.

UNIT - III

MICROBIAL GROWTH AND GENETIC SYSTEM: Theory and practice of sterilization, Principles of microbial nutrition, Construction of culture media, Enrichment culture techniques for isolation of chemoautotrophs, chemoheterotrophs and photosynthetic microorganisms. Growth factors and their functions in metabolism. Aerobic and anaerobic metabolism, Definition of growth, Growth curve, Availability of oxygen, Culture collection and Maintenance of cultures. Bacterial genetic system-Transformation, Conjugation and Transduction.

UNIT - IV

INTRODUCTION TO BIOMOLECULES: Biomolecules- Occurrence, classification, structure, properties and functions of carbohydrates, proteins, lipids and vitamins, Stabilization of proteins and nucleic acids, Structural and functional relationships in complex carbohydrates, proteins and nucleic acids.

UNIT - V

METABOLIC PATHWAYS AND PROTEIN TARGETING: Metabolic pathways of Carbohydrates, Lipids, Proteins, Amino acids and Nucleic acids. Bioenergetics- Redox biochemistry, energy rich compounds, respiratory chain, oxidative phosphorylation and triose phosphate cycle. Plasma membrane structure and transport, Protein targeting.

17BT015 ADVANCED PLANT AND ANIMAL BIOTECHNOLOGY

Hours Per Week :

L	T	P	C
3	3	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	-	-	-	-	-	-

Course Description and Objectives:

This Course was designed to provide the advanced concepts and industrial applications in the field of agricultural biotechnology.Production of high yielding, disease resistant crop varieties by using plant transformation technology. Introduction and concepts about Structure and organization of animal cell lines and stems cell culture and embryonic development to enhance the live stock production for the future needs. Concepts of Molecular farming and production antibiotics, plantibodies from GM organisms. To provide students opportunities to participate in R&D projects, and develop clinical and laboratory research skills.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- *Acquaint with principles, scientific and commercial applications in plant tissue culture technology and transformation techniques.*
- *Be familiar with sterile techniques, media preparation.*
- *Gain knowledge of how plants can be transformed with respect to pest resistance, herbicide tolerance.*
- *Support methodologies in plant tissue/cell culture, horticulture and floriculture to plant improvement.*
- *How to modify physiological processes to obtain biotechnological products to be applied to agricultural, social and medical areas.*

SKILLS:

- ✓ Maintenance of the sterility of the plant tissue culture lab.
- ✓ Extraction of explant from various sources of the plant.
- ✓ Design of polyhouse, Development of callus from explant.
- ✓ Hardening and acclimatization of clone.
- ✓ Maintenance of animal celllines in laboratory.

ACTIVITIES:

- *Multiplication of ornamental explants by micropropagation.*
- *Visit to plant/seed company to understand the micro propagation and genetic transformation of commercial crops.*
- *Visualize cell division under microscope.*
- *Observe different cell lines isolated from various sources*

UNIT - I

INTRODUCTION TO TISSUE CULTURE & APPLICATIONS: An over view and important concepts of tissue culture and tissue engineering technology, its applications in various fields. Embyo culture and embryo rescue. Anther, pollen, ovary, ovule, nucellus culture, Endosperm culture for production of haploid plants and homozygous lines. Germplasm conservation (Cryopreservation); Hardening & Field transformation of cultured Plants;

UNIT - II

PLANTGENETICENGINEERING FOR PRODUCTIVITY AND PERFORMANCE (BIOTIC & ABIOTIC STRESS): Gene transformation technology-Agrobacterium mediated gene transfer; Agrobacterium based vectors, viral vectors and their application. Direct gene transfer methods; chemical methods, electroporation, microinjection, particle bombardment Herbicide resistance, Insect resistance, Disease resistance, virus resistance,. Abiotic stress tolerance ;Drought, temperature, salt tolerance.

UNIT - III

ANIMAL BIOTECHNOLOGY: Primary culture – Mechanical and enzymatic mode of desegregation, establishment of primary culture. Subculture -passage number, split ratio, seeding efficiency, criteria for subculture. Cell cycle; primary cell culture; nutritional requirements for animal cell culture; techniques for mass culture of animal cell lines.

UNIT - IV

TECHNIQUES OFANIMAL BIOTECHNOLOGY: *In vitro* fertilization - Concept of superovulation, collection, maintenance, andmaturation of oocytes, fertilization of oocytes, Maintenance and assessment of embryos, embryo transfer -Artificial insemination, preparation of foster mother, surgical and non-surgical methods of embryo transfer, donor and recipient aftercare.

UNIT - V

MOLECULAR FARMING & INDUSTRIAL PRODUCTS: Production of secondary metabolites from plants and animals, principles and mechanisms of Processes for enhancing the production of secondarymetabolites. Technology of plant cell culture for production of chemicals; Bioreactors systems andmodels for mass cultivation of plant and animal cells.

Applications of Plant and Animal biotechnology principles for the production of quality oil, Industrial enzymes, Antigens (edible vaccine) and plantibodies. Application of animal cell culture for production of vaccines, growth hormones; interferons, cytokines and therapeutic proteins.Hybridization of cell lines, stem cells and its application in organ synthesis; transgenic animals andmolecular farming.

17BT017 MASS TRANSFER SEPARATIONS

Hours Per Week :

L	T	P	C
3	3	-	3

Total Hours :

L	T	P
45	-	-

xxxx

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course deals with the major chemical separation process units, selection among alternate separation technologies. The main intention of this course is to provide complete design calculations for mass transfer equipment.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- Understand various classes of mass transfer operations.
- Estimate mass transfer rates of diffusion components .
- Understand concepts of humidification, drying, distillation and extraction
- Determination of no. of stages or trays required for given separation of components.

SKILLS:

- ✓ Design media for fermentation.
- ✓ Generate probiotics.
- ✓ Generate recombinant proteins.

ACTIVITIES:

- Estimation of diffusivity of gases and liquids
- Determination of batch drying curve
- Determination of no. of trays required for distillation column using McCabe- Thiele method
- Performing leaching and extraction techniques

UNIT - I

DIFFUSION AND MASS TRANSFER COEFFICIENTS: The Mass TransferOperations: Classification of theMass –Transfer Operations, Choice of SeparationMethod,Methods of Conducting the Mass-Transfer Operations, Design Principles, Molecular Diffusion, Steady StateMolecular Diffusion in Fluids at Rest and in Laminar Flow, estimation of diffusivity of gases and liquids, type of solid diffusion. Types of mass transfer coefficients, Dimensionless numbers, explanation of mass transfer coefficients by various theories, diffusion between phases.

UNIT - II

HUMIDIFICATION: Vapor-Pressure Curve, Definitions, Psychometric Charts, Enthalpy of gas-vapor Mixtures, Humidification and Dehumidification. **DRYING:** Drying equilibrium, batch drying under constant drying conditions, mechanisms of batch drying, rotary dryer, drum dryer, spray dryer.

UNIT - III

DISTILLATION: Fields of applications, VLE for miscible liquids,immiscible liquids, Positive and negative deviations from ideality, enthalpy-concentration diagrams, flash vaporization and differential distillation for binary andmulti component mixtures. Continuous rectification-binary systems, multistage tray towers –method of Mc Cabe and Thiele, enriching section, exhausting section, feed introduction, total reflux, minimum and optimum reflux ratios, packed distillation column, Steam distillation.

UNIT - IV

EXTRACTION OPERATIONS: LIQUID-LIQUID EXTRACTION: Fields of usefulness, liquid-liquid equilibrium, equilateral triangular co-ordinates, choice of solvent, multistage wise extraction. **LEACHING:** Fields of applications, preparation of solid for leaching, types of leaching, leaching equilibrium, Single stage and multi stage leaching calculations.

UNIT - IV

ADSORPTION: Adsorption, types of adsorption, nature of adsorbents,adsorption equilibrium, Adsorption Hysteresis, effect of temperature, Heat of adsorption, stage wise operations. **CRYSTALIZATION:** Crystal geometry, equilibria and yields,supersaturation, classification of crystallisers, material balance of crystalisers.

TEXT BOOKS :

1. Robert E. Treybal, “Mass Transfer Operations”, 3rd ed.,Mc. Graw Hill, International Year.
2. Binay. K.Dutta, “Principles of Mass Transfer and Separation Processes”,Prentice Hall of India, New Delhi, 2007.

1. Alapati Suryanarayana “Mass Transfer Operations”, 1st Edition,New-Age, International, 2006.
2. Seader. J. D, E. J. Henley& D.Keith Roper, “SeparationProcesses Principles”, John Wiley & sons, New York, 2010.

17BT019 ADVANCED FERMENTATION TECHNOLOGY

Hours Per Week :

L	T	P	C
3	3	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The course offers knowledge on the methods employed in producing food products by fermentation. The objective of the course is to provide outline on fermentation processes for the production of primary and secondary metabolites of commercial importance.

Course Outcomes:

The student will be able to:

- *Explore the modes of production of traditional and modern Biotechnology products.*
- *Understand production of commercially important metabolites.*
- *Gain knowledge on production of fermented food products.*

SKILLS:

- ✓ Design media for fermentation.
- ✓ Generate probiotics.
- ✓ Generate recombinant proteins

ACTIVITIES:

- Produce and analyze antimicrobial activity of antibiotic compounds.
- Produce polyhydroxy butyrate.
- Produce enzymes and recombinant proteins

UNIT - I

FERMENTATION PROCESS: General requirements of fermentation processes, Basic design and construction of fermentor and ancillaries, Main parameters to be monitored and controlled in fermentation processes; An overview of aerobic and anaerobic fermentation processes and their application in the biotechnology industry, solid-substrate, slurry fermentation and its applications, whole cell immobilization, behaviour of microbes in different reactors (air lift, fluidized, batch, continuous and fed batch condition).

UNIT - II

BIOPROCES OPTIMIZATION: Nutrient requirement for fermentation process- macro and micronutrients, renewable energy sources (carbon and nitrogen), Conventional optimization process (one variable at a time approach), need for statistical experimental desing, screening techniques-Plackett Burman design, response surface methodology-Box-Benken desing, central composite desing and self directing optimization

UNIT - III

PLANT AND ANIMAL CELL CULTIVATION: Plant and animal cells compared to microbial cultivation, Bioreactor considerations for plant cell-suspension culture, immobilazation culture and organized tissues. Methods used for cultivation of animal cells, Bioreactor conideration for animal cell culture-suspension culture, anchorage dependent cultivation. Imporant industrial products from plant and animal cell cultivation.

UNIT - IV

PRODUCTION OF METABOLITES: Outline of processes for the production of some commercially important organic acids, Amino acids, Alcohols, Antibiotics- beta-lactams (penicillin, cephalosporin etc.), Amino glycosides (streptomycin etc.), Macrolides (erythromycin); Vitamins and steroids.

UNIT - V

PRODUCTION OF BIOPRODUCTS: Production of industrial enzymes; Recombinant proteins, Biopolymers (xanthan gum, PHB etc.); Single cell protein production and its uses. Probiotic foods-curds, cheese and yogurt.

TEXTBOOK:

17FT010 IMMUNOTECHNOLOGY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	-	-	-	-	-	-

Course Description and Objectives:

This course deals with the manoeuvring of host defence system and immune cells. The main intention of this course is to provide students ample knowledge on the principles of diagnostic kits and adopt informatics tools such as IMGT database to study immune susceptibility.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- Apply principles of immune system to develop nano-based diagnostic kits.
- Learn various immune techniques to evaluate deformities in immune system
- Isolate and purify immunoglobulins and antigens
- Predict epitope mapping through informatics tools and population susceptibility to diseases through HLA and KIR database.

SKILLS:

- ✓ Handling animal cells, CO2 incubator, ELISA and inverted microscope
- ✓ Immunization of lab animals
- ✓ Skills on immunodiffusion techniques
- ✓ Purification of IgG, IgY
- ✓ Nano-based immunodiagnostics

ACTIVITIES:

- Preparation of antigens and dose fixation
- Isolation of lymphocytes
- Harvesting antibodies
- Seminar presentation of immune-compromised case studies
- Development of nano-based Immunodiagnostic kits

UNIT - I

TYPES OF IMMUNITY & ANTIGENS: Innate and Adaptive Immune responses, Immune Cells: immune-competent, immune-accessory, immune-compromised and immune-conditioned cells. Lymph nodes and Organs of immune system, Antigens – epitopes, antigenicity, factors influencing antigenicity. Adjuvants, Haptens, Antigen processing and presentation, Major Histocompatiblity Complex (MHC),

UNIT - II

IMMUNOGLOBULINS AND TYPES OF IMMUNE RESPONSES: Isotypes, allotypes and idiotypes, Monoclonal antibodies and Chimeric antibodies - production and applications, Abzymes, Cytokines – types of immune response- Humoral and Cell mediated. Complement system.

UNIT – III

TECHNIQUES IN ANTIGEN ANTIBODY INTERACTIONS: Immunodiagnostics: Paper-based nanoparticle test kits- on RNA Virus Pandemics: detection of Dengue, Zica and Ebola, and on PSA and Pregnancy. Antibody affinity and avidity –precipitation, agglutination, Antibody harvest, ELISA, Western blot, Immunofluorescence, MLR,

UNIT - IV

T CELL & B CELL ACTIVATION: Isolation and primary culture of immune cells. Techniques for T-cell, B-cell, macrophage and WBCs isolation and differential count. T cell & B cell maturation, Autoimmunity, Inflammation. Hypersensitivity, Transplantation immunology.

UNIT – V

IMMUNOINFORMATICS: KIR and HLA gene database, Overview of bioinformatics tools for epitope prediction and epitope mimicry. Web based tools for vaccine design. IMGT database.

17BT012 COMPUTATIONAL BIOLOGY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	-	-	-	-	-	-

Course Description and Objectives:

This course deals with the various Bioinformatics techniques and tools. The main goal of the course is to inculcate knowledge on various biomolecules, sequences, structural and functional aspects and biomolecular interaction to students.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- Retrieve the biological sequences
- Predicting the 3 Dimensional structure of proteins
- Study the function of proteins
- Find the function of genes

SKILLS:

✓ Access and use databases

✓ Identification and retrieval of biological sequences

✓ Study of protein structures using visualization tools

✓ Study the biomolecular interactions

ACTIVITY:

- *Preparation of ball and stick model of protein*
- *Perform the sequence alignment*
- *Analysis of protein structure*
- *Seminar presentation on molecular modeling*
- *Seminar presentation on molecular dynamics*

UNIT - I

INTRODUCTION TO COMPUTATIONAL BIOLOGY: Introduction, Biomolecular sequence analysis – Nucleic acid sequences, Motifs – localization and extraction, Protein sequence analysis and prediction of secondary structural features.Basics of Microarray.

UNIT - II

PHYLOGENETIC ANALYSIS: Evolution, elements of phylogeny, methods of phylogenetic analysis, Phylogenetic tree of life, comparison of genetic sequence of organisms, phylogenetic analysis toolsPhylip, ClustalW.

UNIT – III

PROTEIN FOLDING AND STRUCTURE PREDICTION: Overview of protein structure, Protein folding *in vitro* and *in vivo*, Theoretical models of Folding, *In silico* folding and Protein structure prediction.

UNIT - IV

COMPUTATIONAL GENOMICS & DRUG DESIGN: Gene sequences, Open reading frames-prediction tools, Genome annotation- Eukaryotic and Prokaryotic genome annotation tools, Molecular docking methodology and programs Stages of Drug Discovery, Role of Bioinformatics in Drug Discovery.

UNIT - V

MOLECULAR DYNAMICS: Introduction, MD methodology, duration of the MD run, analysis of MD job, uses in drug designing, ligand protein interactions.

TEXT BOOKS:

17BT014 ENVIRONMENTAL BIOTECHNOLOGY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	-	-	-	-	-	-

Course Description and Objectives:

This course provides a fundamental knowledge of biological methods used in safeguarding the environment by waste treatment, energy production from waste and biological methods for minimum pollution formation.

Course Outcomes:

Upon successful completion of this course, the student will be able to

- *Undestand the types of effluent treatment processes*
- *Working principles of biological effluent process equipments*
- *Know about bio-remediation of toxic wastes and pollutants*
- *Learn the applications of biotechnology in large scale process industries*

SKILLS:

- ✓ Study about various types of pollution caused by industries
- ✓ Identification and analysis of optimum treatment of industrial effluents
- ✓ Study the working of treatment equipments
- ✓ Study the microbial interaction with the environment and its pollutants

ACTIVITY:

- Environmental monitoring of the pollutants from land and water.
- Bioremediation of pesticides
- Wasrewater treatment and analysis
- Calculation of COD and BOD
- Environmental risk assessment studies
- Seminar presentation on Environmental Biotechnology

.

UNIT - I

EFFLUENT TREATMENT – AEROBIC TREATMENT: Treatment of domestic and industrial waste waters – physical, chemical and biological, aerobic treatment methods – trickling filters, towers, RBC (rotating biological contactors), air sparged reactors, FBR (fluidized bed reactor), IFBBR (inverse fluidized bed biofilm reactory), expanded bed reactor, packed bed reactors, activated sludge process

UNIT - II

EFFLUENT TREATMENT – ANAEROBIC TREATMENT: Anaerobic digestion, anaerobic digesters, anaerobic filters, UASB (up flow anaerobic sludge blankets)

UNIT - III

BIOREMEDIATION: Introduction, biostimulation, bioaugmentation, insitu, exsitu, intrinsic and engineered bioremediation, solid phase bioremediation – land farming, prepared beds, soil piles, Phytoremediation, compositing bioventing, biosparging

UNIT - IV

XENOBIOTICS: Introduction to xenobiotics and their biodegradtion, biological detoxification, hazardous waste management of cyanide, oxalate, urea and phenols.

UNIT - V

APPLICATION OF BIOTECHNOLOGY IN MINING & FUELS INDUSTRY: Metal biotechnology of copper and iron, microbial transformation, accumulation and concentration of metals, metal leaching Production of non conventional fuels like hydrogen, alcohols and biogas, use of microorganisms in improvement of oil recovery

TEXT BOOKS:

17BT016 INDUSTRIAL BIOTECHNOLOGY AND METABOLIC ENGINEERING

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course offers an introduction to Industrial biotechnology and Metabolic Engineering and their Applications. The objective of the course is to understand the production of commercially and therapeutically important metabolites and bioproducts like enzymes, recombinant proteins.

Course Outcomes:

The student will be able to:

- *Describe various Industrial biotechnology techniques, their applications and processing of metabolic engineering.*
- *Gain knowledge on industrial equipments operations and production.*
- *Summarize current processes involved in industrial biotechnology production from plants, animals and microorganisms.*
- *Understand the different methods and analyze the industrial oriented practical knowledge.*

SKILLS:

- ✓ *Applications of metabolic flux analysis.*
- ✓ *Estimate enzyme activity by colorimetric and spectroscopic methods.*
- ✓ *Immobilize enzymes for commercial applications.*

ACTIVITIES:

- *Isolate amylase/ peroxidase/ urease from various sources.*
- *Purify the enzyme by different methods.*
- *Estimate K_M and Vmax of different enzyme reactions.*
- *Immobilize peroxidase on various substrates cloth, fabric, glass bead and encapsulation.*

UNIT - I

INTRODUCTION & APPLICATIONS OF METABOLIC ENGINEERING: Identification of metabolic regulation is a key point in metabolic engineering. Basic concepts of Metabolic Engineering – Overview of cellular metabolism – Different models for cellular reactions, induction – Jacob Monod model and its regulation, Differential regulation by isoenzymes, Feedback regulation. Applications in pharmaceuticals, chemical bioprocess, food technology, and biomass conversion.

UNIT - II

PLANT METABOLIC ENGINEERING: Study of production processes for various classes of low molecular weight secondary metabolites: Importance of Secondary Metabolites: Biosynthesis of phenolic compounds, isoprenoids, alkaloids and flavonoids; Metabolism of nucleotides amino acids and vitamins; Bioproduction; biological treatment; and related natural and engineered systems.

UNIT - III

PRODUCTION OF COMMERCIALLY IMPORTANT ENZYMES & RECOMBINANT PROTEINS: Proteases, Amylases Lipases, Pectinases, and other commercially important enzymes for the food & pharmaceutical industries; Production of recombinant proteins (Insulin, Interleukin& Interferon's) having therapeutic and diagnostic applications; production of vaccines.

UNIT - IV

BIOCONVERSIONS & REGULATION OF ENZYME PRODUCTION: Applications of Bioconversions, Factors affecting bioconversions, Specificity, Yields, Co metabolism, Product inhibition, mixed or sequential bioconversions, Conversion of insoluble substances. Strain selection, Genetic improvement of strains, Gene dosage, metabolic pathway manipulations to improve fermentation, Feedback repression, Catabolite Repression, optimization and control of metabolic activities. The modification of existing - or the introduction of entirely new - metabolic pathways. Natural Biopreservatives (Nisin), and Biopolymers (Xanthan Gumand PHB); Single Cell Protein, Racemically-pure Drug Intermediates, Steroid Bioconversions; Bioconversion of Vegetable Oils.

UNIT V:

METABOLIC ENGINEERING WITH BIOINFORMATICS: Metabolic pathway modeling, Analysis of metabolic control and the structure metabolic networks, metabolic pathway synthesis algorithms. Metabolomics, metabolomics measurements using NMR, Spectrophotometry, LCMS, and metabolic product in fermentation.

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

***Course Description and Objectives*:**

This course mainly deals with the energy requirements and design of heat transfer equipments for bioprocesses. In addition it also provides insights into thermodynamic energy functions and solution thermodynamics. The objectives of the course are to impart knowledge of thermal energy concepts, estimation of thermodynamic properties and design of heat transfer equipment for required bioprocess.

Course Outcomes:

The student will be able to:

- Estimate properties of chemical compounds and biomass.
- Determine heat of reactions at different process conditions.
- Evaluate phase equilibrium in separation operations.
- Design heat transfer equipment for bioprocesses.

✓ Estimation of change in thermodynamic properties

✓ Calculation of heat requirements of reactions

✓ Determination of properties at phase equilibrium

✓ Estimation of heat transfer coefficients

ACTIVITY:

- Estimation of efficiency of heat engine and refrigerator.
- Calculation of heat changes in fermentation process.
- Determine equilibrium constant for a chemical reaction.
- Design of heat exchanger

UNIT - I

BASICS OF THERMODYNAMICS: The scope of thermodynamics, thermodynamic state and state functions, enthalpy, steady-state, steady-flowprocess, equilibrium, phase rule, reversible process, constant -V and constant – P process, heat capacity. Laws of thermodynamics, Calculation of Work, energy and property changes in reversible processes. The PVT behavior of pure substances, virial equations, ideal gas, applications of the virial equations.

UNIT - II

THERMODYNAMICS OF FLOW PROCESSES AND HEAT ENGINES: Principles of conservation of mass and energy for flow systems, analysis of expansion processes. Statements of the second law, heat engines, thermodynamic temperatures scales, Entropy, Entropy changes of an ideal gas, third law of thermodynamics, entropy from microscopic viewpoint.

UNIT - III

THERMODYNAMIC PROPERTIES OF FLUIDS AND SOLUTION THERMODYNAMICS: Estimation of thermodynamic properties using equations of state; Maxwell relationships and their applications; Calculation of flow processes based on actual property changes Partial molar properties; concepts of chemical potential and fugacity, Ideal & non ideal solutions; Gibbs Duhem equation; Excess properties of mixtures;Activity Coefficient.

UNIT - IV

HEAT TRANSFER BY CONDUCTION: Fourier's law, thermal conductivity, steady state conduction in plane wall & composite walls, compound resistances in series, heat flow through a cylinder, conduction in spheres, Typical heat exchange equipment, countercurrent and parallel current flows, energy balances, rate of heat transfer, overall heat transfer coefficient, logarithmicmean temperature difference, and individual heat transfer coefficients, fouling factors.

UNIT - V

HEAT EXCHANGE EQUIPMENT: General design of heat exchange equipment, heat exchangers, condensers, boilers and calendrias, extended surface equipment, heat transfer in agitated vessels, scraped surface heat exchangers, heat transfer in packed beds.

TEXT BOOKS :

17FT018 CANCER BIOLOGY AND THERAPY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course deals with the understanding of physiological and molecular behaviour of cancer cells. The main intention of this course is to acquaint students with the biological principles of cancer in human beings and its therapies. In addition, current concepts in cancer biology and cancer genetics will be introduced to students.

Course Outcomes:

Upon successful completion of this course, the student will be able to understand about

- *Fundamentals of cancer biology*
- *Tumor suppressor genes and oncogenes*
- *Different forms of cancer*
- *Principles of physical and chemical carcinogenesis; molecular cell biology of cancer and metastasis*
- *Screening and detection of cancer; and different cancer therapeutic approaches*

SKILLS:

✓ *Handling animal cells, CO_2 incubator*

✓ *Culturing cancer cell lines*

✓ *Passaging and trypsinization of cells*

✓ *Identification of cancer cells based on physical appearance*

✓ *Basic HE staining to differentiate cancer cells*

ACTIVITIES:

- Preparation of cell culture specific media
- Calculation and preparation of buffers
- Maintaining aseptic conditions of Laminar Flow chamber
- Inducing cancer in animal models
- Evaluation of anti-cancer activities of medicinal plants

UNIT - I

FUNDAMENTALS OF CANCER BIOLOGY: Regulation of cell cycle, mutations that cause changes in signal molecules, signal switches, tumour suppressor genes, modulation of cell cycle in cancer, different forms of cancers, diet and cancer. Cancer screening, early and advanced detection, Detection using biochemical assays, tumor markers, molecular tools for early diagnosis of cancer.

UNIT - II

PRINCIPLES OF CARCINOGENESIS: Theory of carcinogenesis, Chemical carcinogenesis, metabolism of carcinogenesis, principles of physical carcinogenesis, x-ray radiation-mechanisms of radiation carcinogenesis.

UNIT - III

PRINCIPLES OF MOLECULAR CELL BIOLOGY OF CANCER: Signal targets and cancer, activation of kinases; Oncogenes, identification of oncogenes, retroviruses and oncogenes, Oncogenes/proto oncogene activity. Growth factors related to transformation. Role of Telomerases in cancer.

UNIT - IV

PRINCIPLES OF CANCER METASTASIS: Clinical significances of invasion, metastatic cascade, basement membrane disruption, three step theory of invasion, proteinases and tumour cell invasion.

UNIT - V

NEW MOLECULES FOR CANCER THERAPY: Different forms of therapy-chemotherapy, radiation therapy, Gene therapy and immunotherapy. Use of signal targets towards therapy of cancer.

17CS001 Advanced Database Management Systems

L	T	P	C
3	-	3	5

Course Description and Objectives:

This course presents in depth, databases and database management systems. Topics covered will include: the fundamental nature for how data is stored on electro-magnetic devices, database management system architecture, building complex database objects, establishing and maintaining database security and tuning databases for optimum performance. Provides the theory and practice of advanced database development and administration.

Course Outcomes

The student will be able to:

- ✓ Understand the basic concepts of relational data model, entity-relationship model, relational database design, relational algebra and SQL.
- ✓ Design Entity Relationship(ER) models to represent simple database application scenarios.
- ✓ Design and implement advanced queries using Structured Query Language
- ✓ Understand the Distributed database concepts
- ✓ Identify, describe, and categorize database objects.
- ✓ Understand the basic concepts of Mongo DB
- ✓ Explore non-relational database systems and structures

Skills

- ✓ Design a conceptual database using ER-Model.
- ✓ Convert ER- Model to RDBMS.
- ✓ Design and implement advanced queries using Structured Query Language
- ✓ Perform the database tuning
- ✓ Identify, describe, and categorize database objects.

UNIT - I

Conceptual database Design: Relational Model, Relational Algebra, Relational Calculus, ER Model, ER-Diagram, Normalization and SQL

UNIT - II

Physical database Design: Overview of Storage and Indexing, Physical Database design and Tuning

Unit III

Distributed Database Systems: Evolution of Distributed Database System, Distributed Database- Concepts, Design and Transaction Management

UNIT - IV

Object-Oriented Database Design: Introduction, Object-oriented Data Model, Object Databases Standards and Definitions.

UNIT - V

Bigdata: Introduction to MongoDB, The data Model, Installing MongoDB, Working with MongoDB.

Activities

- ✓ Design of ER diagram for the development of web applications
- ✓ Transformation of ER diagram into a relational schema.
- ✓ Creation of relations with entity and referential integrity constraints for a given relational schema
- ✓ Performing the database tuning techniques
- ✓ Creating complex database objects
- ✓ Installation of mongo DB
- ✓ Working with No SQL

Laboratory Experiments

List of Programs

1. Web application Database Design using ER Design tool (ex. ERDPlus, SmartDraw,TOAD)
2. Data Definition, Table Creation, Constraints, Insert, Select Commands, Update and Delete Commands.
3. Basic SQL Queries
4. Complex Queries and Join Queries
5. Views
6. Design and development of database using MYSQL
7. High level programming language extensions (Control structures, Procedures and Functions).
8. Triggers
9. Familiarization of MongoDB
10. Installation of MongoDB
11. Working on MongoDB using NoSQL
12. Case Study/ Database application project.

Text Books :

17CS003 DATA STRUCTURES AND ALGORITHMS

L	T	P	C
3	-	3	5

Course description and objectives:

This course introduces students to the analysis and design of computer algorithms. The course is intended to provide the foundations of the practical implementation and usage of Algorithms and Data Structures. One objective is to ensure that the student evolves into a competent programmer capable of designing and analysing implementations of algorithms and data structures for different kinds of problems. The second objective is to expose the student to the algorithm analysis techniques, to the theory of reductions, and to the classification of problems into complexity classes like NP.

Course Outcomes:

Upon completion of this course, students will be able to do the following:

- ✓ Analyze the asymptotic performance of algorithms.
- ✓ Demonstrate a familiarity with major algorithms and data structures.
- ✓ Apply important algorithmic design paradigms and methods of analysis.
- ✓ Synthesize efficient algorithms in common engineering design situations.

SKILLS:

- ✓ Be able to Design and Analyse programming problem statements.
- ✓ Choose appropriate data structures and algorithms, understand the ADT/libraries, and use it to design algorithms for a specific problem.
- ✓ Be able to understand the necessary mathematical abstraction to solve problems.
- ✓ Be able to come up with analysis of efficiency and proofs of correctness
- ✓ To be able to comprehend and select algorithm design approaches in a problem specific manner.

Unit – I

Elementary Data Structures: Trees, binary heaps, Hashing, Balanced Search Trees - Properties and Abstract Data Types (ADT) of AVL, Red-Black and Splay Trees, Disjoint set data structure: Union-find

Unit – II

Introduction to Algorithm Analysis: Algorithm, Asymptotic Notation Recurrences: Substitution, Iteration and master method

Divide and Conquer: General method, Applications - Binary search, Merge sort, Quick sort, Strassen’s Matrix multiplication

Unit – III

Greedy Method: General method, Applications - Fractional knapsack problem, Minimum cost spanning trees, Single source shortest path problem

Graph Algorithms: BFS, Applications of BFS, bipartite graphs, Depth First Search(DFS), Application Of DFS like Topological Sort, Cycle Detection, Checking Whether a Digraph is Strongly connected or not,

Unit – IV

Dynamic Programming: General method, Applications - Matrix chain multiplication, Optimal binary search trees, 0/1 knapsack problem, All pairs shortest path problem, Travelling sales person problem and design, Longest Common Subsequence.

Unit – V

Backtracking: General method, Applications - N-queen problem, Sum of subsets problem
Intractability and NP-Completeness: The class NP, Satisfiability, NP-hard and NP-complete problems, proving a problem is NP-complete. Approximation algorithms for NP-hard problems

LABORATORY EXPERIMENTS

1. Implement stack ADT and write a program that reads an infix arithmetic expression of variables, constants, operators (+, -, *, /) and converts it into the corresponding postfix form. Extend the program to handle parenthesized expression also.
2. Write a program to implement the following operations:
   a) Traversal operation on a given binary search tree with given elements.
   b) Search for a key element in the above binary search tree.
   c) Delete an element from the above binary search tree.
3. Write a program to sort a given list of elements using quick sort and merge sort
4. Implement AVL Tree ADT and write a program that interactively allows
   a) Insertion b) Deletion c) Find_min d) Find_max
5. Consider the problem of eight queens on an (8x8) chessboard. Two queens are said to attack each other if they are on the same row, column, or diagonal. Write a C++ program that implements backtracking algorithm to solve the problem i.e. place eight non-attacking queens on the board.
6. Write a C++ program to implement dynamic programming algorithm to solve all pairs shortest path problem.
7. Write a C++ program to solve fractional 0/1 knapsack problem.
8. Write a C++ program to find the strongly connected components in a digraph.
9. Write a C++ program that uses dynamic programming algorithm to solve the optimal binary search tree problem.
10. Write a C++ program to solve traveling sales person problem.
11. Write a C++ program to find optimal ordering of matrix multiplication. (Note: Use Dynamic programming method).

Activities
1. Prepare a table for each sorting algorithm showing the elapsed system time (use standard clock function) of the sort for *at least* four different non-trivial array sizes. A non-trivial array size is one where the runtime is more than just a few milliseconds.
2. Design an array based data structure for two stacks called a DualStack The two stacks should share the same array in an efficient manner. If there are MaxSize entries in the array then the IsFull function should only return true is all the entries in the array are occupied. Your operations should all be constant time. Check such a nice data structure would be possible for 3 stacks or not
3. Design an algorithm based on depth-first search to determine if a graph is bipartite and if it is not return an odd length cycle in the graph. You algorithm should use the adjacency list representation of a graph. Your algorithm should run in linear time. Hint: there are two labels for marking 1 and 2. A new vertex visited from a vertex marked 1 is marked 2 and a new vertex visited from a vertex marked 2 is marked 1.
4. Some project planning applications use a labeled acyclic directed graphs to represent the jobs and job times on a project. A vertex in the graph represents a job and its label represents the time the job will take. A directed edge from one vertex to another represents the fact the job represented by the first vertex must be completed before the job represented by the second vertex. Assume we have a directed acyclic graph G =({1,2,...,n},E) with vertices labeled by non-negative integers c_1, c_2, ... ,c_n . The label

c_i represents the time job i will take. Assume futher that every vertex is reachable by some path from vertex 1, vertex 1 has in-degree 0, vertex n is reachable by some path from every vertex, and n has out degree 0. Vertex 1 represent the beginning of the project and vertex n represent the end of the project. The length of a path from 1 to n is the sum of the labels on the vertices along the path. Design an algorithm based on the topological sort algorithm to find the length of a longest path from 1 to n in the graph. The length of the longest path represents how long the entire project will take. Sometimes a longest path is called a critical path.

5. Design a Data Structure for web server to store history of visited pages. The server must maintain data for last n days. It must show the most visited pages of the current day first and then the most visited pages of next day and so on.
6. In biological applications, we often want to compare the DNA of two (or more) different organisms. A strand of DNA consists of a string of molecules called bases, where the possible bases are adenine, guanine, cytosine, and thymine. Representing each of these bases by their initial letters, a strand of DNA can be expressed as a string over the finite set A, C, G, T. One goal of comparing two strands of DNA is to determine how "similar" the two strands are, as some measure of how closely related the two organisms are. Similarity can be and is defined in many different ways. One way to measure the similarity of strands S1 and S2 is by finding a third strand S3 in which the bases in S3 appear in each of S1 and S2; these bases must appear in the same order, but not necessarily consecutively. The longer the strand S3 we can find, the more similar S1 and S2. Compute the similarity between ACCGGTCGAGTGCGCGGAAGCCGGCCGAA and GTCGTTCGGAATGCCGTTGCTCTGTAAA using dynamic programming approach.
7. Determine which of the following problems are NP-complete and which are solvable in polynomial time. In each problem you are given an undirected graph G = (V, E), along with:
   (a) A set of nodes $L \subseteq V$, and you must find a spanning tree such that its set of leaves includes the set L.
   (b) A set of nodes $L \subseteq V$, and you must find a spanning tree such that its set of leaves is precisely the set L.
   (c) A set of nodes $L \subseteq V$, and you must find a spanning tree such that its set of leaves is included in the set L.

17CS003 EMBEDDED SYSTEMS

L	T	P	C
3	1	-	4

Course Description and Objectives:
This course emphasizes on comprehensive treatment of embedded hardware and real time operating systems along with case studies, in tune with the requirements of Industry. The objective of this course is to enable the students to understand embedded-system programming and apply that knowledge to design and develop embedded solutions.

Course Outcomes:
The student will be able to:
- ✓ Understand the concept of embedded system, microcontroller, different components of microcontroller and their interactions.
- ✓ Get familiarized with programming environment to develop embedded solutions.
- ✓ Program ARM microcontroller to perform various tasks.
- ✓ Understand the key concepts of embedded systems such as I/O, timers, interrupts and interaction with peripheral devices.

Activities:
- ✓ Identify hardware and software components to build an embedded system.
- ✓ Demonstrate the interfacing of peripherals with 8051/ARM microcontroller.
- ✓ Porting of OS on to ARM processor board.
- ✓ Demonstrate Deadlock situation in RTOS.
- ✓ Demonstrate Inter-task communication methods in RTOS.

Skills:
- ✓ Programming the ARM processors.
- ✓ Design of microcontroller based embedded system.
- ✓ Interfacing of various peripherals with ARM processors.
- ✓ Expertise in writing multiple tasks under RTOS environment.
- ✓ To handle shared data issues in RTOS environment

Unit - I
Introduction to Embedded Systems: Definition, Applications of ES, Embedded Hardware Units and Devices, Embedded Software, Design Metrics in ES, Challenges in ES Design.

Unit- II
Architecture of 8051: 8051 Micro controller Hardware, Input/output Ports and Circuits, External Memory, Counter and Timers, Serial data Input/output, Interrupts and Programming 8051.

UNIT –III
ARM- Embedded Processor: History, Architecture, Interrupt vector, Programming the ARM, ARM Assembly language, Instruction set, Conditional Execution, Arithmetic and Logical Compare.

UNIT – IV
ARM PROGRAMMING: Assembly programming, General structure of assembly language, Writing programs, Branch instructions, Loading constrains, load and store instructions, Read-only and read/write Memory, Multiple Register Load and Store.

UNIT – V

REAL TIME OPERATING SYSTEMS: Introduction, Tasks and Task States, Tasks and Data, Reentrancy, Semaphores and Shared Data, Inter Process Communication-Message Queues, Mailboxes and Pipes.

TEXT BOOKS:

1. Raj Kamal, "Embedded Systems", 2nd edition, Tata McGraw Hill, 2009.
2. Lyla B Das, "Embedded Systems an Integrated Approach", 1st edition, Pearson, 2012.

17CS005 CLOUD COMPUTING

L	T	P	C
3	1	-	4

Course Description and Objective:
This course gives an introduction to cloud computing and its techniques, issues, and its' services that will lead to design and development of a simple cloud service.

Course Outcomes:
Upon Completion of the course, the students will be able to
- ✓ Compare the strengths and limitations of cloud computing
- ✓ Identify the architecture, infrastructure and delivery models of cloud computing
- ✓ Apply suitable virtualization concept.
- ✓ Choose the appropriate Programming Models and approach.
- ✓ Address the core issues of cloud computing such as security, privacy and interoperability
- ✓ Design Cloud Services

Skills:
- ✓ Gain broad perceptive of cloud architecture and models
- ✓ Understand the concept of Virtualization and implements it.
- ✓ Understand the features of cloud simulator and simulate cloud environment
- ✓ Apply different cloud programming models.
- ✓ Learn and Design the trusted cloud computing system.

Activities:
- ✓ Identify various network devices in laboratory.
- ✓ Investigate various network topologies.
- ✓ Connect various workstations in Ethernet.
- ✓ Simulate the data link protocols.
- ✓ Design of detecting and correcting errors in data transmission.
- ✓ Identify the different classes of IP addresses.
- ✓ Study on functionalities of routers.
- ✓ Simulate routing algorithms.

UNIT I
Cloud History and Fundamentals: Cloud computing at a Glance, Historical Developments, Building cloud computing environments, Computing platforms and technologies, Cloud architecture, types of clouds, Economics of the cloud.

UNIT II
Virtualization: Basics of Virtualization - Types of Virtualization - Implementation Levels of Virtualization - Virtualization Structures - Tools and Mechanisms - Virtualization of CPU, Memory, I/O Devices - Virtual Clusters and Resource management – Virtualization for Data-center Automation.

UNIT III
Cloud Services and File System: Types of Cloud services: Software as a Service - Platform as a Service –Infrastructure as a Service - Database as a Service - Monitoring as a Service –

Communication as services. Service providers: Google App Engine, Amazon EC2, Microsoft Azure, Sales force. Introduction to Map Reduce, GFS, HDFS, Hadoop Framework.

UNIT IV

Programming Model: Parallel and Distributed Programming Paradigms – Map Reduce, Twister and Iterative MapReduce – Hadoop Library from Apache – Mapping Applications - Programming Support - Google App Engine, Amazon AWS - Cloud Software Environments - Eucalyptus, Open Nebula, OpenStack, Aneka, CloudSim

UNIT V

Security in the Cloud: Security Overview – Cloud Security Challenges and Risks – Software-as-a-Service Security – Security Governance – Risk Management – Security Monitoring – Security Architecture Design – Data Security – Application Security – Virtual Machine Security - Identity Management and Access Control – Autonomic Security.

Text Books:

	17CS004	Cryptography and Network Security
	17CS006	Internet of Things
	17CS008	Big Data Analytics

17CS002 DATAWAREHOUSING & DATAMINING

L	T	P	C
3	-	3	5

Course Description and Objectives:

This course is aimed at offering data and information management, information retrieval, and knowledge discovery in modern organizations. Case studies of those organizations using technologies to support business intelligence gathering and decision making are explored. This course is designed to understand the issues relating to the feasibility, usefulness, effectiveness, and scalability of techniques used for the discovery of patterns hidden in large data sets and also characterizes the kind of patterns that can be discovered by association rule mining, classification and clustering

Course Outcomes:

Students are able to

- ✓ Learn the basic concepts of Database Technology Evaluation steps and also understood the need of data mining and its functionalities
- ✓ Explore the efficient and effective maintenance of Data Warehouses.
- ✓ Apply the data mining functionalities like Clustering, Classification, Association Analysis to real world data.
- ✓ Discover interesting patterns and association rules from huge volume of data used to do classifications and predictions.
- ✓ Gain knowledge on developing areas like Web Mining, Text Mining, and Spatial Mining.

Skills:

- ✓ Design and development of schema models for a data warehouse
- ✓ Extraction of hidden interesting association rules
- ✓ Implementation of various classification and clustering algorithms
- ✓ Extraction of knowledge from text databases

UNIT- I

Introduction: Why Data Mining, What is Data Mining, Kinds of Data, Kinds of Patterns, and Technologies used, Kinds of applications adopted, Major issues in Data Mining.

Data Warehousing and Online Analytical Processing: Basic Concepts, Data Warehouse Modeling, Data Warehouse Design and Usage, Data Warehouse Implementation, Data Generalization by Attribute-Oriented Induction

UNIT– II

About Data: Data Objects and Attribute Types, Basic Statistical Descriptions of Data, Data Visualization, Measuring Data Similarity and Dissimilarity

Data Preprocessing: An Overview, Data Cleaning, Data Integration, Data Reduction, Data Transformation and Data Discretization

UNIT- III

Data Cube Technology: Preliminary Concepts, Data Cube Computation Methods, Processing Advanced Kinds of Queries by Exploring Cube Technology, Multidimensional Data Analysis in Cube Space

Mining Frequent Patterns, Associations, and Correlations: Basic Concepts and Methods: Basic Concepts, Frequent Itemset Mining Methods, Which Patterns Are Interesting?—Pattern Evaluation Methods

Advanced Pattern Mining: Pattern Mining in Multilevel, Multidimensional Space, Constraint-Based Frequent Pattern Mining.

UNIT- IV
Classification: Basic Concepts, Decision Tree Induction, Bayes Classification Methods, Rule-Based Classification, Model Evaluation and Selection, Techniques to Improve Classification Accuracy
Advanced Classification: Bayesian Belief Networks, Classification by Back propagation, Support Vector Machines, Classification Using Frequent Patterns, Lazy Learners, Other Classification Methods

UNIT- V
Cluster Analysis: Cluster Analysis, Partitioning Methods, Hierarchical Methods, Density-Based Methods, Grid-Based Methods, Evaluation of Clustering
Advanced Cluster Analysis: Probabilistic Model-Based Clustering, Clustering High-Dimensional Data

LABORATORY EXPERIMENTS

Course Outcomes:
Students can able

- ✓ To evaluate the different models of OLAP and data preprocessing.
- ✓ To enlist various algorithms used in information analysis of Data Mining Techniques.
- ✓ To demonstrate the knowledge retrieved through solving problems

.**List of Experiments**

1. Explore various commands given in PL/SQL in Oracle 8.0
2. Execute multi-dimensional data model using SQL queries.
3. Implement various OLAP operations such as slice, dice, roll up, drill up, pivot etc.
4. Implementation of Text Mining on the data warehouse
5. Explore the correlation-ship analysis between the data set
6. Evaluate attribute relevance analysis on a weather data warehouse
7. Evaluate Information Gain of an attribute in the student database
8. Experiment to predict the class using the Bayesian classification
9. Find out a weight & bias updating using the Back Propagation Neural Network
10. To perform various data mining algorithms on the give data base using WEKA

TEXT BOOKS:

17CS004 CRYPTOGRAPHY AND NETWORK SECURITY

L	T	P	C
3	-	3	5

Course Description and Objective:
This course focuses on offering the knowledge of applying cryptographic algorithms for network security. It also deals with the understanding and controlling of malicious software like viruses and worms. The objective of this course is to enable the student to understand and apply various security algorithms in applications such as e-mail, web and other data transfer mechanisms.

Course Outcomes
The student will be able to:

- ✓ Understand and implement different types of conventional and modern cryptographic algorithms.
- ✓ Apply various encryption techniques for network security.
- ✓ Develop programs involving symmetric and asymmetric ciphers.
- ✓ Familiarize with web security and transport level security protocols.

Skills:

- ✓ Identify and resolve different types of security vulnerabilities.
- ✓ Differentiate classical encryption methods with modern encryption algorithms.
- ✓ Develop secured client/server environment.
- ✓ Apply different security mechanisms for different layers.
- ✓ Compare and evaluate different encryption algorithms.

Activities:

- ✓ Design and implementation of a network.
- ✓ Build secured applications using sockets and TCP/IP.
- ✓ Manage security In small business network applications.
- ✓ Application of S/MIME, PGP in e-mail security.

UNIT - I
Introduction: Security Trends, Security attacks, Security services, Security Mechanisms, A Model for Network Security Model, Classical Encryption Techniques, Symmetric Cipher Model, Substitution Techniques, Transposition Techniques, Rotor Machines, Steganography.

UNIT - II
Block Ciphers and Data Encryption Standard: Block Cipher Principles, Data Encryption Standard, Strength of DES, Differential and Linear Cryptanalysis, Block Cipher Design Principles, Advanced Encryption Standard, Evaluation Criteria of AES,AES Cipher, Multiple encryption and Triple DES, Block Cipher Modes of Operation, RC4. Cast-128, Blowfish Algorithms

UNIT - III
Public - Key Encryption and Hash Functions: Principles of Public Key Cryptosystems, RSA Algorithm, Key Management ,Message Authentication and Hash Functions, Authentication Requirements, Authentication Functions, Message Authentication, Hash

Functions, Security of Hash Functions and MACs, Digital. Signatures, Authentication Protocols, Digital Signature Standard.

UNIT - IV

Network Security Applications: Kerberos, X.509Authentication Service, Public Key Infrastructure, Pretty Good Privacy, S/MIME , IP Security Overview, IP Security architecture, Authentication Header, Encapsulating Security Payload, Combining Security associations, Key Management.

UNIT - V

System Security: Secure Socket Layer and Transport Layer Security, Secure Electronic Transaction, Intruders, Intrusion Detection, Password Management, Malicious Software, Firewalls, Trusted Systems.

LIST OF EXPERIMENTS

List of Programs

1. Implement substitution and transposition ciphers.
2. Develop simplified data encryption standard algorithm (S-DES).
3. Write a program to implement RSA algorithm.
4. Demonstrate the usage of wireshark to identify abnormal activity in network communication.
5. Demonstrate usage of NMAP (Zenmap) tool in network scanning.
6. Demo of eavesdropping attack and its prevention using SSH.
7. Configuration and deployment of firewall.

Text Books

1. Cryptography and Network security by William Stallings, Pearson Education, 4th ed.,

Reference Books

1. William Stallings, “Network Security Essentials Applications and Standards”, 2nd ed., Pearson Education, 2003.

3. Cyrus Piekari, Anton Chuvakin, “Security Warrior”, 2nd ed., Oreilly, 2005.
4. Peborab Russell, G.T. Gangeni Sr, “Computer Security Basics”, 2nd ed., Oreilly Publishers, 2006.

17CS006 INTERNET OF THINGS

L	T	P	C
3	1	-	4

Course description and objectives:
Students will be explored to the concepts and applications of Internet of Things, interconnection and integration of the physical world and the cyberspace. They are also able to design & develop IOT Devices and applications.

Course Outcomes:
- ✓ Able to understand the application areas of IOT
- ✓ Able to realize the revolution of Internet in Mobile Devices, Cloud & Sensor Networks
- ✓ Able to understand building blocks of Internet of Things and characteristics.
- ✓ Learn Programing concepts using python
- ✓ Able to develop programs in python
- ✓ Able to design and develop IoT applications

Skills:
- ✓ Learn how IoT works in different domain applications by case studies.
- ✓ Learn Python programming language
- ✓ Learn how to sense or actuate devices using Raspberri Pi kits
- ✓ Learn how to create a successful product using IoT

Unit I
Introduction & Concepts: Introduction to Internet of Things, Physical Design of IOT, Logical Design of IOT, IOT Enabling Technologies, IOT Levels.

Unit II
Domain Specific IOTs: Home Automation, Cities, Environment, Energy, Retail, Logistics, Agriculture, Industry, Health & Life Style.

Unit III
Installing Python, Python Data Types & Data Structures, Control Flow, Functions, Modules, Packages, File Handling, Date/ Time Operations, Classes, Python Packages

Unit IV
M2M & System Management with NETCONF-YANG: M2M, Difference between IOTand M2M, SDN and NFV for IOT, Software defined Networking, Network Function Virtualization, Need for IOT Systems Management, Simple Network Management Protocol, Limitations of SNMP, Network Operator Requirements, NETCONF, YANG.

Unit V
IOT Design Methodology, Case study using weather monitoring.IOT Physical Devices & Endpoints: What is an IOT Device, Exemplary Device, Board, Linux on Raspberry Pi, Interfaces, and Programming of IOT Devices.

TEXT BOOKS:

1. Vijay Madisetti, ArshdeepBahga," Internet of Things A Hands-On- Approach", 2014, ISBN:978 0996025515

1. 1.Adrian McEwen, “Designing the Internet of Things”, Wiley Publishers, 2013, ISBN: 978-1-118-43062-0
2. 2.DanielKellmereit, “The Silent Intelligence: The Internet of Things”. 2013, ISBN 0989973700

Activities

- ✓ Python programming with IDLE
- ✓ Program to sense or actuate devices in simulation environment
- ✓ Awarness how to use Raspberri Pi kits for development of IoT

17CS008 BIG DATA ANALYTICS

L	T	P	C
3	-	3	5

Course Description and Objectives:
This course gives an overview of Big Data, i.e. storage, retrieval and processing of big data. The focus will be on the "technologies", i.e., the tools/ algorithms that are available for storage, processing of Big Data and a variety of "analytics".

Course Outcome:
The student will be able to:
- Understand the theoretical issues involved in Big Data system design such as the curse of dimensionality.
- Familiarize with major approaches in Big Data Analytics.

Skills:
Upon completion of this course, students will be able to do the following:
- Students will to build and maintain reliable, scalable, distributed systems with Apache Hadoop.
- Students will be able to write Map-Reduce based Applications
- Students will be able to design and build applications using Hive and Pig based Big data Applications
- Students will learn tips and tricks for Big Data use cases and solutions

Activities:
- Install Hadoop and develop applications on Hadoop
- Develop Map Reduce applications
- Develop applications using Hive/Pig/Spark

Unit-I
Introduction to big data: Data, Characteristics of data and Types of digital data:, Sources of data, Working with unstructured data, Evolution and Definition of big data, Characteristics and Need of big data, Challenges of big data
Big data analytics: Overview of business intelligence, Data science and Analytics, Meaning and Characteristics of big data analytics, Need of big data analytics, Classification of analytics, Challenges to big data analytics, Importance of big data analytics, Basic terminologies in big data environment

Unit-II
Introduction to Hadoop : Introducing Hadoop, need of Hadoop, limitations of RDBMS, RDBMS versus Hadoop, Distributed Computing Challenges, History of Hadoop , Hadoop Overview, Use Case of Hadoop, Hadoop Distributors, HDFS (Hadoop Distributed File System) , Processing Data with Hadoop, Managing Resources and Applications with Hadoop YARN (Yet another Resource Negotiator), Interacting with Hadoop Ecosystem

Unit-III
Introduction to MAPREDUCE Programming: Introduction , Mapper, Reducer, Combiner, Partitioner , Searching, Sorting , Compression, Real time applications using MapReduce, Data serialization and Working with common serialization formats, Big data serialization formats

Unit-IV

Introduction to Hive: Introduction to Hive, Hive Architecture , Hive Data Types, Hive File Format, Hive Query Language (HQL), User-Defined Function (UDF) in Hive.

Introduction to Pig: Introduction to Pig, The Anatomy of Pig, Pig on Hadoop, Pig Philosophy, Use Case for Pig: ETL Processing, Pig Latin Overview, Data Types in Pig, Running Pig, Execution Modes of Pig, HDFS Commands, Relational Operators, Piggy Bank, Word Count Example using Pig , Pig at Yahoo!, Pig versus Hive

Unit-V

Spark: Introduction to data analytics with Spark, Programming with RDDS, Working with key/value pairs, advanced spark programming

Text Books

1. Big Data Analytics, Seema Acharya, Subhashini Chellappan, Wiley
2. Learning Spark: Lightning-Fast Big Data Analysis, Holden Karau, Andy Konwinski, Patrick Wendell, Matei Zaharia, O'Reilly Media, Inc.

Reference Books:

1. Boris lublinsky, Kevin t. Smith, Alexey Yakubovich, "Professional Hadoop Solutions", Wiley, ISBN: 9788126551071, 2015.
2. Chris Eaton, Dirk derooset al. , "Understanding Big data ", McGraw Hill, 2012.
3. Tom White, "HADOOP: The definitive Guide", O Reilly 2012.
4. Vignesh Prajapati, "Big Data Analytics with R and Hadoop", Packet Publishing 2013.

LABORATORY EXPERIMENTS

Getting Hadoop Up and Running in a cluster:

1. Setting up Hadoop on standalone machine.
2. Wordcount Map Reduce program using standalone Hadoop.
3. Adding the combiner step to the Wordcount Map Reduce program.
4. Using HDFS monitoring UI
5. HDFS basic command-line file operations.
6. Setting Hadoop in a distributed cluster environment.
7. Running the WordCount program in a distributed cluster environment.
8. Practice on Map Reduce monitoring User Interface
9. Sort operation using MapReduce
10. Simple analytics using Map Reduce.
11. Creation of Database using hive.
12. Practice of Hive Query Language operations.
13. Basic operations in pig
14. Implementation of Word count using Pig.
15. Simple programs using Spark.
16. Implementation of WordCount using Spark

Text Books

1. Hadoop Map Reduce Cookbook, Srinath Perera & Thilina Gunarathne, 2013, PACKT PUBLISHING.
2. Learning Spark: Lightning – Fast Big Data Analysis, Holden Karau, Andy Konwinski, Patrick Wendell, MateiZaharia O'Reilly Media, Inc.
3. Tom White " Hadoop The Definitive Guide" O'Reilly 2012

17CS009 Wireless Computer Networks

L	T	P	C
3	1	-	4

Course Description and Objective:

This course covers major aspects of ad hoc networks, from design through performance issue to application requirements. The objective of the course is to enable the student to use MAC protocols and routing protocols in wireless ad hoc networks.

Course Outcomes:

The student will be able to:

- ✓ Understand the principles of mobile ad hoc networks (MANET)
- ✓ Understand the function and applications of routing protocols.
- ✓ Simulate the routing protocols using NS2.

Skills:

- ✓ Design and simulate an ad hoc network for real-time applications.
- ✓ Develop routing algorithms using NS2.
- ✓ Simulate MAC scheduling algorithms using NS2.
- ✓ Simulate applications for specific QoS parameters.

Activities:

- ✓ Design a MANET with different number of nodes.
- ✓ Design and develop a routing algorithm for a specified ad hoc network.
- ✓ Design a scheduling algorithm for energy saving for a specified ad hoc network.
- ✓ Design an adhoc network for the given application

Unit-I

Introduction: Mobile Communications and computing : Mobile Computing (MC)-Introduction to MC, novel applications, limitations, and architecture GSM – Mobile services , System Architecture , Radio interface, Protocols , Localization and calling , Handover, Security, and new data services.

Unit-II

Wireless Medium Access Control: Motivation for a specialized MAC, SDMA, FDMA, TDMA , CDMA. Mobile Network layer – Mobile IP: Goals , assumptions, entities and terminology, IP packet delivery, agent advertisement and discovery , registration, tunneling and encapsulation, optimizations), Dynamic Host configuration Protocol (DHCP) . Mobile transport layer – traditional TCP, Indirect TCP, Snooping TCP, Mobile TCP, Fast retransmit/ fast recovery, Transmission / timeout freezing , Selective retransmission, Transaction oriented TCP.

Unit-III

Mobile Ad Hoc Networks(MANET) : Overview, Properties of a MANET, spectrum of MANET applications, routing and various routing algorithms, Security in MANET protocols

Unit-IV

Wireless Application Protocol – WAP: Introduction, protocol architecture, and treatment of protocols of all layers, Bluetooth: User scenarios, physical layer, MAC layer, networking, security, link management.

Unit-V

Routing Protocols: Design issues, Goals and classification. Table driven routing protocols, On-demand routing protocols, Hybrid routing protocols, Hierarchical routing protocols and Power aware routing protocols.

Textbooks:

1. Jochen Schiller, Mobile Communications, Addison-Wesley, Second edition, 2008.
2. C.Siva Ram Murthy and B.S.Manoj, “Adhoc Wireless Networks Architectures and Protocols”, Pearson Education, 2nd edition, 2007.

Reference Books:

1. William Stallings, “Wireless Communications and Networks”, Prentice Hall of India / Pearson Education, 2nd edition, 2007.
2. Uwe Hansmann, Lothar Merk, Martin S Nicklons and Thomas Stober, “Principles of Mobile Computing”, Springer International, 2nd edition, 2007.
3. Raj Kamal, “Mobile Computing”, Oxford University Press, 2nd edition, 2007.
4. Dharma P Agarwal and Carlos Cordeiro, “Adhoc and Sensor Networks - Theory and Applications”, World Scientific Publications, 1st edition, 2007.

17C010 ARTIFICIAL INTELLIGENCE

L	T	P	C
3	1	-	4

Course Description and Objectives:
To familiarize students with Artificial Intelligence techniques for building well engineered and efficient intelligent systems. Pattern-directed inference systems and different types of truth maintenance systems will be discussed in length from both theoretical and applied point of view. Some cutting edge applications of these systems will also be discussed. Introduction to Artificial Intelligence Programming using Prolog will be provided to help students with the programming part of the course.

Course Outcomes:
Upon completion of this course, student should able to :

- ✓ Understand the basic concepts of search techniques in intelligent systems and game playing.
- ✓ Represent facts in propositional and first order logic and deduct the new sentence from old sentences.
- ✓ Formulate the planning problem as search problems and construct planning graph.
- ✓ Understand the concept of rule based system(expert system) and importance of knowledge in decision support systems.
- ✓ Understand the different types of learning concepts and construct the decision tree

Skills

- ✓ Apply the search techniques and gaming concepts
- ✓ Explore the facts and apply the inference mechanism
- ✓ Formulate the planning problem as search problem
- ✓ Understand the concepts of expert systems.
- ✓ Solving the different types of learning.

UNIT – I
Artificial Intelligence Introduction: Artificial Intelligence Agents, Problem Solving, Solving Problems by searching, informed Search Methods, Game Playing.

UNIT - II
Knowledge and reasoning: Agents that Reason Logically, First Order Logic, Building a Knowledge Base.

UNIT - III
Logical Reasoning Systems: Acting Logically, Practical planning. Planning and Acting.

UNIT - IV
Uncertain knowledge and reasoning: Uncertainty, Probabilistic Reasoning System, Making Simple Decisions

UNIT - V
Learning: Learning from Observations, Learning in Neural and Belief Networks, Reinforcement learning, Knowledge in Learning.

TEXT BOOKS :

1. Stuart J. Russell and Peter Norvig, “Artificial Intelligence A Modern Approach” Second Edition, Pearson Education.

REFERENCE BOOKS:

1. Jeff Heaton, “Artificial Intelligence for Humans”, Volume 1:
2. Ivan Bratko , “Fundamental Algorithms by Prolog Programming for Artificial Intelligence”, 4th Edition, AddisonWesley, 2011
3. Saroj Kaushik, “Logic And Prolog Programming”, first edition, 2002

Activities

- ✓ Solve the 8 puzzle Problem-using A* algorithm in Prolog.
- ✓ Write a program in prolog to solve Tower of Hanoi by using AO* algorithm
- ✓ Write a program to develop TIC-TAC-TOE game.
- ✓ Write a program using variables in Prolog. Write a Prolog program containing facts related to following predicates
  - Location (city, state)
  - Stays (person, city)
  - Display: (i) list of person, state and city (ii) Given person staying in which state.
- ✓ Write a program to implement Sussman Anomaly problem, In the problem, three blocks (labeled A, B, and C) rest on a table. The agent must stack the blocks such that A is atop B, which in turn is atop C. However, it may only move one block at a time.
- ✓ Write Prolog program of water jug problem.
  - Given a 4 - liter jug filled with water & an empty 3 - liter Jug, how can one obtain exactly 2 liters in 4 liters jug. There is no measuring mark on any of them.
- ✓ 7. Write a program to implement Missionaries and Cannibals problem.
  - There are three missionaries and three cannibals on the left bank of a river. They wish to cross over to the right bank using a boat that can only carry two at a time. The number of cannibals on either bank must never exceed the number of missionaries on the same bank, otherwise the missionaries will become the cannibals' dinner! Plan a sequence of crossings that will take everyone safely across.

17CS011 ADVANCED COMPUTER ARCHITECTURE

L	T	P	C
3	1	-	4

Course Description and objectives:
The objective of this course is to learn the fundamental aspects of parallel computer architecture with an emphasis on system design and analysis. The course focuses on processor design trends - instruction pipeline concepts, out-of-order execution, dynamic hardware scheduling, advanced branch prediction techniques, multiple issue superscalar processors, Multiprocessors and Multi computers.

Course Outcomes:
The student will be able to analysis issues related to advanced computer architectures:

- ✓ Understand the micro-architectural design of the processor
- ✓ Foundations of high speed computation
- ✓ Pipelining
- ✓ Data and resource dependencies
- ✓ Hazards and exceptions

Skills:

- ✓ Analysis on performance of computing using different architectures
- ✓ Know about the different architectures.
- ✓ Familiarity with pipelining concepts.
- ✓ Know how the control transfer based on the instructions.
- ✓ Case studies on MIMD architectures

UNIT - I

Introduction to parallel processing: Basic concepts, Types and Levels of parallelism, Classification of parallel architectures, Basic parallel techniques.

Introduction to IPL-processors: Evolution and overview of ILP processors, Dependencies between instructions, Instruction scheduling, Preserving sequential consistency.

UNIT - II

Pipelined processors: Basic concepts, Design space of pipelines, Overview of pipelined instruction processing, Pipelined execution of Integer and Boolean Instructions.

VLIW Architectures: Basic principles, Overview of proposed and commercial VLIW architectures.

Superscalar Processors: Introduction, Parallel decoding, Superscalar instruction issue, Shelving- The design space, Scope of shelving, Layout of the shelving buffers, Operand fetch policies, Instruction dispatch schemes

UNIT- III

Processing of Control Transfer Instructions: Introduction, Types of branches, How architectures check the results of operations, The branch problems, Performance measures of branch processing, Basic approaches to branch handling, Delayed branching,

Branch processing- The design space, Branch detection, Overview of Branch processing policies, Branch prediction schemes, Accessing the branch target path

UNIT - IV

Introduction to Data-parallel Architectures: Introduction, Connectivity, Alternative architectural classes.

SIMD architectures: Introduction, Design space-Granularity, Connectivity, Processor Complexity, Local autonomy

MIMD architectures: Architectural concepts, Problems of Scalable computers, Main design issues of scalable MIMD computers

UNIT -5

Distributed memory MIMD Architectures: Introduction, Design Space, Direct interconnection networks, Interconnection Topologies, Switching techniques, Routing

Shared Memory MIMD Architectures: Introduction, Dynamic interconnection networks, Shared path networks, Switching networks, Cache coherence problems, Hardware based protocols, Software based protocols.

Activities :

- ✓ Outline the design of a computer system to meet a performance requirement
- ✓ Evaluate performance of different architecture with respect to various parameters.
- ✓ Analyze performance of different ILP techniques.
- ✓ Identify cache and memory related issues in multi-processors.

TEXT BOOK:

17CS012 ARTIFICIAL NEURAL NETWORKS

L	T	P	C
3	1	-	4

Course description and objectives:
On completion of this course the students will be able to expose themselves towards intelligence systems and knowledge based systems. It also provides knowledge of learning networks.

Course Outcomes:
Students can able to
- ✓ Understand the difference between biological neuron and artificial neuron
- ✓ Understand the application areas of neural networks
- ✓ Understand building blocks of Neural Networks.
- ✓ Develop neural network models
- ✓ Design and develop applications using neural networks.

Skills:
- ✓ Learn to design and build neural network models
- ✓ Learn to develop learning algorithms for machine learning

UNIT -I
Introduction to Artificial Neural Networks : Introduction, Artificial Neural Networks, Historical Development of Neural Networks, Biological Neural Networks, Comparison Between them and the Computer, Comparison Between Artificial and Biological Neural Network Basic Building Blocks of Artificial Neural Networks, Artificial Neural Network (ANN) terminologies.

UNIT - II
Fundamental Models of Artificial Neural Networks : Introduction, McCulloch - Pitts Neuron Model, Learning Rules, Hebbian Learning Rule Perceptron Learning Rule, Delta Learning Rule (Widrow-Hoff Rule or Least Mean Square(LMS)Rule,Competitive Learning Rule, Out Star Learning, Boltzmann Based Learning, Hebb Net.
Perceptron Networks : Introduction, Single Layer Perceptron, Brief Introduction to Multilayer Perceptron Networks.

UNIT - III
Adaline and Madaline Networks: Introduction, Adaline, Madaline.
Associative Memory Networks: Introduction, Algorithms for Pattern Association, Hetero Associative Memory Neural Networks, Auto Associative Memory Network, Bi- directional Associative Memory.

UNIT – IV
Feedback Networks: Introduction, Discrete Hopfiled Net, Continuous Hopfiled Net, Relation between BAM and Hopfiled Nets.
Feed Forward Networks: Introduction, Back Propagation Network (BPN), Radial Basis Function Network (RBFN).

UNIT – V
Self Organizing Feature Map : Introduction, Methods Used for Determining the Winner, Kohonen Self Organizing Feature Maps, Learning Vector Quantization (LVQ),Max Net, Maxican Hat, Hamming Net

Adaptive Resonance Theory : Introduction, ART Fundamentals, ART 1, ART2

TEXT BOOKS:

17CS013 BIOMETRICS

L	T	P	C
3	1	-	4

Course Description and Objectives:

Biometrics has emerged as a specialized field in criminal forensics, public safety surveillance, user authentication and identification. Expansion of biometric modalities are ranged from fingerprint, face and other traits to multimodal biometric traits. Objectives of this course include scientific foundations needed for the design, implementation, and evaluation of large scale biometric identification systems.

Course Outcomes:

The Student will be able to

- ✓ Understand the technological uplifts with biometrics compared to traditional securing mechanisms.
- ✓ Gain knowledge in building blocks of research fields like Pattern Recognition, Image Processing and Machine Learning etc.
- ✓ Evaluate and Design security systems with biometrics.

Activities:

- ✓ Hands-on training to acquisited biometric data using different sensors
- ✓ Designing and development of different identification/ verification systems to validate the user identity
- ✓ Simulation of a multimodal biometric recognition system to know the challenges of Uni-modal system.

Skills:

- ✓ Design and develop a biometric security system
- ✓ Explore the challenges and limitations of Uni-modal biometric systems
- ✓ Solve the Identification/ Verification problems
- ✓ Explore different fusion scenarios at Information-level, fusion-level etc.,

Unit 1: Introduction

Person Recognition, Biometric Systems, Biometric Functionalities, Biometric System Errors, The Design Cycle of Biometric Systems, Applications, Security and Privacy issues.

Unit II: Fingerprint Recognition

Introduction, Friction Ridge Pattern, Fingerprint Acquisition, Feature Extraction, Fingerprint Matching, Fingerprint Indexing, Synthesis

Unit III: Face Recognition

Introduction, Acquisition, Face Detection, Feature Extraction and Matching, Advanced Topics

Unit IV: Iris Recognition

Introduction, Design of an Iris Recognition System, Image Acquisition, Iris Segmentation, Iris Normalization, Iris Encoding and Matching, Iris quality and performance evaluation.

Unit V: Multimodal Biometrics

Introduction, Sources of Multiple Evidence, Acquisition and Processing Architecture, Fusion levels.

17CS014 COMPUTER VISION

L	T	P	C
3	1	-	4

Course description and objectives:

To introduce the fundamentals of image formation; Linear filtering methods, Edge detection and Segmentation based on Color and Texture and to provide the student with programming experience from implementing computer vision and object recognition applications in MATLAB.

Course Outcomes:

The Student will be able to:

- ✓ Understand the basic concepts of Camera and Projection system.
- ✓ Describe known techniques of Filters and edge detection Techniques.
- ✓ Understand the various Segmentation Techniques based on Color, Texture.
- ✓ Understand the design of a computer vision system for a specific problem learn how to apply their theoretical knowledge in practice.

Skills:

- ✓ Learn about various linear filters.
- ✓ Analyze various Edge detection Methods
- ✓ Analyze the various Segmentation techniques for specific applications.
- ✓ Study and implement of various Computer Vision Case studies

Activities:

- ✓ Design the smoothing filter with a Gaussian function.
- ✓ Implement using the Laplacian to detect edges.
- ✓ Design &Implement shot boundary detection.
- ✓ Implement segmentation using simple clustering methods.
- ✓ Implementation of the EM algorithm .
- ✓ Implement the linear filter response to additive Gaussian noise
- ✓ Implement the inverse Fourier transforms.

Unit – I

IMAGE FORAMTION AND IMAGE MODELS: CAMERA-pinhole cameras, camera with lenses, the human eye, sensing, geometric camera models-elements of analytical Euclidean geometry, camera parameters and the perspective projection, affine cameras and affine projection equations, color-human color perception, representing color, a model for image color.

Unit – II

FILTERING TECHNIQUES: linear filters-Linear Filters and Convolution, Shift Invariant Linear Systems, Spatial Frequency and Fourier Transforms, Sampling and Aliasing, Filters as templates, technique: normalized correlation and finding patterns, technique: scale and image pyramids.

Unit – III

EDGE DETECTION and TEXTURE: Noise- estimating derivatives, detecting edges, Texture-representing texture, analysis using oriented pyramids, application, shape from texture.

Unit – IV

SEGMENTATION: Segmentation by clustering-what is segmentation, human vision, applications, image segmentation by clustering pixels, segmentation by graph, segmentation by fitting a model-Hough transforms, missing data problems fitting and segmentation, the EM algorithm in practice.

Unit – V

APPLICATIONS: finding in digital libraries-organizing collection of information, summary representations of the whole picture, representing parts of picture, image based rendering-3d models from image sequences, transfer based approaches, the light filed

17CS015 CYBER SECURITY

L	T	P	C
3	-	3	5

Course Description and Objective

This course focuses on cyber threats and cyber security, providing much needed awareness in the times of growing cybercrime. The objective of this course is to bring awareness to the student through simple practical tips and enable the student to understand and avoid becoming victims of cyber crime.

Course Outcomes

The student will be able to:

- ✓ Have an overview of cyber crime scenario and legal perspective on cyber crime.
- ✓ Understand different types of cyber attacks.
- ✓ Understand about tools and methods used in cyber crime.
- ✓ Understand the need of cyber laws.
- ✓ Understand and know how cyber forensics is used in cyber crime investigations.

Skills

- ✓ Identify different classification of cyber crimes.
- ✓ Performing cyber forensics.
- ✓ Know about vulnerabilities and scanning them.
- ✓ Usage of firewalls.

Activities

- ✓ To get information about computer systems on a network and the services running its open ports.
- ✓ Perform port scanning, transferring files, and port listening
- ✓ Sniffing router traffic.
- ✓ Using tools and methods of cyber crime.

UNIT - I

Introduction to cybercrime and cyber offences: Cybercrime definition and origins of the word, Cybercrime and information security, Classifications of cybercrime, Cybercrime and the Indian ITA 2000, A global Perspective on cybercrimes. How criminal plan the attacks, Social Engg, Cyber stalking, Cybercafe and Cybercrimes, Botnets, Attack vector, Cloud computing

UNIT - II

Tools and Methods Used in Cybercrime: Proxy Servers and Anonymizers, Phishing, Password Cracking, Keyloggers and Spywares, Virus and Worms, Steganography, DoS DDoS Attacks, SQL Injection, Buffer Over Flow, Attacks on Wireless Networks, Phishing, Identity Theft (ID Theft)

UNIT - III

Cybercrimes and Cyber Security: The Legal Perspectives, Need of Cyberlaw: The Indian Context, The Indian IT Act, Digital Signature and the Indian IT Act, Amendments to the Indian IT Act, Cybercrime and Punishment, Cyberlaw, Technology and Students: Indian Scenario

UNIT - IV

Understanding Computer Forensics: Historical Background of Cyber forensics, Digital Forensics Science, The Need for Computer Forensics, Cyber forensics and Digital Evidence, Forensics Analysis of Email, Digital Forensics Lifecycle, Chain of Custody Concept, Network Forensics, Approaching a Computer Forensics Investigation, Computer Forensics and Steganography, Relevance of the OSI 7 Layer Model to the Computer Forensics and Social Networking Sites: The Security/Privacy Threats, Forensics Auditing, Anti Forensics.

UNIT - V

Cyber Security: Organizational Implications, Cost of Cybercrimes and IPR Issues:Lesson for Organizations, Web Treats for Organizations: The Evils and Perils, Security and Privacy Implications from Cloud Computing, Social Media Marketing:Security Risk and Perils for Organization, Social Computing and the Associated Challenges for Organizations, Protecting People's Privacy in the Organization, Organizational Guidelines for Internet Usage, Safe Computing Guidelines and Computer Usage Policy, Incident Handling

LABORATORY EXPERIMENTS

List of programs

1. TCP scanning using NMAP
2. Port scanning using NMAP
3. TCP / UDP connectivity using Netcat
4. Perform an experiment to demonstrate sniffing of router traffic by using the tool wireshark.
5. Perform an experiment how to use dumpsec.
6. Perform an experiment to sniff traffic using ARP Poisoning
7. mplementing the Secure Sockets Layer (SSL v2/v3) and Transport Layer Security (TLS v1) network protocols
8. Setup a honey pot and monitor the honey pot on network.

TEXT BOOKS

1. Cyber Security Understanding Cyber Crimes, Computer Forensics and Legal Perspectives by Nina Godbole and Sunit Belpure, Publication Wiley

REFERENCE BOOKS

1. Anti-Hacker Tool Kit (Indian Edition) by Mike Shema, Publication Mc Graw Hill.
2. Nina Godbole, *Information Systems Security,* Wiley India, New Delhi

17CS016 FUNDAMENTALS OF IMAGE PROCESSING

L	T	P	C
3	1	-	4

Course description and objectives:
To introduce the fundamentals of image processing at Low Level and Mid-Level; and it covers Spatial and Frequency domain image enhancement, Edge detection, Segmentation, image compression and morphological image processing. And to provide the student with programming experience from enhance the image and object recognition applications in MATLAB.

Course Outcomes:
The Student will be able to:
- ✓ Understand the basic concepts of Image Acquisition system.
- ✓ Describe known techniques of enhancement of image using spatial and frequency domain.
- ✓ Understand the various Segmentation methods based on discontinuity and similarity of pixels.
- ✓ Understand the design of a image compressor system.

Skills:
- ✓ Learn about various enhancement techniques using GIMP and MATLAB
- ✓ Analyze both smoothing and sharpening filters.
- ✓ Analyze the various Segmentation techniques for specific applications.
- ✓ Understand the application of various morphological operations.
- ✓ Study and implement of various Image Compressor systems.

Activities:
- ✓ Design the smoothing filter with average or weighted average template.
- ✓ Implement using the Laplacian operator to detect thin edges.
- ✓ Design &Implementation of edge based segmentation for Building images
- ✓ Design & Implementation of region based segmentation for Medical images
- ✓ Design and Implementation of Loss-Less Image Compression System .

Unit – 1
Fundamentals of Image Processing: Fundamental steps in digital image processing, components of image processing system. A simple image formation model, image sampling and quantization, basic relationships between pixels. Basic geometric transformations-Introduction to Fourier Transform and DFT – Properties of 2D Fourier Transform – FFT – Separable Image Transforms-Walsh – Hadamard – Discrete Cosine Transform.

UNIT – II
Image enhancement in the spatial and frequency domains : Basic gray-level transformation, histogram processing, enhancement using arithmetic and logic operators, basic spatial filtering, smoothing and sharpening spatial filters, combining the spatial enhancement methods, Frequency domain filters, homomorphic filtering. Image Restoration: Degradation Models, PSF, circulant and block - circulant matrices, DE convolution, restoration using inverse filtering.

UNIT – III
Image Segmentation : Segmentation and Edge detection region operations, basic edge detection, second order detection, crack edge detection, gradient operators, compass and

Laplace operators, edge linking and boundary detection, thresholding, region based segmentation, segmentation by morphological watersheds, color segmentation.

UNIT – IV

Image Compression: Fundamentals, image compression models, error-free compression, lossy predictive coding, image compression standards. Morphological Image Processing: Preliminaries, dilation, erosion, open and closing, hit or miss transformation, basic morphologic algorithms**.**

UNIT – V

Representation and Description: Chain codes, Polygonal approximation, Signature Boundary Segments, Skeletons, Boundary Descriptors, Regional Descriptors, Relational Descriptors, Principal components for Description, Relational Descriptors

TEXT BOOKS:

1. Digital Image Processing, Rafeal C Gonzalez, Richard E.Woods, Third Edition, Pearson Education/PHI.

REFERENCE BOOKS:

1. Image Processing, Analysis, and Machine Vision, Milan Sonka, Vaclav Hlavac and Roger Boyle, Second Edition, Thomson Learning.
2. Introduction to Digital Image Processing with Matlab, Alasdair McAndrew, Thomson Course Technology
3. Computer Vision and Image Processing, Adrian Low, Second Edition, B.S.Publications
4. Digital Image Processing using Matlab, RafealC.Gonzalez, Richard E.Woods, Steven L. Eddins, Pearson Education.
5. Digital Image Processing, William K. Prat, Wily Third Edition
6. Digital Image Processing and Analysis, B. Chanda, D. Datta Majumder, Prentice Hall of India, 2003.

17CS017 PATTERN RECOGNITION

L	T	P	C
3	1	-	4

Course Description and Objectives:

This course deals with automated classification, identification, and/or characterization of unknown systems. The objective of the course is to enable the student to understand driven field, identification of pathological disorders from various biological indicators, hand written character recognition, finger print analysis, face recognition, iris scan based recognition and financial data predictions.

Course Outcomes:

The student will be able to:

- ✓ Understand the theoretical issues involved in pattern recognition system design such as the curse of dimensionality.
- ✓ Familiarize with major approaches in statistical and syntactic pattern recognition.
- ✓ Implement pattern recognition techniques.
- ✓ Design and develop a pattern recognition system.

Skills:

- ✓ Partition data objects by using different classification techniques.
- ✓ Group the data objects by applying different clustering techniques.
- ✓ Identify the data objects by using different feature selection approaches.
- ✓ Reduce the data objects by applying dimensionality reduction techniques.

Activities:

- ✓ Students are able to do different Estimation Techniques in real time applications\
- ✓ Students are able to apply different classification techniques
- ✓ Students are able to apply different dimensionality reduction techniques

UNIT - I

Introduction and Mathematical Preliminaries: What is pattern recognition?, Clustering vs. Classification, Applications, Linear Algebra, Vector spaces, Probability theory, Estimation techniques.

UNIT - II

Bayes Decision Theory: Discriminant Functions and Services, the Normal Distribution, Bayesian Classification, Estimating Probability Density Functions, Nearest Neighbor Rules, Bayesian Networks, Linear Classifiers: the Perceptron Algorithm, Least-Squares Methods

UNIT - III

Nonlinear Classifiers: Multilayer Perceptron's, Back Propagation Algorithm, Decision Trees, Combinations of Classifiers, Boosting.

Clustering: Sequential Algorithms, Hierarchical Algorithms, Functional Optimization-Based Clustering, Graph Clustering, Learning Clustering, Clustering High Dimensional Data: Subspace Clustering

UNIT - IV

Feature Selection: Data Preprocessing, ROC Curves, Class Separability Measures, Feature Subset Selection, Bayesian Information Criterion

UNIT - V

Dimensionality Reduction: Basis Vectors, Singular Value Decomposition, Independent Component Analysis, Kernel PCA, Wavelets

Additional Features And Template Matching: Texture, Shape and Size Characterization, Fractals, Features For Audio, Template Matching Using Dynamic Time Warping and Edit Distance

TEXT BOOKS :

1. S Theodoridis and K Koutroumbas, “Pattern Recognition”, 4th edition, Academic Press, 2009.
2. K Fukunaga, “Statistical pattern Recognition”, 1st edition, Academic Press, 2000.

5. Koller D and Friedman N, “Probabilistic Graphical Models”, 1st edition, MIT Press, 2009.
6. R O Duda, P E Hart and D G Stork, “Pattern Classification”, 1st edition, John Wiley, 2001.

17CS018 WEB TECHNOLOGIES

L	T	P	C
3	-	3	5

Objective:

Students will be explored to standard design and development of web based solutions using multi-tier architecture. They should have good understanding of different technologies on client and server side components.

Course Outcomes:

- ✓ Students are able to design very good front end using HTML, CSS, JavaScript, AJAX.
- ✓ Students are able to develop applications on struts and hibernate frameworks.
- ✓ Students are able to develop applications to interact with database using connection pooling.

Skills:

- ✓ Learn MVC standard development of applications.
- ✓ Learn working with Integrated Development Environment.
- ✓ Learn internationalization concepts.
- ✓ Learn web services concepts.

Activities:

- ✓ Ask the students to install the following software if not installed and work with configuration files to identify port number and integration.
  - i. JDK current version
  - ii. apache tomcat server
  - iii. MYSQL/Oracle software
  - iv. Eclipse/My Eclipse/Net beans ID's Add struts, hibernate JARS
- ✓ Develop a university website and deploy in free hosting server.
- ✓ Develop a personnel website and host in free hosting server.
- ✓ Develop 2 applications one is bus ticket booking another one is for service provider and provide communication between these using web services.

UNIT I

Client Side Technologies: Overview of HTML - Common tags, XHTML, capabilities of HTML5, Cascading Style sheets, CSS3 enhancements, linking to HTML Pages, Classes in CSS, Introduction to JavaScripts, variables, arrays, methods and string manipulation, BOM/DOM (Browser/Document Object Model), accessing elements by ID, Objects in JavaScript, Dynamic HTML with JavaScript and with CSS, form validation with JavaScript, Handling Timer Events Simplifying scripting with JQuery, JASON for Information exchange.

UNIT II

Introduction to Java Servlets: Introduction to Servlets, Lifecycle of a Servlet, Reading request and initialization parameters, Writing output to response, MIME types in response, Session Tracking: Using Cookies and Sessions, Steps involved in Deploying an application, Database Access with JDBC and Connection Pooling. Introduction to XML, XML Parsing with DOM and SAX Parsers in Java, Ajax - Ajax programming with JSP/Servlets, creating XML Http Object for various browsers, Sending request, Processing response data and displaying it, Introduction to Hibernate.

UNIT III
Introduction to JSP: JSP Application Development: Types of JSP Constructs (Directives, Declarations, Expressions, Code Snippets), Generating Dynamic Content, Exception Handling, Implicit JSP Objects, Conditional Processing, Sharing Data Between JSP pages, Sharing Session and Application Data, Using user defined classes with jsp:useBean tag, Accessing a Database from a JSP

UNIT IV
Introduction to Struts Framework: Introduction to MVC architecture, Anatomy of a simple struts2 application, struts configuration file, Presentation layer with JSP, JSP bean, html and logic tag libraries, Struts Controller class, Using form data in Actions, Page Forwarding, validation frame work, Internationalization.

UNIT V
Service Oriented Architecture and Web Services: Overview of Service Oriented Architecture – SOA concepts, Key Service Characteristics, Technical Benefits of a SOA, **Introduction to Web Services–** The definition of web services, basic operational model of web services, basic steps of implementing web services.
Core fundamentals of SOAP – SOAP Message Structure, SOAP encoding, SOAP message exchange models, Describing Web Services –Web Services life cycle, anatomy of WSDL, Introduction to Axis– Installing axis web service framework, deploying a java web service on axis. Web Services Interoperability – Creating java and .Net client applications for an Axis Web Service.

LABORATORY EXPERIMENTS

List of Programs

1. Write a HTML page including user name: text box, password: Password box, age: text box, mail id: text box. Write a java script to validate HTML page user name: should not be empty password: 1. should not be empty 2. should have one upper case letter 3. one lower case letter 4. one special character 5. one integer. Age: should be between 0 to 99. mail should be valid mail. If all the details are true then display valid user else display corresponding error message.
2. Write an HTML page. That contains a selection box with a list of 5 countries. When the user selects a country its states should be printed in the next list. Use the AJAX properties.
3. Create an XML document that contains 10 users information. Write a java program, which takes user Id as input and returns the user details by taking the user information from the XML document using a)DOM parser and b)SAX parser.
4. Implement the following web applications using struts and hibernate
   i. A user validation web application, where the user submits the login name and password to the server. The name and password are checked against the data available in database and if the data matches, a successful login page is returned. Otherwise a failure message is shown to the user.
   ii. Modify the above program use XML instead of database.
5. A web application takes a name as input and on submit it shows a hello <name> at the top right corner of the page and provides a logout button. On clicking this button, it should show a logout page with thank you <name> message with the duration of usage (hint: use session to store name and time)

6. Develop a library management system using struts and hibernate.
7. Develop a student attendance monitoring system using struts and hibernate.
8. Develop an e-commerce application.

17CS019 Wireless Communication Networks

L	T	P	C
3	1	-	4

Course Description and Objective:

The course addresses the fundamentals of wireless communications and provides an overview of existing and emerging wireless communications networks. It covers radio propagation and fading models, fundamentals of cellular communications, multiple access technologies, and various wireless networks, including past and future generation networks. Simulation of wireless systems under different channel environments will be integral part of this course.

The objective of the course is to introduce the students to the fundamentals of wireless communications and the evolution of wireless networks from the first generation to LTE and LTE advanced.

Course Outcome:

The student will be able to:

- ✓ Understand the basic concept of wireless system design and get familiar with various wireless networks
- ✓ Understand the new trends in mobile/wireless communications networks.
- ✓ Understand multiple radio access techniques.
- ✓ Analyze various routing algorithms used in mobile/wireless networks.
- ✓ Identify the issues in transport and application layers.

Skills:

- ✓ Identify and simulate the medium access control mechanisms suitable for given applications.
- ✓ Develop ad-hoc network applications using appropriate algorithms/protocols.
- ✓ Identify the impact of improvements made to TCP in mobile/wireless networks.
- ✓ Identify the need of mobile IP and simulating mobile IP network.

Activities

- ✓ Choose medium access control mechanism for a given application.
- ✓ Distinguish among various wireless networks.
- ✓ Simulate the calling mechanism used in GSM.
- ✓ Design and simulate a simple wireless network.
- ✓ Analyze the customization of TCP in wireless network.

Unit-I

Overview of Wireless Communications and Systems: Review of digital communications, Cellular systems from 1G to 3G Wireless 4G systems, Radio propagation and propagation path-loss model, Free-space attenuation, Multipath channel characteristics, Signal fading statistics, Path-loss models.

Unit-II

Fundamentals of Cellular Communications: Hexagonal cell geometry, Co-channel interference, Cellular system design, Sectoring using directional antennas.

Unit-III

Multiple Access Techniques: Frequency division multiple access (FDMA), Time division multiple access (TDMA), Code division multiple access (CDMA), Space division multiple access (SDMA), Orthogonal frequency division multiplexing (OFDM), Multicarrier CDMA (MC-CDMA), Random access methods.

Unit-IV
Wide-area Wireless Networks (WANs): GSM – IS-136 IS-95, UMTS Cdma2000, Long Term Evolution Technologies (LTE), and OFDM MIMO channels, Space Time Codes LTE Advanced.

Unit-V
Other Wireless systems: IEEE 802.11, WLAN (WiFi) WiMAX

Textbook:
1. Mischa Schwartz, "Mobile Wireless Communications," Cambridge University Press, Paperback, 2013, ISBN: 9781107412712.

I YEAR	**COURSE CONTENTS FOR COMMON COURSES**	
II SEMESTER	17HS001	Research Methods
	17HS002	Employment Orientation Program (EOP)

17HS001 Research Methods

L	T	P	C
3	-	-	3

Objective of the Course:
Objective of the course is to enable research scholars to have a general understanding of research methods and application of statistical tools in the analysis and interpretation of findings and guidelines for report writing.

UNIT - I
Introduction: Nature and Importance of research, the role of business research, aims of social research, research process, types of research. Data Base: discussion on primary data and secondary data, probability and non-probability sampling techniques.

UNIT-II
Research design: Meaning of research design. Functions and goals of research design. Questionnaire and Schedule.

UNIT – III
Measurement and scaling concepts: Attitude measurement, levels of measurement and types of scales, criteria for good measurement. Measures of central tendency, measures of dispersion, measures of variation, Correlation and Regression. Statistical Inference. Tests of significance for small samples, t-test, Chi-Square test and ANOVA-one way and two way classifications. Discriminate analysis, cluster analysis, conjoint analysis

UNIT-IV
Technical Report Writing: Pre-writing considerations, Thesis writing, formats of report writing, Formats of publications in Research Journals. Technique of Interpretation, Precaution in Interpretation, Significance of Report writing, Different steps in writing Report, Layout of the Research Report, Types of Reports, Report Format, Typing Instructions, Oral Presentations.

UNIT-V
Research Ethics and Morals: Issues related to plagiarism, collaborative models and ethics, Acknowledgements. *Intellectual Property Rights:* copy rights.

17HS002 Employment Orientation Program

L	T	P	C
2	-	-	2

Preamble

It is common knowledge that students opting for the Masters Programme after B.Tech do so either because they have been unsuccessful in securing employment after their Bachelors or because they have not crystallized their career plan. Hence, students opting for M.Tech are found to be deficient not only in the technical knowledge but also in their communication skills and overall personality. There is a need to groom them and shape them into employable resources.

Program Objectives:

i. To impart employability skills to M.Tech. final students by honing their interpersonal and presentation skills.
ii. To equip them with the latest tools and techniques for effective communication through discussions, group work, presentation exercises, assignments, projects etc.
iii. To impart training for their overall personality development and shape them into confident, positive and ambitious professionals.

Course Contents

The course content, designed for 50 Hrs will comprise two modules:

- Communication skills & Overall personality improvement (10 * 2.5 = 25 Hrs)
- Pedagogy of Engineering Subjects & Making Project Presentations (10 * 2.5 = 25 Hrs)

Rationale for the Programme

On a more holistic view of higher education, the term “academic development” refers to development of multiple aspects of a student’s personality under this EOP for M.Tech students, different types of development are envisaged like personal, interpersonal skills, career development and life planning. “Development” in the engineering education according to national accreditation bodies like NBA and NAAC is understood to happen through activities and programmes designed to improve the ability to work to teams, express themselves confidently to their peers and present their views boldly before an audience and get things accomplished through management of men and materials. This programme will improve student’s overall communication skills and raise his/ her potential as an employee graduate.

About this Programme

The 50 Hrs course will be rolled out in two spells of 25 Hrs each with the help of in-house and invited experts. It is aimed at improving the presentation skills in general and teaching ability of the M.Tech students in particular. AFD will seek the cooperation of all the Deans, HoDs and senior professors as subject experts, mentors from the departments to provide the essential knowledge and skill inputs for the trainees so that the course outcomes can be realized.

Expected Outcomes:

Having gone through the 50 hrs rigorous training on presentation skills, pedagogy and overall personality grooming, the trainees will get equipped to face any interview confidently, make short and effective presentations during interviews and gain the confidence to handle engineering topics and perhaps also develop an aspiration for a career in teaching.

Assessment:

The trainees will be assessed for a total of 50 marks, which will be incorporated into the II year project marks. The summative assessment will be carried out by a special panel constituted for the purpose in consultation with the Dean, Evaluation and respective HoD.

- ✓ 5 Marks for attendance
- ✓ 5 Marks for formative assessment
- ✓ 40 Marks for summative assessment

Detailed Course Structure
I Year

Course Code	Course Title	L	T	P	C
I Semester					
17ES001	Microcontrollers for Embedded System	3	-	3	5
17ES003	Embedded System Design Concepts	3	1		4
17ES005	Embedded Programming	3	-	3	5
17ES007	Embedded Networking	3	1	-	4
II Semester					
17ES002	Ad-hoc Sensor Networks	3	-	3	5
17ES004	Design of IoT systems	3	-	3	5
17ES006	Embedded Linux	3	1	-	4
17ES008	Embedded System Design with FPGA	3	1		4
17HS001	Research Methods	2	-	-	2
17HS002	Employment Orientation Program	2	-	-	2
Pool of Electives					
17ES009	Introduction To Internet Of Things	3	1	-	4
17ES011	Soft Computing	3	1	-	4
17ES013	Adaptive Signal Processing	3	1	-	4
17ES015	System On Chip Design	3	1	-	4
17ES017	Digital Image And Video Processing	3	1	-	4
17ES019	Data Communications	3	1	-	4
17ES021	Neural Networks & Fuzzy Systems	3	1	-	4
17ES023	Scripting Languages(Common To Vlsi)	3	1	-	4
17ES010	Risc Processors Architecture And Programming	3	1	-	4
17ES012	Micro Electro Mechanical System	3	1	-	4
17ES014	Dsp Processors	3	1	-	4
17ES016	Computer Architecture And Parallel Processing	3	1	-	4
17ES018	Robotics And Automation	3	1	-	4
17ES020	Cryptography And Network Security	3	1	-	4
17ES022	Smart Instrumentation	3	1	-	4
17ES024	Wireless Communications And Networks	3	1	-	4

17ES001 MICROCONTROLLERS FOR EMBEDDED SYSTEMS

L	T	P	C
3	-	3	5

Objective of the Course:

This course is the Microcontrollers and Applications. The objective of this course is To study the fundamentals of Microcontrollers and design of embedded systems by using Microcontrollers.

Course Outcomes:

Understand the Architecture of Microcontrollers, Programming the Microcontrollers, Interfacing various real data collection sensors to Microcontrollers and design and developing a prototype embedded systems using Microcontrollers.

SKILLS ACQUIRED:

1. Design a 8051 microcontroller based embedded system.
2. To do case study experiences for microcontroller based Design synchronous and applications
3. Gain knowledge on ARM based system design.

ACTIVITIES:

1. Make some programs with 8051 and ARM

Unit-I

(overview of 8051) **L12**

8051 Microcontroller Architecture:

Architecture-memory organization -addressing modes- instruction set – Timers - Interrupts – I/O ports- serial communication. Arithmetic – logical - bit operations –time delays using Timers / Counters – Interrupts – serial Communication.

Unit-II **L12**

ARM Architecture & Programming:

ARM Design Philosophy, Registers, Program Status Register, Instruction Pipeline, Interrupt and Vector Table, ARM Processor Families. Instruction set: Data Processing Instructions, Addressing Modes, Branch, Load- Store instructions, PSR instructions, and Conditional instructions.

Unit-III **L12**

ARM Cortex-M3: Introduction- Background of ARM and ARM Architecture- Instruction Set Development- The Thumb-2 Technology and Instruction Set Architecture. - **Overview of the Cortex-M3:** Fundamentals – Registers - Operation Modes.

Unit-IV **L12**

ARM Thumb Instruction & Programming:

Thumb Instruction set: Register usage, Branch instructions, Data Processing Instructions, ingle-Register and Multi Register Load-Store instructions, stack, software Interrupt Instructions. Interrupts, Interrupt handling schemes.

Unit-V **L12**

Interfacing &Applications: Interfacing of LCD, Seven Segment display, keypad, stepper motor, DC motor. Generating pulses like PWM for motor control, Sensors (Temp, Pressure, Humidity, etc) interfacing and data acquisition using ADC/DAC. Developing simple applications by using Zigbee, Bluetooth, GPS and GPRS Modules (Any Two)

TEXTBOOKS:

1. Andrew N. SLOSS, Dominic SYMES, Chris WRIGHT "ARM System Developer's Guide: Designing and Optimizing System Software" Elsevier
2. Kenneth J Ayala " The 8051 Microcontroller Architecture, Programming and Applications", Delmar Cengage Learning; 3rd edition.
3. Muhammad Ali Mazidi, Janice Gillispie Mazidi, Rolin D.McKinlay "The 8051 Microcontroller and Embedded Systems: Using Assembly and C", Pearson.
4. Joseph Yiu , "The Definitive Guide to ARM® Cortex®-M3 and Cortex®-M4 Processors" 2014

REFERENCE BOOKS:

1. Myke Predko , "Programming and Customizing the 8051 Microcontroller" , McGraw Hill, 2000.
2. Steve Furber, "ARM System-on-Chip Architecture ", Second Edition, Pearson Education.
3. ARM Architecture Reference Manual.

MICROCONTROLLERS LAB

Course Learning Outcomes:

- To be able to learn about accessing various documents such as device manuals, board manuals, schematics etc.
- To be able to understand importance of C and assembly programming languages.
- To be able to understand about importance of various CPU architectures.

Note:

- At least 5 modules must interface with 8051 and 5 modules with ARM7.
- At least 10 experiments are to be carried out, at least 5 experiments must be coded in 'embedded c' and 5 in 'Assembly Language'.

List of Experiments (based on ARM cortex-M series)

1. Calculator type keyboard
2. 4-Digit,7-segment LED Display
3. Dual DAC
4. TXDR Interface Using PT100 with ADC
5. Stepper Motor
6. Elevator Interface
7. 4*4 Matrix Hex Keypad
8. Temp Sensor
9. 16 Channel 8-bit ADC
10. Logic Controller
11. Traffic Lights
12. Musical Tone Generator
13. Opto Isolated Input Interface
14. Opto Isolated Output Interface
15. DC Motor

17ES003 - EMBEDDED SYSTEM DESIGN CONCEPTS

L	T	P	C
3	1	-	4

Course Description and Objectives:

- To study the overview of Embedded System Architecture
- To focus on distributed Embedded Architecture and its accessing protocols
- To understand about the design methodologies in hardware and software design

Course Outcomes:
Upon successful completion of this course student should be able to:

- Explain various embedded system applications and design requirements
- Construct embedded system hardware
- Develop software programs to control embedded system
- Generate product specification for embedded system
- Outline validation and testing methodologies for embedded system

SKILLS ACQUIRED:

- Able to analyze design requirements.
- Able to design new hardware and software for different applications.
- Able to test and validate the different embedded system applications.

ACTIVITIES:

- Able to analyze design requirements.
- Able to design new hardware and software for different applications.
- Able to test and validate the different embedded system applications.

Unit – I **L-12**

An Introduction to Embedded Systems: An Embedded system, processor in the system, other hardware units, and software embedded into a system, Exemplary embedded systems, embedded system – on – chip (SOC) and in VLSI circuit. Processor and memory organization –Structural Units in a Processor, Processor selection for an embedded system, memory devices, memory selection for embedded systems, allocation of memory to program cache and memory management links, segments and blocks and memory map of a system, DMA, interfacing processors, memories and Input Output Devices.

Unit – II **L-12**
Embedded Design Life Cycle: Introduction, Product Specification, Hardware/ software partitioning, Iteration and Implementation, Detailed hardware and software design, Hardware/Software integration, Product Testing and Release, Maintaining and upgrading existing products.
Selection Process: Packaging the Silicon, Adequate Performance, RTOS Availability, Tool chain Availability, Other issues in the Selection process.
Partitioning Decision: Hardware/Software Duality, Hardware Trends, ASICs and Revision Costs.

Unit – III **L-12**

Development Environment: The Execution Environment, Memory Organization, System Startup.**Special Software Techniques:** Manipulating the Hardware, Interrupts and Interrupt service Routines (ISRs), Watchdog Times, Flash Memory, Design Methodology. **Basic Tool Set:** Host – Based Debugging, Remote Debuggers and Debug Kernels, ROM Emulator, Logic Analyzer. **Debugging Techniques:** Background Debug Mode (BDM), Joint Test Action Group (JTAG) and Nexus.

Unit - IV **L-12**

Testing: Why Test? When to Test? Which Test? When to Stop? Choosing Test cases, Testing Embedded Software, Performance Testing, Maintenance and Testing, The Future. **Writing Software for Embedded Systems:** The compilation Process, Native Versus Cross-Compilers, Runtime Libraries, Writing a Library, Using alternative Libraries, using a standard Library.

Unit-V **L-12**

Buffering and Other Data Structures: What is a buffer? Linear Buffers, Directional Buffers, Double Buffering, Buffer Exchange, Linked Lists, FIFOs, Circular Buffers, Buffer Under run and Overrun, Allocating Buffer Memory, Memory Leakage. Memory and Performance Trade-offs.

TEXTBOOKS:

1. Raj Kamal, "Embedded Systems Architecture Programming and Design", 2nd Edition Tata McGra-Hill.
2. Arnold S. Burger, "Embedded System Design – Introduction to Processes, Tools, Techniques", CMP Books.
3. Steve Heath, "Embedded Systems Design", 2nd Edition, Newnes.

REFERENCEBOOKS:

1. Butter worth Heinemann, Steve Heath; "Embedded systems design: Real world design", Newton mass, USA 2002.
2. David E. Simon, An embedded software primer, Addison Wesly-1999.

17ES005 Embedded Programming

L	T	P	C
3	-	3	5

Course Description and Objectives:

This course is an exploration of various programming techniques and constructs used to develop reliable software systems capable of responding in real time. An overview of the platforms, tools, and processes used in developing software for embedded systems will empower you to successfully create software which consumes less memory usage. This course is highly intended for designers who want to use C language to program microcontrollers

Course Outcomes:

Upon successful completion of this course, students should be able to:

a. Ability to do Embedded programming in C,
b. Ability to understand Embedded control and applications

SKILLS ACQUIRED:

1. Trace out the problems if any through testing.
2. Design fault tolerant systems.

ACTIVITIES:

1. Programming using C and C++ for different applications

Unit-I

Embedded Programming: C and Assembly - Programming Style - Declarations and Expressions - Arrays, Qualifiers and Reading Numbers - Decision and Control Statements - Programming Process - More Control Statements - Variable Scope and Functions - Advanced Types – Simple Pointers - In-line Assembly.

Unit-II **L12**

C Programming Toolchain in Linux: C Preprocessor - Stages of Compilation - Debugging and Optimization- Introduction to GCC - Debugging with GDB - The Make utility - Building and Using Libraries -Profiling using gprof-Memory Leak Detection with valgrind.

Unit-III **L12**

Real Time Operating Systems

Brief History of OS, Defining RTOS, The Scheduler, Objects, Services, Characteristics of RTOS, Defining a Task States, Scheduling, Task Operations, Structure, Synchronization, Communication and Concurrency, Defining Semaphores, Operations and Use, Defining Message Queue, States, Content, Storage, Operations and Use.

Unit-IV **L12**

Embedded C and Embedded OS

Adding Structure to 'C' Code: Object oriented programming with C, Header files for Project and Port, Examples. Meeting Real-time constraints: Creating hardware delays - Need for timeout mechanism - Creating loop timeouts - Creating hardware timeouts. Creating embedded operating system: Basis of a simple embedded OS, Introduction to sEOS, Using Timer 0 and Timer 1, Portability issue, Alternative system architecture, Important design considerations when using SEOS.

Unit-V **L12**

Memory Management

Dynamic memory allocation, Fixed size memory management, Blocking vs Non Blocking Memory functions, Hardware memory management units, synchronizing and communication. Case Studies of RTOS: VxWorks, Free RTOS.

TEXTBOOKS:

4. Jane W.S.Liu, Real Time Systems, Pearson Education.
5. Real Time Concepts for Embedded Systems – Qing Li, Elsevier, 2011

REFERENCEBOOKS:

1. Embedded /Real-Time Systems: concepts, Design and Programming—
   The Ultimate Reference, Prasad K.V.K.K, DREAMTECH PRESS, NEW DELHI
2. VxWorks Programmers Guide
3. VxWorks Reference Manual
4. Free RTOS Programmers Guide
5. Free RTOS Reference Manual

Embedded Programming Lab

Course Learning Outcomes:

- To be able to learn about various C Programming tools
- To be able to learn about Arduino in detail.

1. Introduction to C Programming tools
2. Using Standard I/O
3. Using Conditionals
4. Using Loops
5. Intro to Addresses, Pointers and Handles
6. Interfacing with Arduino
7. Arduino Digital Output
8. Arduino Digital Input
9. Arduino Analog Input
10. Arduino Reaction Timer
11. Arduino Reaction Timer Redux
12. Arduino Analog Output via PWM
13. Arduino Event Counter
14. Arduino Arbitrary Waveform Generator

17ES007 Embedded Networking

L	T	P	C
3	-	3	5

Course Description and Objectives:

This course is an exploration of Embedded Networking used to study and develop reliable communication protocols. An overview of the Embedded networking concepts is provided here. This course is highly intended for designers who want to use Ethernet, Can Protocols USB and other networking concepts

Course Outcomes:

Upon successful completion of this course, students should be able to:

a. Ability to work with CAN bus
b. Ability to understand and implement Firewalls and Protocols

SKILLS ACQUIRED:

1. Building a network using various components
2. Trace out the problems if any through testing.
3. Knowledge on various network Protocols.

ACTIVITIES:

1. RS232 based data transfer between two devices using cross connected cable and suitable application using C language or other
2. Data transfer using CAN protocol on a CAN bus
3. Modbus based data transfer along with application layer development for message interpretation
4. TCP/IP based data transfer with socket programming in C language or other
5. Implementation of a network address translator NAT
6. Implementation of a firewall

Unit-I

EMBEDDED COMMUNICATION BASICS

Introduction to Embedded Networking - Serial/Parallel Communication – Serial communication protocols -RS232 standard – RS422 - RS485 – Synchronous and Asynchronous Communication - Serial Peripheral Interface (SPI) – Inter Integrated Circuits (I2C) – PC Parallel port Interface -ISA/PCI Bus protocols

Unit-II **L12**

USB, CAN BUS and FRAMING

USB bus – Introduction – Speed Identification on the bus – USB States – USB bus communication: Packets –Data flow types –Enumeration –Descriptors – CAN Bus – Introduction – CAN Identifier, Deterministic Transmissions on CAN - Framing –Bit stuffing –Error Control Coding – Baseband Transmissions – RZ and NRZ methods

Unit-III **L12**

ETHERNET

Elements of a network – Bus and Star Topologies, CSMA/CD protocol, IEEE802.3 and versions of it, Inside Ethernet – Building a Network Hardware options – Cables, Connections and network speed – Ethernet Addressing, Hubs, switches and Bridges

Unit-IV **L12**

INTERNETWORKING

Internet Protocol IPv4, IP addressing, IPv6, Routing Concepts and Protocols, Distance Vector Routing, Link State Routing, Network Address Translator (NAT), Firewall.

Unit-V **L12**

TRANSPORT AND APPLICATION LAYER PROTOCOLS

TCP, UDP, DNS, HTTP, HTML Language, Cryptography concepts, Security Services and mechanisms, Symmetric cryptography and public key cryptography, DES, AES and RSA algorithms.

TEXTBOOKS:

1. Introduction to Data Communications and Networking- Wayne Tomasi, DeVry Institute Pearson 2005
2. Embedded Systems Design: A Unified Hardware/Software Introduction - Frank Vahid, Tony Givargis, John & Wiley Publications, 2002
3. Embedded Ethernet and Internet Complete - Jan Axelson, Penram publications, 2003
4. Computer Networks : A.Tanenbaum -5th Edition Prentice hall
5. Data and Computer Communications- William Stallings,9th edition. Prentice Hall, 2013.

17ES002 Ad hoc Sensor Networks

L	T	P	C
3		3	5

Course Description and Objectives:
The objective of this course is to study the fundamentals of Adhoc and Sensor Networks useful in data acquisition and IoT systems

Course Outcomes:
- Appreciate the importance of Adhoc and sensor networks for applications like environment monitoring, habitat monitoring, health care and data acquisition systems.
- Understanding of data transmission technologies of the Adhoc and sensor devices with focus on channel access routing and security.
- Appreciate the need and importance of converged networks, ubiquitous environment and 'Internet of things' in the context of Adhoc and sensor networks.
- Capable of model building ,new protocol design and strategies simulation of the systems that include the above.

SKILLS ACQUIRED:
1. Developing New Routing Protocols.
2. To do case study experiences for Adhoc sensor networks
3. Gain knowledge on Mica Motes.

ACTIVITIES:
1. Simulation of DSDV algorithm AODV algorithm and DSR algorithm along with the comparison with respect to the delay cost
2. Simulation of leach and Pegasis algorithm
3. Simulation of S-MAC algorithm
4. Simulation of SMac algorithm
5. Simulation of TEEN and APTEEN algorithms

Unit-I **L12**

Introduction to Adhoc Networks:
Overview and Communication aspects of Manet, Challenges, Topologies, Routing classification approaches, Proactive, Reactive, Position based and Other Routing Protocols

Unit-II **L12**

Broadcasting, Multicasting and Geocasting in Manets
Introduction, The Broadcast Storm - Broadcasting in a MANET, Flooding-Generated Broadcast Storm, Redundancy Analysis, Rebroadcasting Schemes, Multicasting - Issues in Providing Multicast in a MANET, Multicast Routing Protocols, Comparison, Geocasting - Geocast Routing Protocols, Comparison..

Unit-III **L12**

Wireless Sensor Network
Introduction, The Mica Mote, Sensing and Communication Range, Design Issues, Energy Consumption, Clustering of Sensors, Applications of Sensor Networks.

Unit-IV **L12**

Data Retrieval in Sensor Networks

Introduction, Classifications of WSNs, MAC layer Design issues and Protocols, Routing Protocols of Sensor Networks - Network Structure Based Routing, Flat versus Hierarchical Routing, Multipath and Query Based Routing, Location-Based Routing, Transport Layer, High-Level Application Layer Support, Adapting to the Dynamic Nature of WSNs.

Unit-V **L12**

Security and Connectivity to other Networks

Introduction, Security in Ad Hoc Networks, Distributed Systems Security, Key Management, Secure Routing, Cooperation in MANETs, Security of Wireless Sensor Networks, Intrusion Detection Systems, Ingredients of a Heterogeneous Architecture, Protocol Stack, Comparison of the Integrated Architecture.

TEXTBOOKS:

1. Carlos Cordeiro and Dharma P Agarwal, Ad hoc sensor networks-Theory and Applications by World Scientific publications March 2006.
2. C. Siva Ram Murthy, and B. S. Manoj, "Ad Hoc Wireless Networks: Architectures and Protocols ", Prentice Hall Professional Technical Reference, 2008.

REFERENCE BOOKS:

1. Feng Zhao and Leonides Guibas, "Wireless Sensor Networks", Elsevier Publication – 2002.
2. Holger Karl and Andreas Willig "Protocols and Architectures for Wireless Sensor Networks", Wiley, 2005
3. Kazem Sohraby, Daniel Minoli, & Taieb Znati, "Wireless Sensor Networks-Technology, Protocols, and Applications", John Wiley, 2007.
4. Anna Hac, "Wireless Sensor Network Designs", John Wiley, 2003.

Ad hoc sensor Networks LAB

Course Learning Outcomes:

- To be able to understand importance of Microcontroller Programming and assembly programming languages.
- To be able to understand about importance of various Interfaces.

Note:

- At least 10 experiments are to be carried out from the below.

LIST OF EXPERIMENTS

Simulation Experiments

1. AODV
2. DSDV
3. DSR
4. Multicast Protocol
5. Other Routing Protocols

Microcontroller Programming

1. Glowing LEDs.
2. Toggling LED’s.
3. Transmitting a string through UART.
4. Controlling LEDs blinking pattern through UART
5. Echo each character typed on HyperTerminal.

RF Experiments

1. Point to point communication of two C-Motes over the radio frequency.
2. Multi-point to single point communication of C-Motes over the radio frequency.

TEXTBOOKS:

1. Vijay Madisetti and Arshdeep Bahga, “Internet of Things (A Hands-on-Approach)”, 1 st Edition, VPT, 2014

REFERENCE BOOKS:

17ES004 Design of IoT System (IoT)

L	T	P	C
3	-	3	5

Course Description and Objectives:

- Students will be able to design & develop IOT Devices.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Able to programs for IoT applications
- Able to design the framework necessary for IoT applications
- Able to develop prototypes for IoT devices and app

SKILLS ACQUIRED:

- Able to understand IoT Concepts
- Able to design the different IoT system applications.

ACTIVITIES:

- *design various simple IoT Applications*

Unit – I **L-12**

Developing Internet of Things & Logical Design using Python: Introduction, IOT Design Methodology, Installing Python, Python Data Types & Data Structures, Control Flow, Functions, Modules, Packages, File Handling, Date/ Time Operations, Classes, Python Packages, IoT Physical Servers and Cloud Offerings: introduction to cloud sotrage models and communication APIs, Python Web Application Framework - Django, SkyNet IoT Messaging Platform.

Unit – II **L-12**

Design Principles for Connected Devices: Design Principles for Connected Devices, Calm and Ambient Technology, Magic as Metaphor, Privacy, Web Thinking for Connected Devices, Affordances

Unit – III **L-12**

Thinking About Prototyping: Sketching, Familiarity, Costs versus Ease of Prototyping, Prototypes and Production, Open Source versus Closed Source, Tapping into the Community

Prototyping Embedded Devices: Electronics, Embedded Computing Basics, Arduino, Raspberry Pi, BeagleBone Black, Electric Imp, Other Notable Platforms

Unit - IV **L-12**

Prototyping Online Components: Getting Started with an API, Writing a New API, Real-Time Reactions, Other Protocols

Techniques for Writing Embedded Code: Memory Management, Performance and Battery Life, Libraries, Debugging

Unit-V **L-12**

Case Studies Illustratign IoT Design: Introduction, Home automation-smart lighting-home intrusion detection, Cities-smart parking, Environment-Air pollution monitoring, Agriculture-smart irrigation, productivity appliances-IoT printer,Data Analytics for IoT: Introduction

TEXTBOOKS:

1. Vijay Madisetti, Arshdeep Bahga," Internet of Things A Hands-On- Approach",2014,
2. Adrian McEwen, "Designing the Internet of Things", Wiley Publishers, 2013,
3. Microsensors, MEMS, and Smart Devices, Julian W. Gardner, Vijay K. Varadan Osama O. Awadelkarim, 2001, John Wiley & Sons Ltd

REFERENCE BOOKS:

1. Francis daCosta, "Rethinking the Internet of Things: A Scalable Approach to Connecting Everything", 1 st Edition, Apress Publications, 2013.
2. Cuno Pfister, Getting Started with the Internet of Things, O‟Reilly Media, 2011, ISBN: 978-1-4493- 9357-1.

Internet of Things (Lab)

Course Learning Outcomes:

- To be able to understand importance of Python Programming and its usage.
- To be able to understand and work with Raspberry Pi and Arduino

LIST OF EXPERIMENTS

1. Familiarization with Python programming, use of various functions
2. Create python code to understand the tendency of users on social media platform
3. Storing the local data to cloud using Python
4. Sending Messages over internet using python
5. Familiarization with raspberry pi board
6. Python Programming for the Raspberry Pi and interfacing with web
7. Familiarization with Arduino board
8. Python Programming for Arduino and interfacing with web
9. Controlling lights remotely using Raspberry Pi
10. Detecting the movement of objects and sending caution signals remotely using Raspberry Pi

17ES006 EMBEDDED LINUX

L	T	P	C
3	1	-	4

Course Description and Objectives:

This course provides

- The fundamentals of operating system.
- The basic understanding of Linux operating system.
- The basic knowledge on board support packages and device drivers.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Understand the concept of operating system.
- Understand the complexities of Embedded Linux Distributions in embedded systems.
- Understand the concept of Board support package
- Understand about different drivers used in embedded system.

SKILLS ACQUIRED:

- To learn how to configure, boot and test Embedded Linux distributions and applications running on Embedded Linux target systems.
- Build embedded systems using Embedded Linux operating systems

ACTIVITIES:

1. Doing projects using Embedded Linux for different applications.

Unit – I **L-12**

Fundamentals of Operating Systems: Overview of operating systems, Process and threads, Processes and Programs, Programmer view of processes, OS View of processes, Threads, Scheduling, Non preemptive and preemptive scheduling, Real Time Scheduling, Process Synchronization, Semaphores, Message Passing, Mailboxes, Deadlocks, Synchronization and scheduling in multiprocessor Operating Systems

Unit – II **L-12**

Linux Fundamentals: Introduction to Linux, Basic Linux commands and concepts, Logging in, Shells, Basic text editing, advanced shells and shell scripting, Linux File System, Linux programming, Processes and threads in Linux, Inter process communication, Devices, Linux System calls.

Unit – III **L-12**

Introduction to Embedded Linux

Embedded Linux-Introduction, Advantage, Embedded Linux Distributions, Architecture, Linux kernel architecture, User space, Linux startup sequence, GNU cross platform Tool chain.

Unit – IV **L-12**

Board Support Package and Embedded Storage

Inclusion of BSP in kernel build procedure, Boot loader Interface, Memory Map, Interrupt Management, PCI Subsystem, Timers, UART, Power Management, Embedded Storage, Flash Map, Memory Technology Device (MTD) –MTD Architecture, MTD Driver for NOR Flash, The Flash Mapping drivers, MTD Block and character devices, mtdutils package, Embedded File Systems, Optimizing storage space – Turning kernel memory.

Unit – V **L-12**

Embedded Drivers and Application Porting

Linux serial driver, Ethernet driver, I2C subsystem, USB gadgets, Watchdog timer, Kernel Modules, Application porting roadmap, Programming with threads, Operating System Porting Layer, Kernel API Driver, Case studies RTLinux – uClinux.

TEXTBOOKS:

1. P. Raghavan ,Amol Lad , Sriram Neelakandan, 'Embedded Linux System Design and Development', Auerbach Publications 2006

REFERENCE BOOKS:

4. Karim Yaghmour, 'Building Embedded Linux Systems', O'Reilly Publications 2003
5. Abott,Linux for Embedded and real time applications,newness,3rdedition.

17ES008- EMBEDDED SYSTEM DESIGN WITH FPGAS

L	T	P	C
3	1	-	4

Course Objectives:

The basic objective of this course is to understand how a FPGA and the Hardware Description Language (HDL) can be used in the design of embedded digital systems. Simulation and synthesis of HDL code of digital logic using HDL, for a given FPGA device and processor-based FPGA devices.

Course Outcomes:

At the end of the course, the students should be able to:

1. Understand the fundamentals of embedded systems from both hardware and software perspective,
2. Understand how to design digital circuits with VHDL.
3. Understand how to design complex state machines in VHDL and also verify the designs using Modelsim simulator.
4. Prototype digital design on an FPGA.
5. Understand logic simulation and synthesis for FPGA.
6. Understand basic aspects of embedded processors (ARM) and Bus Interfaces

SKILLS ACQUIRED:

Student is able to write code synthesize and implement

- basic digital circuits in HDL using data flow, behavioral and structural modeling styles
- Embedded cores in modern FPGAs.
- Input/output interfacing principles, bus architectures and standard interfaces.
- Embedded system design with HDL cores.

UNIT – I

Introduction

Introduction to Embedded System Overview, Hypothetical Robot Control System, Digital Design Platforms - Microprocessor-based Design, Single-chip Computer/Microcontroller-based Design, Application Specific Standard Products (ASSPs), Design Using FPGA; Organization of the Book;

Hardware Description Language: Verilog

Software and Hardware Description Languages, Let's Use Verilog as Our HDL, Design Examples Using Verilog - Gate Level Model, Combinational Circuits Using Data Flow Modelling, Behavioural Logic, Finite State Machine (FSM), Arithmetic Using HDL, Pipelining, Module Instantiation and Port Mapping, Use of Pre-designed HDL Codes, Simulating Digital Logic Using Verilog - EDA Tool Flow for Simulation, Creating a Test Bench for HDL-based Digital Logic, Post Place and Route Simulation, Simulation of Algorithm Using Pre-designed Codes.

UNIT – II

FPGA Devices

FPGA and CPLD, Architecture of a FPGA - FPGA Interconnect Technology, Logic Cell, FPGA Memory, Clock Distribution and Scaling, I/O Standards, Multipliers, Floor Plan and Routing, Timing Model for a FPGA, FPGA Power Usage.

FPGA-based Embedded Processor

Hardware–Software Task Partitioning, FPGA Fabric Immersed Processors, Soft Processors, Hard Processors, Tool Flow for Hardware–Software Co-design, Interfacing Memory to the Processor, Interfacing Processor with Peripherals, Types of On-chip Interfaces, Wishbone Interface, Avalon Switch Matrix, OPB Bus Interface, Design Re-use Using On-chip Bus Interface, Creating a Customized Microcontroller, Robot Axis Position Control.

UNIT – III

FPGA-based Signal Interfacing and Conditioning

Serial Data Communication, Physical Layer for Serial Communication, RS-232-based Point-to-Point Communication, RS-485-based Multi-point Communication, Serial Peripheral Interface (SPI), Signal Conditioning with FPGAs.

UNIT – IV

Motor Control Using FPGA

Introduction to Motor Drives, Digital Block Diagram for Robot Axis Control, Position Loop, Speed Loop, Power Module, Case Studies for Motor Control - Stepper Motor Controller, Permanent Magnet DC Motor, Brushless DC Motor, Permanent Magnet Rotor (PMR) Synchronous Motor, Permanent Magnet Synchronous Motor (PMSM).

UNIT – V

Prototyping Using FPGA

Prototyping Using FPGAs, Test Environment for the Robot Controller, FPGA Design Test Methodology, UART for Software Testing, FPGA Hardware Testing Methodology.

TEXTBOOKS:

COURSE	CONTENTS FOR POOL OF ELECTIVES				
17ES009	Introduction To Internet Of Things	3	1	-	4
17ES011	Soft Computing	3	1	-	4
17ES013	Adaptive Signal Processing	3	1	-	4
17ES015	System On Chip Design	3	1	-	4
17ES017	Digital Image And Video Processing	3	1	-	4
17ES019	Data Communications	3	1	-	4
17ES021	Neural Networks & Fuzzy Systems	3	1	-	4
17ES023	Scripting Languages(Common To Vlsi)	3	1	-	4
17ES010	Risc Processors Architecture And Programming	3	1	-	4
17ES012	Micro Electro Mechanical System	3	1	-	4
17ES014	Dsp Processors	3	1	-	4
17ES016	Computer Architecture And Parallel Processing	3	1	-	4
17ES018	Robotics And Automation	3	1	-	4
17ES020	Cryptography And Network Security	3	1	-	4
17ES022	Smart Instrumentation	3	1	-	4
17ES024	Wireless Communications And Networks	3	1	-	4

17ES009 Introduction to Internet of Things (IoT)

L	T	P	C
3	1	-	4

Course Description and Objectives:

- Students will be explored to the interconnection and integration of the physical world and the cyber space.
-

Course Outcomes:
Upon successful completion of this course student should be able to:

- Able to understand the application areas of IOT
- Able to realize the revolution of Internet in Mobile Devices, Cloud & Sensor Networks
- Able to understand building blocks of Internet of Things and characteristics

SKILLS ACQUIRED:

- *Able to understand IoT Concepts*
- *Able to design the different IoT system applications.*

ACTIVITIES:

- *design various simple IoT Applications*

Unit – I **L-12**

Introduction & Concepts: Introduction to Internet of Things, Physical Design of IOT, Logical Design of IOT, IOT Enabling Technologies, IOT Levels

Unit – II **L-12**
Internet Principles: Internet Communications: An Overview, IP Addresses, MAC Addresses, TCP and UDP Ports, Application Layer Protocols
Domain Specific IOTs: Home Automation, Cities, Environment, Energy, Retail, Logistics, Agriculture, Industry, Health & Life Style.

Unit – III **L-12**
M2M & System Management with NETCONF-YANG: M2M, Difference between IOT and M2M, SDN and NFV for IOT, Software defined Networking, Network Function Virtualization, Need for IOT Systems Management, Simple Network Management Protocol, Limitations of SNMP, Network Operator Requirements, NETCONF, YANG, IOT Systems management with NETCONF-YANG.

Unit - IV **L-12**
Sensors and Actuators: Micro sensors: Introduction, Thermal Sensors, Radiation Sensors, Mechanical Sensors, Magnetic Sensors, Bio(chemical) Sensors,

Unit-V **L-12IOT**
Physical Devices & Endpoints: What is an IOT Device, Exemplary Device, Board, Linux on Raspberry Pi, Interfaces, and Programming & IOT Devices

TEXTBOOKS:

1. Vijay Madisetti, Arshdeep Bahga," Internet of Things A Hands-On- Approach",2014,
2. Adrian McEwen, "Designing the Internet of Things", Wiley Publishers, 2013,
3. Steve Heath, "Embedded Systems Design", 2nd Edition, Newnes.

REFERENCE BOOKS:

1. Francis daCosta, "Rethinking the Internet of Things: A Scalable Approach to Connecting Everything", 1 st Edition, Apress Publications, 2013.

17ES011 SOFT COMPUTING

L	T	P	C
3	1	-	4

Course Description and Objectives:

- To review the fundamentals of ANN and fuzzy set theory
- To make the students understand the use of ANN for modeling and control of non-linear system and to get familiarized with the ANN and FLC tool box.
- To make the students to understand the use of optimization techniques.
- To familiarize the students on various hybrid control schemes, P.S.O and get
- To familiarized with the ANFIS tool box.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Will be able to know the basic ANN architectures, algorithms and their limitations.
- Will be able to know the different operations on the fuzzy sets.
- Will be capable of developing ANN based models and control schemes for non-linear system.
- Will get expertise in the use of different ANN structures and online training algorithm.
- Will be knowledgeable to use Fuzzy logic for modeling and control of non-linear systems.

SKILLS ACQUIRED:

- *Familiarization with ANN Tool Box*
- *Familiarization with ANFIS Tool Box*
- *Familiarization with FLC Tool Box*

Unit – I

Review of fundamentals - Biological neuron, Artificial neuron, Activation function, Single Layer
Perceptron – Limitations – Multi Layer Perceptron – Back propagation algorithm (BPA); Fuzzy
set theory – Fuzzy sets – Operation on Fuzzy sets - Scalar cardinality, fuzzy cardinality, union and
intersection, complement (yager and sugeno), equilibrium points, aggregation, projection, composition, decomposition, cylindrical extension, fuzzy relation – Fuzzy membership functions.

L-14

Unit - II

Modeling of non linear systems using ANN- NARX,NNSS,NARMAX - Generation of training data - optimal architecture – Model validation- Control of non linear system using ANN Direct and Indirect neuro control schemes- Adaptive neuro controller – Case study - Familiarization of Neural Network Control Tool Box.

L-14

Unit – III

Modeling of non linear systems using fuzzy models(Mamdani and Sugeno) –TSK model - Fuzzy

Logic controller – Fuzzification – Knowledge base – Decision making logic – Defuzzification-
Adaptive fuzzy systems- Case study - Familiarization of Fuzzy Logic Tool Box.

L-12

Unit - IV

Basic concept of Genetic algorithm and detail algorithmic steps, adjustment of free parameters. Solution of typical control problems using genetic algorithm. Concept on some other search techniques like Tabu search, Ant-colony search and Particle Swarm Optimization.

L-12

Unit-V

Fuzzification and rule base using ANN–Neuro fuzzy systems-ANFIS –Optimization of membership function and rule base using Genetic Algorithm and Particle Swarm Optimization - Case study–Introduction to Support Vector Regression – Familiarization of ANFIS Tool Box.

Activities:

2. Performing simple experiments using ANN Tool Box
3. Performing simple experiments using FLC Tool Box
4. Performing simple experiments using ANFIS Tool Box

TEXTBOOKS:

1. Laurene V.Fausett, “Fundamentals of Neural Networks, Architecture, Algorithms, and Applications”, Pearson Education, 2008.

2. George J.Klir and Bo Yuan, “Fuzzy Sets and Fuzzy Logic: Theory and Applications”, Prentice HalI, First Edition, 1995.
3. N.P Padhy, S.P. Simon “Soft Computing With MATLAB Programming”,OXFORD print Feburary 2015.

17ES5013 - ADAPTIVE SIGNAL PROCESSING

L	T	P	C
3	1	-	4

Course Description and Objectives:

Adaptive signal processing concerns with processing of signals where the processing parameters are adjusted continuously to suit time varying signal environmental conditions. The study of adaptive signal processing involves development of various adaptation algorithms and assessing them in terms of convergence rate, computational complexity, robustness against noisy data, hardware complexity, numerical stability etc. This course demonstrates the design of important class of adaptive filters, LMS, RLS and Kalman filters.

Course Outcomes:
Upon successful completion of this course student should be able to:

- Explain the importance of signal processing in non-stationary environment.
- Explain the role and importance of adaptive signal processing in communications signal processing
- List and apply the various mathematical models to adaptive signal processing.
- Understand the problem of finding the minimum error criteria.
- Use computer based simulation tools to understand the theoretical concepts of adaptive signal processing in various communication applications.

SKILLS ACQUIRED:

- *Able to analyze statistical properties of a signal.*
- *Able to design different adaptive filters for different applications.*
- *Able to use different algorithms such as LMS, NLMS, RLS for designing adaptive filters.*

ACTIVITIES:

- *Design of linear prediction filter using MATLAB*
- *Design of LMS filter using MATLAB*
- *Design of RLS filter using MATLAB*
- *Design of Kalman filter using MATLAB*

Unit – I
L12
Introduction: The filtering problem, Adaptive filters, linear filter structures, approaches to the development of linear adaptive filter algorithms, real and complex forms of adaptive filters, non linear adaptive filters, Applications.
Stationary Processes and Models: Partial characterization of a discrete time stochastic process, mean ergodic theorem, correlation matrix, correlation matrix of sine wave plus noise, stochastic models, wold decomposition, asymptotic stationarity of an auto regressive process. Yule-Walker equations. Selecting the model order. Complex Gaussian process.

Unit – II **L-12**

Wiener Filters: Linear optimum filtering problem statement, principle of orthogonality, minimum mean squared error, wiener – hopf equations, error– performance surface. Channel equalization. Linearly constrained minimum variance filter , generalized side lobe cancellers.

Unit – III **L12**

Linear Prediction: Forward Linear Prediction, backward Linear Prediction, Levinson-Durbin algorithm, properties of prediction error filters, Schur-Cohntest, auto regressive modeling of a stationary stochastic process, Cholesky factorization, lattice predictors, joint process estimation, block estimation.

Method of steepest descent: Steepest descent algorithm, stability of the Steepest descent algorithm.

Unit – IV **L12**

Least Mean Square (LMS) Algorithm: Over view of the structure and operation of the Least Mean square Algorithm, Least Mean square adaptation Algorithm, stability and performance analysis of the LMS algorithm. Normalized Least Mean Square (NLMS) Algorithm, Concept of method of least squares,

Recursive Least Squares (RLS) Algorithm: The matrix inversion lemma, the exponentially weighted RLS algorithm, update recursion for the sum of weighted error squares. Convergence analysis of the RLS algorithm.

Unit-V **L12**

Kalman Filters: Recursive minimum mean square estimation for scalar random variables, statement of the Kalman filtering problem, the innovations process, estimation of the state using the innovations process, filtering, initial conditions, variants of the Kalman filter, extended Kalman filtering.

TEXTBOOKS:

1. Adaptive Filter Theory, S. Haykin, Prentice-Hall, 4-th edition, 2001.
2. Fundamentals of Adaptive Filtering, Ali H. Sayed, John Wiley, 2003.

REFERENCE BOOKS:

1. Monson H. Hayes , "Statistical Digital Signal Processing And Modeling", Wiley India, 2008.
2. John G. Proakis, Dimitris G.Manolakis, "Digital Signal Processing, Principles, Algorithms and Applications", Pearson Education / PHI, 2007.
3. B. Farhang-Boroujen, "Adaptive Filters: Theory and Applications", John Wiley and Sons, 2013.

17ES5015 - SYSTEM ON CHIP DESIGN

L	T	P	C
3	1	-	4

Course Objectives:

- To understand the concepts of System on Chip Design methodology for Logic and Analog Cores.
- To understand the concepts of System on Chip Design Validation.
- To understand the concepts of SOC Testing.

Course Outcomes:

- Upon successful completion of this course student should be able to: Able to understand about SoC Design Methodology.
- Ability to understand the design of different embedded memories.
- SoC Design Validation and Testing Concepts can be understood.

SKILLS ACQUIRED:

- Can able to design various embedded memories

ACTIVITIES:

To perform PSOC based mini projects

UNIT – I

Introduction- System tradeoffs and evolution of ASIC Technology- System on chip concepts and methodology – SoC design issues -SoC challenges and components.

UNIT – II

Design Methodological For Logic Cores- SoC Design Flow – On-chip buses –Design process for hard cores –Soft and firm cores – Core and SoC design examples.

UNIT – III

Design Methodology for Memory and Analog Cores- Embedded memories –Simulation modes Specification of analog circuits – A to D converter –Phase locked loops –High I/O.

UNIT – IV

Design Validation- Core level validation –Test benches –SoC design validation – Co simulation –hardware/ Software co-verification. Case Study: Validation and test of systems on chip.

UNIT – V

SocTesting- SoC Test Issues –Cores with boundary scan –Test methodology for design reuse–Testing of microprocessor cores – Built in self-method –testing of embedded memories. Case Study: Integrating BIST techniques for on-line SoC testing.

TEXTBOOKS:

1. RochitRajsunah, System- on - a -chip: Design and Test, Artech House, 2007.
2.PrakashRaslinkar, Peter Paterson &Leena Singh, System-on-a-chip verification: Methodology and Techniques, Kluwer Academic Publishers, 2000.

REFERENCEBOOKS:

17ES017- Digital video processing

L	T	P	C
3	1	-	4

Course Description and Objectives:

1. To learn basic operations on Images.
2. To learn advanced digital image processing techniques related to segmentation and recognition.
3. To learn fundamentals of digital video processing.
4. To lean video compression techniques.

Course Outcomes:

Upon successful completion of this course student should be able to:

1. Able to apply basic mathematical tools on images to perform filtering
2. Acquire ability to interpret and analyze 2D signals in the frequency domain through the Fourier transforms.
3. Able to do further research in video processing.

SKILLS ACQUIRED:

1. To program operations on images
2. Object detection using image processing
3. Basic operations on video signals

ACTIVITIES:

1. Smoothening of image using filters.
2. Sharpening of image by using filters.
3. Implementation of wavelet transforms.

UNIT-I

L12

Fundamentals steps of Image processing: Components of an Image processing system, Image sampling and quantization, relationship between the pixels. Gray level transformation, Histogram processing, Smoothing and sharpening spatial filters, Smoothing and sharpening frequency domain filters

UNIT-II

L12

Image compression and segmentation: Compression models, Error free coding, lossycoding, compression standards.Image segmentation: Edge linking and boundary detection, Thresholding, Region based segmentation

UNIT-III

L12

Video Representation : Video formation, perception and representation: Color perception and specification, Video capture and display, Analog video raster, Analog color TV systems, Digital VideoVideo Sampling: Basics of lattice theory, sampling over lattice, Sampling of video signals, filtering operations, Conversion of signals sampled on different lattices, Sampling rate conversion of video signals.

UNIT-IV
L12
Video Modeling: Camera model, illumination model, object model. Scene model, Two dimensional motion models 2-D motion estimation: Optical flow, General methodologies, Pixel based motion estimation, Block matching algorithm, Mesh-based motion estimation, Global motion estimation. Application of motion estimation in video coding

UNIT-V
L12
Video Coding: Information theory, Binary encoding, Scalar quantization, Vector quantization, Waveform based video coding: Block based transform coding, Predictive coding, Object based scalability, Wavelet Transform based coding

TEXTBOOKS:

1. Digital Image Processing 3e by Rafael C. Gonzalez Richard E. Woods Pearson Education India; Third edition (23 June 2016)
2. Video Processing and Communications (Prentice-Hall Signal Processing Series) by Yao Wang JornOstermannYa-Qin Zhang Pearson (27 September 2001)

REFERENCEBOOKS:

1. Digital Video Processing (Prentice-Hall Signal Processing Series) by A. Murat TekalpPrentice Hall; 2 edition (18 June 2015)
2. Handbook of Image and Video Processing (Communications, Networking and Multimedia) 2nd ,Kindle Edition by Alan C. BovikAcademic Press; 2 edition (21 July 2010)

17ES019-Data Communications

L	T	P	C
3	1	-	4

Course Description and Objectives:

The objective of the course is to ensure that students have the necessary networking skills to design, implement, and analyze data communication networks

Course Outcomes:

- To be able to understand the concepts of data communication and networks
- To be able to understand different protocols that are require at various layers of the network model
- To be able to analyze the given network and know its performance for various situations.

Skills Acquired:

- Gain knowledge on Data Communication Networks,
- Design of Various Networks
- Simulation of Routing Protocols

Activities:

1 simulation of distance vector algorithm
2 simulation of link state algorithm
3 simulation of RIP algorithm
4 simulation of IGRP and EIGRP routing protocols
5 Spanning Tree algorithm and bridging
6 implementation of HTML http web pages and hosting it to server

UNIT – I

Data Communication Systems

History of data communications, Network architecture, Protocols and standards, Layered network architecture, Open systems interconnection, Network topologies, LAN, WAN and MAN, Data communication hardware, DTE and DCE, Serial interfaces, Network interface card, Modem, Digital data digital signals, Digital data analog signals, Circuit switching vs. Packet switching

UNIT – II

Local Area Networks

Transmission formats – Baseband vs Broadband, LAN topologies, Collision vs broadcast domains, Connectivity devices, Medium access control and Logical link control sublayers, Channel access problem, MAC addressing, Ethernet - evolution of Ethernet, Variants of Ethernet.

UNIT – III

Internetworking
TCP/IP Protocol suite, Comparison with ISO suite, IP address notation, IP address classes, Address masking, Introduction to subnetting, Subnet masking for Class A, B, and C, Supernetting, Classless IP addressing, Classless interdomain routing , Address resolution protocol, Hardware addresses vs IP addresses, IP datagram, Different fields of IP header

UNIT - IV

IPv6 and Routing
Internet protocol version 6, Advantages of IPv6, IPv6 Addressing format, IPv6 header, Routing in Internets, Static vs Dynamic routing, Routing Tables, Distance Vector Routing, Link State Routing, Hierarchical routing, Broadcast Routing, Multicast Routing

UNIT – V

Transport and Application Layers
Transport layer protocols, Introduction to transport layer, Port address, User datagram protocol- UDP, Transmission control protocol-TCP, Header of TCP, Various fields of TCP header, TCP connection establishment and termination, TCP error control and Flow control, Domain name system-DNS, Dynamic host configuration protocol-DHCP

TEXT BOOKS:

1. Wayne Tomasi, "Introduction to Data Communication and Networking", 1/e, Pearson Education
2. A S Tanenbaum, "Computer Networks", 5th Edition, PHI

REFERENCE BOOKS:

1. James .F. Kurouse & W. Rouse, "Computer Networking: A Topdown Approach Featuring", 3/e, Pearson Education.
2. Forouzan, "Data Communications and Networking", 4th Edition, McGraw Hill

Scripting Languages Lab

Course Description and Objectives:

- This course provides an introduction to the script programming paradigm
- Introduces scripting languages such as Perl and Python.
- Learning TCL

Course Outcomes:

- Comprehend the differences between typical scripting languages and application programming languages.
- Acquire programming skills using scripting languages.
- Gain knowledge of the strengths and weakness of Perl, TCL and Python and select an appropriate language for solving a given problem.

17ES021 - NEURAL NETWORKS & FUZZY SYSTEMS

L	T	P	C
3	1	-	4

Course Description and Objectives:

This course aims at introducing the fundamental theory and concepts of computational intelligence methods, in particular neural networks, fuzzy systems, genetic algorithms and their applications in the area of machine intelligence.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Understand the fundamental theory and concepts of neural networks, neuro-modeling, several neural network paradigms and its applications.
- Understand the concepts of fuzzy sets, knowledge representation using fuzzy rules, approximate reasoning, fuzzy inference systems, and fuzzy logic control and other machine intelligence applications of fuzzy logic.
- Understand the basics of an evolutionary computing paradigm known as genetic algorithms and its application to engineering optimization problems

SKILLS ACQUIRED:

- *Evaluate the learning strategies and learning rules*
- *Designing of feed forward and feedback network*
- *Familiarized with different logical components*
- *Ability to solve different Fuzzy logic based problems*
- *Knowledge to apply various learning strategies and learning rules*

ACTIVITIES:

1. Multi-layer feedforward networks: Matlab Implementation
2. Applications using matlab
3. Design and implement a neural network simulation (with two modes ofoperation: learning and processing) using a high-level language C++.
4. A Matlab based simulation study to neuro-fuzzy system.
5. Assess the power and usefulness of artificial neural networks in severalapplications including speech synthesis, diagnostic problems, business andfinance, robotic control, signal processing, computer vision and many otherproblems that fall under the category of pattern recognition

Unit – I

Introduction to Neural Networks: Introduction, Organization of the Brain, testing. Biological and Artificial Neuron Models, Integrate-and-Fire Neuron Model, McCulloch-Pitts Model, Characteristics of ANN, Potential Applications of ANN. Artificial Neuron Model, Operations of Artificial Neuron, Types of Neuron Activation Function, ANN Architectures, Classification Taxonomy of ANN -– Connectivity, Neural Dynamics (Activation and Synaptic), Learning Strategy (Supervised, Unsupervised, Reinforcement), Learning Rules, Types of Application..

L-14

Unit - II

Single Layer & Multi-layer Feed forward Neural Networks: Introduction, Perceptron Models: Discrete, Continuous and Multi-Category, Training Algorithms: Discrete and Continuous Perceptron Networks, Perceptron Convergence theorem, Limitations of the

Perceptron Model, Applications. Credit Assignment Problem, Generalized Delta Rule, Derivation of Back propagation (BP) Training, Summary of Back propagation Algorithm, Kolmogorov Theorem, Learning Difficulties and Improvements.

L-14

Unit - III

Associative Memories: Paradigms of Associative Memory, Pattern Mathematics, Hebbian Learning, General Concepts of Associative Memory (Associative Matrix, Association Rules, Hamming Distance, The Linear Associator, Matrix Memories, Content Addressable Memory), Bidirectional Associative Memory (BAM) Architecture, BAM Training Algorithms: Storage and Recall Algorithm, BAM Energy Function, Proof of BAM Stability Theorem Architecture of Hopfield Network: Discrete and Continuous versions, Storage and Recall Algorithm, Stability Analysis, Capacity of the Hopfield Network Summary and Discussion of Instance/Memory Based Learning Algorithms, Applications.

Neural network applications: Process identification, control, fault diagnosis and load forecasting.

L-12

Unit - IV

Classical & Fuzzy Sets : Introduction to classical sets - properties, Operations and relations; Fuzzy sets, Membership, Uncertainty, Operations, properties, fuzzy relations, cardinalities, membership functions.

L-12

Unit-V

Fuzzy Logic System Components: Fuzzification, Membership value assignment, development of rule base and decision making system, Defuzzification to crisp sets, Defuzzification methods. Fuzzy logic applications: Fuzzy logic control and Fuzzy classification.

TEXTBOOKS:

3. Rajasekharan and Rai, “Neural Networks, Fuzzy logic, Genetic algorithms: synthesis and applications”, PHI Publication.
4. S.N.Sivanandam, S.Sumathi, S.N.Deepa, “Introduction to Neural Networks using MATLAB 6.0 “TMH, 2006

REFERENCE BOOKS:

1. James A Freeman and Davis Skapura, “Neural Networks”, Pearson Education, 2002.
2. Simon Hakins, “Neural Networks”, Pearson Education
3. C.Eliasmith and CH.Anderson, “Neural Engineering”, PHI
4. Bart Kosko, “Neural Networks & Fuzzy systems”.
5. Driankov D., Hellendoorn H. & Reinfrank M.,..An Introduction to Fuzzy Control., Narosa Publications ,1993

17ES023-Scripting Languages

Course Description and Objectives:

- This course provides an introduction to the script programming paradigm
- Introduces scripting languages such as Perl and Python.
- Learning TCL

Course Outcomes:

- Comprehend the differences between typical scripting languages and application programming languages.
- Acquire programming skills using scripting languages.
- Gain knowledge of the strengths and weakness of Perl, TCL and Python and select an appropriate language for solving a given problem.

SKILLS ACQUIRED:

- Able to implement any program using scripting language.
- Able to resolve security issues in internet programming.
- Write a program of employs list of a company using perl.
- Write a programming of security issues on operative systems in perl.
- Write a program to store the data using TCL.
- Execute a program on addition by using eval function.
- Design a window and widget using TK.

UNIT – I

Introduction to PERL and Scripting Scripts and Programs, Origin of Scripting , Scripting Today, Characteristics of Scripting Languages,Uses for Scripting Languages, Web Scripting, and the universe of Scripting Languages. PERL- Names and Values, Variables, Scalar Expressions, Control Structures, arrays, list, hashes, strings, pattern and regular expressions, subroutines.

UNIT – II

Advanced perl Finer points of looping, pack and unpack, filesystem, eval, datastructures, packages, modules, objects, interfacing to the operating system, Creating Internet ware applications, Dirty Hands Internet Programming, security Isses.

UNIT – III

TCL TCL Structure, syntax, Variables and Data in TCL, Control Flow, Data Structures, input/output, procedures , strings , patterns, files, Advance TCL- eval, source, exec and uplevel commands, Name spaces, trapping errors, event driven programs, making applications internet aware, Nuts and Bolts Internet Programming, Security Issues, C Interface. Tk Tk-Visual Tool Kits, Fundamental Concepts of Tk, Tk by example, Events and Binding , PerlTk.

UNIT - IV

Python Introduction to Python langauge, python-syntax, statements, functions, Built-in-functions and Methods, Modules in python,Exception Handling. Integrated

UNIT – V

Web Applications in Python – Building Small, Efficient Python Web Systems, Web Application Framework.

TEXT BOOKS:

1. The World of Scripting Languages , David Barron,Wiley Publications.
3. Python Web Programming, Steve Holden and David Beazley ,New Riders Publications.

REFERENCE BOOKS:

1. Open Source Web Development with LAMP using Linux Apache,MySQL,Perl and PHP,J.Lee and B.Ware(Addison Wesley) Pearson Education.
2. Programming Python,M.Lutz,SPD.
35. Core Python Programming,Chun,Pearson Education.
6. Guide to Programming with Python,M.Dawson,Cengage Learning.
7. Perl by Example,E.Quigley,Pearson Education.
8. Programming Perl,Larry Wall,T.Christiansen and J.Orwant, O'Reilly, SPD.
9. Tcl and the Tk Tool kit,Ousterhout,Pearson Education.
10. 11. Perl Power,J.P.Flynt,Cengage Learning.
12. PHP Programming solutions,V.Vaswani,TMH.

Scripting Languages Lab

Course Description and Objectives:

- This course provides an introduction to the script programming paradigm
- Introduces scripting languages such as Perl and Python.
- Learning TCL

Course Outcomes:

- Comprehend the differences between typical scripting languages and application programming languages.
- Acquire programming skills using scripting languages.
- Gain knowledge of the strengths and weakness of Perl, TCL and Python and select an appropriate language for solving a given problem.

1. Write a script that calculates the average performance score and prints out the members of the groups meeting the following criteria (each criterion should produce one group, rather than identifying a group that meets all four criteria):
   (a) native language is English (b) age is greater than 20 (c) age is greater than 20 and native language is English (d) performance score is greater than 70
2. Suppose you're given the following arrays containing participant information: @firstnames = ("Sarah", "Jareth", "Ludo", "Hoggle"); @lastnames = ("Williams", "King", "Beast", "Dwarf"); Write a script that asks the user whether the names should be sorted by first or last names, and whether the names should be sorted alphabetically or reverse alphabetically. Then, sort the participant list this way, and print out the sorted list of participants. Look at sort names reverseABC.pl for an example of sorting these names reverse alphabetically.

3. Suppose you're given the following arrays containing participant information: @firstnames = ("Sarah", "Jareth", "Ludo", "Hoggle"); @lastnames = ("Williams", "King", "Beast", "Dwarf"); @ages = (15, 39, 33, 43); @nativelanguages = ("English", "English", "Romanian", "English"); @performancescores = (85, 99, 35, 75);
4. Suppose you're given the following arrays containing participant information: @usernames = ("Sarah1", "Sarah2", "sarah3", "sArah4"); @scores = (10, 7, 42, 3);
   Write a program that outputs the participant information, sorted in one of the following ways: (a) ASCII-betical by participant username (b) case-insensitive ASCII-betical by participant username (c) numerical order by participant score (lowest to highest) (d) reverse numerical order by participant score (highest to lowest) The user should be able to choose which sorting order is preferred (default ASCIIbetical on username) using a command line option. If you get stuck, have a peek at sort revnum.pl for an example of sorting this information reverse numerically.
5. Write a program on Recursive Procedures in TCL?
6. Write a program on Procedures with Variable Arguments in TCL?
7. Write a program on how to create a namespaces in TCL?
8. Write a program on regular expressions in TCL?
9. Design widget using TK?
10. Write a program on tuples in python?
11. Write a program on how to create strings?
12. Write a program on how to send one e-mail using Python script.

17ES010 - RISC Processors Architecture and Programming

L	T	P	C
3	1	-	4

Course Description and Objectives:

The RISC concept has led to a more thoughtful design of the microprocessor. Among design considerations are how well an instruction can be mapped to the clock speed of the microprocessor (ideally, an instruction can be performed in one clock cycle).The ARM architecture is the industry's leading 16/32-bit embedded RISC processor solution. ARM Powered microprocessors are being routinely designed into a wider range of products than any other 32-bit processor. This wide applicability is made possible by the ARM architecture, resulting in optimal system solutions at the crossroads of high performance, low power consumption and low cost.

- To understand the embedded system based on ARM processor and itshardware (ARM processor Core).
- To understand the techniques and rules for writing efficient C code andoptimizing ARM assembly code.
- To discuss various Cache technologies and Architecture that surrounds theARM cores and MMU.
- To Understand the architecture of ARM CORTEX-M3

Course Outcomes:

Upon successful completion of this course student should be able to:

- Design an embedded system using ARM processor.
- Write source code that will compile more efficiently in terms of increasedspeed and reduced code size.
- Develop an embedded system with optimized key subroutines to reduce
- system power consumption and clock speed needed for real time operation

SKILLS ACQUIRED:

- 16/32 bit assembly language programming for ARM processor
- 16/32 bit C language programming for ARM processor
- Difference between RISC and CISC

ACTIVITIES:

1. Multi byte(32/64/128) addition by using arm assembly language/C
2. 64 bit multiplication by ARM assembly language/C
3. Keypad interfacing with ARM processor
4. LOAD and STORE operations (Address verifications)

UNIT –I **L09**

ARM Architecture

ARM Design Philosophy, Registers, Program Status Register, InstructionPipeline, Interrupts and Vector Table, Architecture Revision, ARM ProcessorFamilies.

UNIT –II **L09**

ARM Programming Model – I

Instruction Set: Data Processing Instructions, Addressing Modes, Branch,Load -Store Instructions, PSR Instructions, Conditional Instructions.

UNIT –III **L09**

Thumb Instruction Set: Register Usage, Other Branch Instructions, DataProcessing Instructions, Single-Register and Multi Register Load-StoreInstructions, Stack, Software Interrupt Instructions

UNIT –IV **L09**

ARM Programming

Simple C Programs using Function Calls, Pointers, Structures, Integer andFloating Point Arithmetic, Assembly Code using Instruction Scheduling,Register Allocation, Conditional Execution and Loops. Exception Handling ,Interrupts , Interrupt handling schemes, Firmware and boot loader.

UNIT –I **L09**

ARM Cortex-M3

ARM Cortex-M3 Processor –Architecture- Instruction Set Development-TheThumb-2 Technology and Instruction Set Architecture-CORTEX-M3Applications.

TEXTBOOKS:

17ES012 - Micro Electro Mechanical System

L	T	P	C
3	1	-	4

Course Description and Objectives:

This course is an introduction to Micro Electro Mechanical Systems and is intended for Post Graduate students. Silicon-based integrated MEMS promise reliable performance, miniaturization and low-cost production of sensors and actuator systems with broad applications in data storage, biomedical systems, inertial navigation, micromanipulation, optical display and micro fluid jet systems. The course covers such subjects as materials properties, fabrication techniques, Mechanical sensor packaging, mechanical transduction techniques, pressure sensors, Force, torque and internal sensors.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Understand the different materials-Substrates used in MEMS manufacture.
- To acquire knowledge on different fabrication techniques.
- To acquire different mechanical transduction techniques.
- Understand the different techniques used in pressure sensors and different types of pressure sensors.
- To understand the functional and usages of various sensors like, electro static thermal, force, torque and inertial sensors.
- To understand the functional and usages of various actuators like, electro static thermal and etc,.

SKILLS ACQUIRED:

- Understand future applications of MEMS.
- Be able to apply all these skills to the design of a MEMS system.
- The above can be applied to understand the design and fabrication of NEMS.

ACTIVITIES:

1. Design and Simulation of Inertia Sensors.
2. Design and Simulation of Pressure Sensors.
3. Design and Simulation of Electrostatic Actuators.
4. Design and Simulation of Piezo resistive Actuators.

Note: To perform the above mentioned activities FEM based MEMS design software tools like, Intellisuite / coventorware / Comsol Multi physics are required.

UNIT I: INTRODUCTION L-12

Intrinsic Characteristics of MEMS – Energy Domains and Transducers- Sensors and Actuators –- Silicon based MEMS processes – New Materials – Review of Electrical and Mechanical concepts in MEMS – Semiconductor devices – Stress and strain analysis –

Flexural beam bending- Torsional deflection, Broad response of MEMS to mechanical, thermal and electrical stimuli.

UNIT II: MICROMACHINING **L- 12**

Introduction to Micro fabrication –Photo lithography-Deposition techniques-Chemical vapour deposition, physical vapour deposition- Silicon Anisotropic Etching – Anisotrophic Wet Etching – Dry Etching of Silicon – Plasma Etching – Deep Reaction Ion Etching (DRIE) – Isotropic Wet Etching – Gas Phase Etchants –Basic surface micromachining processes – Structural and Sacrificial Materials

UNIT III : Electrostatic and Thermal Sensors And Actuators **L-12**

Electrostatic sensors – Parallel plate capacitors – Applications – Inter digitated Finger capacitor – Comb drive devices – Thermal Sensing and Actuation – Thermal expansion– Thermal couples – Thermal resistors – Applications

UNIT IV : Piezo-Resistive and Piezo-Electric Sensors And Actuators **L-12**

Piezoresistive sensors – Piezoresistive sensor materials - Stress analysis of mechanical elements – Applications to Inertia, Pressure, Tactile and Flow sensors – Piezoelectric sensors and actuators – piezoelectric effects – piezoelectric materials – Applications to Inertia,Tactile and Flow sensors.

UNIT V : POLYMER MEMS **L-12**

Polymers in MEMS– Polimide - SU-8 - Liquid Crystal Polymer (LCP) – PDMS – PMMA – Parylene – Fluorocarbon - Application to Acceleration, Pressure, Flow and Tactile sensors.

TEXTBOOKS:

17ES014 - DSP PROCESSORS

L	T	P	C
3	1	-	4

Course Description and Objectives:

Digital Signal Processing (DSP) is being used very widely in applications that include telecommunication equipment, multimedia systems, electronic and biomedical instrumentation, automotive systems and many military and weapon systems. DSP chips, general processors or dedicated ASIC chips, are now able to process wide bandwidth signal of all sorts in real-time.

The objectives of the course are:

- Architecture of a Real time Signal Processing Platform
- Digital Signal Processor Architecture
- Difference in the complexity of programs between a General PurposeProcessor and Digital Signal Processor
- Apply previous signal processing knowledge in real-time digitalsignal processing systems.
- Learn to program a DSP processor.
- Prepare students with multi disciplinary competency

Course Outcomes:

At the end of the course, students should be able to:

- Define digital signal processor (DSP)
- Comprehend performance enhancements provided by DSP in theareas: memory architecture, pipelining, parallel execution, cache use, direct memory access, addressing methods, hardware loop control etc.
- Different Errors introduced during A-D and D-A converter stage
- Develop tools and methods for DSP.

SKILLS ACQUIRED:

- Knowledge of signals and systems, convolution methods, digital signal processing concepts must be known.

ACTIVITIES:

- Implementation of CODEC interface circuit
- Implementation of sensors with DSP Processors
- FFT implementation on DSP Processor.

UNIT – I **L-09**

Architectures for Programmable Digital Signal Processing Devices Introduction, Basic Architectural Features, DSP Computational BuildingBlocks, Bus Architecture and Memory, Data Addressing Capabilities, AddressGeneration Unit, Programmability and Program Execution, Speed Issues, Features for External Interfacing.

UNIT – II **L-09**

Programmable Digital Signal Processors

Introduction, Commercial Digital Signal-processing Devices, Data AddressingModes of TMS320C54xx Digital Signal Processors, Data Addressing Modesof TMS320C54xx Processors, Memory Space of TMS320C54xx Processors,Program Control.

UNIT – III **L-09**

DSP Programming and Operations

TMS320C54xx Instructions and Programming, Programming for IIR, FIR, FFTetc., On-Chip peripherals, Interrupts of TMS320C54xx Processors, PipelineOperation of TMS320C54xx Processors.

UNIT – IV **L-09**

Interfacing Memory and Parallel I/O Peripherals to Programmable DSPDevices Introduction, Memory Space Organization, External Bus Interfacing Signals,Memory Interface, Parallel I/O Interface, Programmed I/O, Interrupts and I/O, Direct Memory Access (DMA)

UNIT – V **L-09**

Interfacing Serial Converters to a Programmable DSP Device

Introduction, Synchronous Serial Interface, A multi-channel Buffered SerialPort (McBSP), McBSP Programming, A CODEC Interface Circuit, CODECProgramming, A CODEC-DSP Interface Example.

TEXTBOOKS:

6. Lapsley et al., "DSP Processor Fundamentals, Architectures & Features", S. Chand & Co, 2000.
7. "Digital Signal Processing", A. Singh & S. Srinivasan, Thomson Learning.

REFERENCE BOOKS:

1. B. VenkataRamani and M. Bhaskar, "Digital Signal Processors, Architecture, Programming and Applications", TMH, 2004.
2. Jonatham Stein, "Digital Signal Processing", John Wiley, 2000
3. Embedded Dsp Processor Design Application Specific Instruction Set Processorsby LiuShroff (2008)

17ES016 - COMPUTER ARCHITECTURE AND PARALLELPROCESSING

L	T	P	C
3	1	-	4

Course Description and Objectives:

Includes the organization and architecture of computer systems hardware; instruction set architectures; addressing modes; register transfer notation; processor design and computer arithmetic; memory systems; hardware implementations of virtual memory, and input/output control and devices. This course covers the architecture and enabling technologies of parallel and distributed computing systems and their innovative applications. To understand the concepts of computer architecture. To understand the concepts of pipelined and parallel processing.

Course Outcomes:
Upon successful completion of this course student should be able to:

- Describe the principles of computer design
- Describe the operation of performance enhancements such as pipelines, dynamic scheduling, branch prediction, caches, and vector processors.
- Describe modern architectures such as Super Scalar, vector processors .
- Develop applications for high performance computing systems.

SKILLS ACQUIRED:
- *Understand the design and architectures of different systems*
- *Understand the concept of parallel processing*

Activities
- *design and Develop the architectures of different systems*

UNIT - I **L - 10**
Theory of Parallelism Parallel Computer models – the state of computing, Multiprocessors and Multicomputers and Multivectors and SIMD computers, PRAM and VLSI models, Architectural development tracks, Program and network properties – Conditions of parallelism.

UNIT - II **L - 10**
Partitioning and Scheduling Program partitioning and scheduling, Program flow mechanisms, System interconnect architectures, Principles of scalable performance – performance matrices and measures, Parallel processing pplications, speedup performance laws, scalability analysis and approaches.

UNIT - III **L - 10**
Hardware Technologies Processor and memory hierarchy advanced processor technology, superscalar and vector processors, memory hierarchy technology, virtual memory technology, bus cache and shared memory – backplane bus systems, cache memory organizations, shared memory organizations, sequential and weak consistency models.

UNIT - IV **L - 10**

Pipelining and Superscalar Technologies Parallel and scalable architectures, Multiprocessor and Multicomputers, Multivector and SIMD computers, Scalable, Multithreaded and data flow architectures.

UNIT - I **L - 10**

Software and Parallel Processing Parallel models, Languages and compilers, Parallel program development and environments, UNIX, MACH and OSF/1 for parallel computers.

TEXT BOOKS:

1. Kai Hwang "Advanced Computer Architecture". McGraw Hill International 2001

2. Carl Homacher, Zvonko Vranesic, Sefwat Zaky, "Computer Organisation", 5th Edition, TMH, 2002.

17ES018 - Robotics and Automation

L	T	P	C
3	1	-	4

Course Description and Objectives:

Automation, control and robotics are pervasive enabling technologies found in almost every modern technical system, particularly in manufacturing and production. They combine the diverse and rapidly expanding disciplines of automation, control, mechanics, software and signal processing.
This course is ideal if you wish to develop comprehensive knowledge and understanding of • classical and modern control theory • industrial automation • systems analysis • design and simulation • robotics.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Understand basic concepts of robotics.
- Enhances practical applications of sensors and actuators in robotic systems.
- Design and model robotic manipulator.
- Design and develop dynamic control systems with related to robotics

SKILLS ACQUIRED:

- *Ability to design robot model*
- *Ability to apply principles of modelling*
- *Ability to distinguish classical and modern control concepts and controller design packages in various areas of industry*
- *Ability to design and exploit automation and robotic systems in a range of manufacturing and industrial applications.*
- *Familiarization with machine vision for image processing applications with robot*

Activities:

1. *Design dynamics of robots*
2. *Calculation of torques and selection of motors*
3. *Selection of sensors*
4. *Integration of mechatronic systems*
5. *Motion planning and control*
6. *Design of a robot using CAD*

Unit – I **L12**

Introduction: Brief History - Past, Present status and Future trends in robotics - Uses of robots – Robot Anatomy: Overview of Robot subsystems - Concept of Workspace - Mechanisms and Transmission - Types of Robots - Issues in Designing and Controlling Robots: Resolution, Repeatability, Accuracy and Compliance.

Unit – II **L12**

Effectors: Different types of Grippers and Tools - Vacuum and other methods of gripping, Actuators: Pneumatic, Hydraulic and Electric Actuators – Sensors: Internal and External sensors - Position, Velocity and Acceleration Sensors - Proximity Sensors

- Force Sensors - Laser range finder - Camera. Micro-controllers, DSP, Real time operating systems.

Unit – III **L12**

Positions, Orientations and Frames - Mappings: Changing descriptions from frame to frame, Operators: Translations, Rotations and Transformations - Transformation Arithmetic - D-H Representation - Forward and Inverse Kinematics of Six DOF Robot Arm - Robot Arm dynamics.

Unit – IV **L12**

Robot Control: Independent joint control - PD and PID feedback - Actuator models - Nonlinearity of Manipulator models - Issues in nonlinear control - Force feedback - Hybrid control - Motion planning and Obstacle avoidance: Road map methods, Graph search algorithms, Potential field methods - Robot languages -.Computer Control and Robot software.

Unit –V **L12**

Robot Vision - Camera model and Perspective transformation - Image processing fundamentals for Robotic applications - Image acquisition and preprocessing - Segmentation and region characterization - object recognition by image matching and based on features - Problem of bin-picking - Futuristic topics in Robotics.

TEXT BOOKS:

17ES020 Cryptography and Network Security

L	T	P	C
3	1	-	4

Course Description and Objectives:

The objective of the course is to ensure that students have the necessary networking skills to design, implement, and analyze data communication networks.

Course Outcomes:

Upon successful completion of this course student should be able to:

To be able to understand the concepts of security in Networks
To be able to understand different attacks
To be able to analyze the given network and know its performance for various situations

SKILLS ACQUIRED:

Understand various Network attacks, Protocols
Understand the Internet threats
Analysation of the Different Protocols

Unit – I **L-14**

Introduction

Introduction, Services, Attacks, Security model, OSI security architecture and mechanisms, Internet standards and RFC, Buffering,

Unit – II

Encryption algorithms

Principles, Conventional algorithms, Key distribution, AES ,Diffie Hellman, N-parity Deffie Hellman, Elliptic curve and Elliptic curve cryptography,X.509 directory ,Authentication services, Hash functions secure hash

L-14

Unit - III

IP security

IP security overview , Architecture,IPV6 authentication header ,Encapsulation Security payload, ESP, Web security requirements.

L-12

Unit – IV

Transport layer security

SNMP, SNMPv1, SNMPv3, Intruders, Viruses, Threats , Secure Socket Layer and Transport Layer Security – Secure Electronic Transaction. SYSTEM SECURITY Intruders – Intrusion Detection – Password Management – Malicious Software - Firewalls – Trusted Systems.

L-12

Unit-V

Public Key Infrastructure

Digital Certificates, Private Key Management, The PKIX Model, Public Key Cryptography Standards, XML, PKI and Security. Internet Security Protocols: Basic Concepts, Secure Socket Layer, SHTTP, Time Stamping Protocol, Secure Electronic Transaction, SSL versus

SET, 3-D Secure Protocol, Electronic Money, E-mail Security, Wireless Application Protocol (WAP) Security, Security in GSM

Activities:

1. To create basic Networks and configure them
2. To check the robustness of networks on various attacks
3. To implement basic cryptographic Algorithms using open source tools

TEXTBOOKS:

1. Cryptography and Network Security – by Atul Kahate – TMH.

2. Data Communications and Networking- by Behourz A Forouzan

3. William Stallings, "Cryptography and Network security", 4th ed., Pearson Education, 2010.

4. William Stallings "Network Security Essentials Applications and Standards", 2nd ed.,Pearson Education, 2009**.**

2. Forouzan, "Data Communications and Networking", 4th Edition,McGraw Hill

3. William Stallings, "Data and Computer Communication", Eighth Edition, Pearson Education, 2000

17ES022 - SMART INSTRUMENTATION

L	T	P	C
3	1	-	4

Course Description and Objectives:

The evolution from simple pneumatic to sophisticated smart instruments has been driven by user demands for better performance, easier maintenance, and more uptime. Smart instruments have met these demands and more, albeit with increasing complexity. But once smart instruments are understood and deployed, the payoff is less complexity, better performance, and reduced costs throughout the balance of the process control and information system lifecycles. The course is extensively hands on, giving participants considerable practical experience of the devices typically found in industry.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Identify various sensors, Transducers and their brief Performance specifications.
- Understand principle of working of various types of signal contiditioning, processing and transmitter
- Make comparative study of various protocol.
- Understand applications of Instrumentation in Emmebedded system(Real Time Interface)

SKILLS ACQUIRED:

- *Evaluate the different types of errors*
- *Understand the design of sensors*
- *Understand the working and applications of transmitters*

ACTIVITIES:

- *Designing simple sensors*
- *Designing Transmitters of different type*

UNIT I **L - 12**

General concepts and terminology of measurement systems, static and dynamic characteristics, errors, standards and calibration.

UNIT II **L - 12**

Introduction, principle, construction and design of various active and passive transducers. Introduction to semiconductor sensors and its applications, Design of signal conditioning circuits for various Resistive, Capacitive and Inductive transducers and piezoelectric transducer.

UNIT III **L - 12**

Introduction to transmitters, two wire and four wire transmitters, Smart and intelligent Transmitters. Design of transmitters.

UNIT IV **L - 12**

Introduction to EMC, interference coupling mechanism, basics of circuit layout and grounding, concept of interfaces, filtering and shielding. Safety: Introduction, electrical hazards, hazardous areas and classification, nonhazardous areas, enclosures – NEMA types, fuses and circuit breakers. Protection methods: Purging, explosion proofing and intrinsic safety.

UNIT V **L - 12**

Field bus, Mod bus, GPIB, IEEE-488, VME, VXI, Network buses – Ethernet – TCP/IP protocols; CAN bus- basics, Message transfer, Fault confinement.

17ES024 - Wireless Communications and Networks

L	T	P	C
3	1	-	4

Course Description and Objectives:

This course provides
As wireless communication systems are fast replacing the wired communication systems studying the technologies of wireless communication and networks became more important.
· Aim of this course is to offer the knowledge in wireless communication technologies and networking of wireless devices

Course Outcomes:

Upon successful completion of this course student should be able to:

- To be able to appreciate the need and importance of wireless networks
- · Familiarity with protocols used for wireless environment in comparison with wired networks.
- Application of this knowledge to incorporate wireless network technologies into
- embedded devices..

SKILLS ACQUIRED:

- Good understanding of various wireless communication technologies for long range and short range communications

ACTIVITIES:

1. Creation of WLAN and other Network Topologies
2. Implementation of WLL

Unit – I **L-12**

Fundamentals of Wireless Communications

The concept of spread spectrum, Frequency hopping spread spectrum, Direct sequence spread spectrum, Multiple access Techniques for Wireless Communications, Generation of spreading sequences**.**

Unit – II **L-12**

Cellular Networks

Principles of Cellular Networks, First Generation Analog, Second Generation TDMA, Second Generation CDMA, 2.5 G Wireless Networks, Third Generation Systems, LTE

Unit – III **L-12**

Cordless, WiLL and Broadband Systems

Cordless systems, Paging system, Cellular Telephone system, The Cellular Concept-System Design fundamentals, Wireless local loop, IEEE 802.16 fixed broadband wireless access standard, Mobile IP, Wireless application protocol.

Unit – IV **L-12**
Wireless LANs
Infrared LANs, Spread spectrum LANs, Narrowband microwave LANs, IEEE 802 Protocol architecture, IEEE 802.11 Architecture and services, IEEE 802.11 Medium access control, IEEE 802.11 Physical layer

Unit – V **L-12**
Bluetooth
Bluetooth overview, Radio specification, Baseband specification, Link manager specification, Logical link control and adaptation protocol.

TEXTBOOKS:

1.William Stallings, “Wireless communications and Networking”, Prentice Hall,India

2. T S Rappaport, “Wireless Communications: Principles and Practice”, 2nd Edition, Prentice

Hall, India

I YEAR	COURSE CONTENTS FOR COMMON COURSES
II SEMESTER	**17HS001 Research Methods** **17HS002 Employment Orientation Program (EOP)**

17HS001 Research Methods

L	T	P	C
3	0	0	3

Objective of the Course:

Objective of the course is to enable research scholars to have a general understanding of research methods and application of statistical tools in the analysis and interpretation of findings and guidelines for report writing.

UNIT - I

Introduction: Nature and Importance of research, the role of business research, aims of social research, research process, types of research. Data Base: discussion on primary data and secondary data, probability and non-probability sampling techniques.

UNIT-II

Research design: Meaning of research design. Functions and goals of research design. Questionnaire and Schedule.

UNIT – III

Measurement and scaling concepts: Attitude measurement, levels of measurement and types of scales, criteria for good measurement. Measures of central tendency, measures of dispersion, measures of variation, Correlation and Regression. Statistical Inference. Tests of significance for small samples, t-test, Chi-Square test and ANOVA-one way and two way classifications. Discriminate analysis, cluster analysis, conjoint analysis

UNIT-IV

Technical Report Writing: Pre-writing considerations, Thesis writing, formats of report writing, Formats of publications in Research Journals. Technique of Interpretation, Precaution in Interpretation, Significance of Report writing, Different steps in writing Report, Layout of the Research Report, Types of Reports, Report Format, Typing Instructions, Oral Presentations.

UNIT-V

Research Ethics and Morals: Issues related to plagiarism, collaborative models and ethics, Acknowledgements. *Intellectual Property Rights:* copy rights.

17HS002 Employment Orientation Program

L	T	P	C
2	0	0	2

Preamble

It is common knowledge that students opting for the Masters Programme after B.Tech do so either because they have been unsuccessful in securing employment after their Bachelors or because they have not crystallized their career plan. Hence, students opting for M.Tech are found to be deficient not only in the technical knowledge but also in their communication skills and overall personality. There is a need to groom them and shape them into employable resources.

Program Objectives:

i. To impart employability skills to M.Tech. final students by honing their interpersonal and presentation skills.
ii. To equip them with the latest tools and techniques for effective communication through discussions, group work, presentation exercises, assignments, projects etc.
iii. To impart training for their overall personality development and shape them into confident, positive and ambitious professionals.

Course Contents

The course content, designed for 50 Hrs will comprise two modules:

- Communication skills & Overall personality improvement (10 * 2.5 = 25 Hrs)
- Pedagogy of Engineering Subjects & Making Project Presentations (10 * 2.5 = 25 Hrs)

Rationale for the Programme

On a more holistic view of higher education, the term "academic development" refers to development of multiple aspects of a student's personality under this EOP for M.Tech students, different types of development are envisaged like personal, interpersonal skills, career development and life planning. "Development" in the engineering education according to national accreditation bodies like NBA and NAAC is understood to happen through activities and programmes designed to improve the ability to work to teams, express themselves confidently to their peers and present their views boldly before an audience and get things accomplished through management of men and materials. This programme will improve student's overall communication skills and raise his/ her potential as an employee graduate.

About this Programme

The 50 Hrs course will be rolled out in two spells of 25 Hrs each with the help of in-house and invited experts. It is aimed at improving the presentation skills in general and teaching ability of the M.Tech students in particular. AFD will seek the cooperation of all the Deans, HoDs and senior professors as subject experts, mentors from the departments to provide the essential knowledge and skill inputs for the trainees so that the course outcomes can be realized.

Expected Outcomes:

Having gone through the 50 hrs rigorous training on presentation skills, pedagogy and overall personality grooming, the trainees will get equipped to face any interview confidently, make short and effective presentations during interviews and gain the confidence to handle engineering topics and perhaps also develop an aspiration for a career in teaching.

Assessment:
The trainees will be assessed for a total of 50 marks, which will be incorporated into the II year project marks. The summative assessment will be carried out by a special panel constituted for the purpose in consultation with the Dean, Evaluation and respective HoD.

- ✓ 5 Marks for attendance
- ✓ 5 Marks for formative assessment
- ✓ 40 Marks for summative assessment

I

YEAR

M.Tech.

MACHINE DESIGN

I SEMESTER

- 17MD001 - Advanced Mechanisms
- 17MD003 - Advanced Mechanics of Solids
- 17MD005 - Creep, Fatigue and Fracture Mechanics
- 17MD007 - Advanced Finite Element Analysis
- Elective Course - I
- Elective Course - II

II SEMESTER

- 17HS001 - Research Methods
- 17HS002 - Employment Orientation Program (EOP)
- 17MD002 - Computer Aided Design
- 17MD004 - Mechanical Vibrations
- 17MD006 - Design synthesis
- 17MD008 - Optimization techniques
- Elective Course - III
- Elective Course - IV

COURSE CONTENTS

I SEM & II SEM

17MD001 ADVANCED MECHANISMS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-	-	-	-

Course Description and Objectives:

The study of Kinematics of mechanisms are composed of one or more mechanisms, involves analysis of geometry of motion. Different components of any mechanism move relative to the each other following certain constraints to produce the desired motion. Kinematic analysis is of prime importance in design of mechanisms and machines.

For kinematic design of a mechanism analysis is done for positions of points on a solid body and the time derivatives of the position. The first derivative of position with respect to time is velocity, the second derivative is acceleration and further derivatives can be analyzed according to the design requirements. Similarly for angular position there is angular velocity and angular acceleration.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Understand common mechanisms that are used in machines in everyday life.
- Understand Mobility Criterion for Planar mechanisms and manipulators
- Understand various function generation methods like Rotocenter method, Overlay method, Velocity pole method
- Understand Synthesis of Four-bar Mechanisms for prescribed extreme values of the Angular velocity of driven link.
- Understand Analytical and graphical determination of Bobillier's Construction

SKILLS :

- Compute degrees of freedom in different types of mechanisms
- Determine velocity and acceleration at different points on links in a mechanism. Determine the D-H parameters which are indispensible in design of Industrial robots like PUMA
- Compute Jacobian matrix for plan serial manipulator

ACTIVITIES:

- Guiding a body through three distinct positions and four distinct positions.
- Construction of Bobiller curve graphically
- Construction of Hartmann's

UNIT –I

Cams: Definitions, Types of cams and followers, types of follower motion, generation of cam profiles for uniform velocity, uniform acceleration and simple harmonic motion. Maximum velocity and maximum acceleration, analysis of roller follower and circular cam with straight flanks.

UNIT –II

Gears: Friction wheels and toothed gears- types-law of gearing, condition of constant velocity ratio for transmission of motion- cycloidal and involute teeth profiles, velocity of sliding-interference -condition for minimum number of teeth to avoid interference-expressions for arc of contact and path of contact.

UNIT –III

Laws of kinematic friction , friction of a body lying on a rough inclined plane, efficiency of inclined plane , screw friction , screw jack , torque required to lift and lower the load by screw jack , efficiency of screw jack, over hauling and self-locking screws , efficiency of self-locking screws.

UNIT –IV

Introduction to control system , types of control system , block diagrams , lag in response , transfer function, overall transfer function , transfer function with viscous damped output , open and closed transfer function

UNIT – V

Manipulator kinematics:D-H notation, D-H convention of assignment of co-ordinate frames and link parameters table; D-H transformation matrix ; Direct and Inverse kinematic analysis of Serial manipulators: Formulation of Jacobian series for planar serial manipulator

17MD003 ADVANCED MECHANICS OF SOLIDS

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	36	-	-	-	-	-	-

Course Description and Objectives:

To analyze and predict the mechanical behavior of deformable solid bodies like beams; columns; plates and non circular shafts using techniques of engineering mechanics and applied mathematics.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Understand the concept of unsymmetric bending and find the deflection of beams undergoing unsymmetrical bending and location of the shear centre of given cross section.
- Evaluate the shear stress distribution of non circular shaft and determination of torque transmitted of a solid or hollow thin walled shaft of any cross section.
- Design the structures of rail roads etc. using the concept of elastic foundation; long; and short beams.
- Design and Analyze curved beam structures.

SKILLS :

Unsymmetrical bending and Shear Centre torsion of non-circular shafts.

- Design of Rotating Discs
- Beams on Elastic foundation
- Design of Rotating Discs
- Curved Beam Theory

ACTIVITIES:

- *Design of C clamp for Crane*
- *Evaluate the shear center location for a given thin wall section*
- *Analyze stress induced in rotating discs of a rotar system*

UNIT – I

UNSYMMETRICAL BENDING AND SHEAR CENTRE

Introduction; product of inertia – parallel axes theorem for product of inertia – principal axes and principal moments of inertia; bending stresses in beams due to unsymmetrical bending; deflection of straight beams due to unsymmetrical bending. Concept of shear center; determination of shear center for symmetrical and unsymmetrical sections.

UNIT – II

TORSION OF NON CIRCULAR SHAFTS

Introduction; Membrane Analalogy; torsion of non-circular solidsections; thin wall tubular sections; thin-walled multi-cell sections.

UNIT – III

BEAMS ON ELASTIC FOUNDATION

General theory; infinite beam subjected to concentrated load at its end boundary conditions; infinite beam subjected to a distributed load; semi-infinite beam with point load near its end; short beams.

UNIT – IV

DESIGN OF ROTATING DISCS

Introduction to Centrifugal stresses- Rotating ring; flat discs-Disc of uniform thickness and Disc of uniform strength.

UNIT – V

CURVED BEAM THEORY

Winkler bach formula for circumferntial stresses – Limitations; corrections factors – Radial stress in curved beams – closed rings subjected to concentrated and uniform loads.

17MD005 CREEP, FATIGUE AND FRACTURE MECHANICS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

The course helps us understanding the most common failure modes. Understanding the modes of failure is the most fundamental necessity of designing machine elements. Whenever we are dealing with cyclic loading at elevated temperatures, the failure occurs much less than the static strength. Such failure mode is known as creep. It will be elaborately discussed in this subject. Small crack tends to propagate whenever they are subjected to cyclic loading. For understanding these phenomena we need to understand the concepts of fracture mechanics. This course aims to provide basic insights in such areas

Course Outcomes:

Upon successful completion of this course student will be able to:

- Understand the effect of stress concentrators and flaws in cyclic loading.
- Acquire clear insight on linear elastic fracture mechanics, Elastic- Plastic fracture mechanics.
- Predict the fatigue life under given conditions Gain insights on fatigue of welded structures
- Design machine elements considering the effect of creep, fatigue and fracture.

SKILLS:

- Calculation of energy release rate Calculation of stress intensity factor
- Calculation of effective crack length Prediction of effect of overload
- Prediction of the effect of stress on creep curves

ACTIVITIES:

- *Evaluate stress intensity factors of surface cracks of the specimens prepared from casting and various types of welding.*

UNIT – I

Theoretical cohesive strength of metals – Ductile brittle transition of metals - Ductile fracture - Brittle fracture.

Modes of fracture failure - Early concepts of stress concentrators and flaws. Inglis solution to stress round an elliptical hole - Surface energy – Griffiths analysis - Energy release rate - Crack resistance - Stable and Unstable crack growth - R-Curve.

Stress intensity factor for a crack. Stresses and displacement in Cartesian and polar coordinates. Critical stress intensity factor - K_{1C} testing.

UNIT – II

Linear Elastic fracture mechanics - Elastic plastic fracture mechanics - Plastic zone shape for plane stress and plane strain – Effective crack length – Irwin plastic zone correction – Dugdole approach - Effect of plate thickness.

Elastic plastic analysis through J – Integral - Path Independence – J_{1C} testing. Crack tip opening displacement

UNIT – III

FATIGUE : Importance of Fatigue in engineering applications – Low cycle fatigue – Coffin Mansonrelation – Strain life equation – Structural features of fatigue – Fatigue crack propagation – High cycle fatigue – Basquin's law. Cumulative fatigue damage.

Effect of Metallurgical variables on fatigue – Design for fatigue –Corrosion fatigue – Effect of temperature on fatigue.

UNIT – IV

Crack growth and application of fracture mechanics to fatigue. Paris erdogan law – Effect of an overload – Crack closure – Variable ampliture fatigue load. Cycle counting methods – Reservoir Method – Rainflow Method.

Fatigue of welded structures – Factors affecting the fatigue lives of welded joints.

UNIT – V

CREEP: Time dependent mechanical behaviour – Creep curve – Effect of stress on creep curves – Stress rupture test – Structural changes during creep – Creep under combined stresses – Creep fatigue interaction.

TEXT BOOKS:

17MD007 ADVANCED FINITE ELEMENT ANALYSIS

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course explores the fundamental concepts of finite element method to find the approximate solutions of various field problems. The objective of this course is to emphasize analysis and provide solutions using FEM for thermal and structural problems.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Understand the concept of plane stress and plane strain.
- Recognize the behavior and usage of each type of elements covered perform numerical integrations in FE methodologies.
- Analyze and solve field problems using appropriate packages.

SKILLS:

- Convert partial differential equations to linear algebraic equations. Implement energy method concepts to solve beam problems. Identify displacements, stresses of 1D structural problems
- Formulate iso-parametric elements.
- Provide solutions for thermal and structural problems.

ACTIVITIES:

- o Solve 1D problems in bars.
- o Solve 2D problems in structures visualized as assembly of springs
- o Solve beam problems
- o Solve vibration problems
- o Solve heat transfer in fins problems

UNIT – I

Introduction- comparison of various FEA methods (Weight Residual, Displacement approach, Potential Energy approach, Galerkin approach, Virtual work approach, Rayliegh Ritz approach), Mathematical preliminaries of variational formulations and integral formulations.

UNIT – II

Second – order differential equation in 1-D: Finite element models Basic steps of FEA for a boundary value problem, Applications in solid mechanics, heat transfer and fluid mechanics.

UNIT – III

FEA applications: Plane trusses, Euler – Bernoulli Beam Elements, Application problems.

UNIT – IV

Dynamic considerations : Formulation for point mass and distributed masses, element mass matrix ofone dimensional Bar element. Eigen vectors, Applications to Bars, Stepped Bars. Natural Frequencies, mode shapes

UNIT – IV

Single variable problems in 2-D: Introduction to Boundary Value Problems (BVP). Solution of plane stress and plane strain problems, Conductive and convective heat transfer using triangular elements.

Objective of the Course

Objective of the course is to enable research scholars to have a general understanding of research methods and application of statistical tools in the analysis and interpretation of findings and guidelines for report writing.

UNIT - I

Introduction: Nature and Importance of research, the role of business research, aims of social research, research process, types of research. Data Base: discussion on primary data and secondary data, probability and non-probability sampling techniques.

UNIT-II

Research design: Meaning of research design. Functions and goals of research design. Questionnaire and Schedule

UNIT – III

Measurement and scaling concepts: Attitude measurement, levels of measurement and types of scales, criteria for good measurement. Measures of central tendency, measures of dispersion, measures of variation, Correlation and Regression. Statistical Inference. Tests of significance for small samples, t-test, Chi-Square test and ANOVA-one way and two way classifications. Discriminate analysis, cluster analysis, conjoint analysis

UNIT-IV

Technical Report Writing: Pre-writing considerations, Thesis writing, formats of report writing, Formats of publications in Research Journals. Technique of Interpretation, Precaution in Interpretation, Significance of Report writing, Different steps in writing Report, Layout of the Research Report, Types of Reports, Report Format, Typing Instructions, Oral Presentations.

UNIT-V

Research Ethics and Morals: Issues related to plagiarism, collaborative models and ethics, Acknowledgements. *Intellectual Property Rights:* copy rights.

17MD002 COMPUTER AIDED DESIGN

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To impart fundamental knowledge to students in the latest technological topics on Computer Aided Design, Computer Aided Engineering Analysis and to prepare them for taking up further research in the areas

Course Outcomes:

Upon successful completion of this course the student will be able to:

- Apply the concept of CAD in developing solutions or to do research in the areas of Design and simulation in Mechanical Engineering.
- Have abilities and capabilities in developing and applying computer software and hardware to mechanical design and manufacturing fields.
- Review and document the knowledge developed by scholarly predecessors and critically assess the relevant technological issues.
- Design and validate technological solutions to defined problems and communicate clearly and effectively for the practical application of their work.

SKILLS :

- Model a Part.
- Create an assembly of part. Create a detailed drawing.
- Use parametric 3D CAD software tools.
- Redesign in CAD and evaluate a mechanical product by making components in the mechanical workshop for design validation.
- Able to exchange data in different format for different software packages.

UNIT – I COMPUTER AIDED DESIGN

Introduction, Need of CAD, conventional design v/s CAD, CAD system architecture,Hardware and software for CAD. Role of computer in CAD, CAD Module,

Raster scan graphics: Line drawing algorithms – DDA & Bresenham algorithms, circle generation algorithms, displaying lines.

UNIT – II UNIT-II GEOMETRIC TRANSFORMATIONS

2D and 3D; transformations of geometric models like Translation,Scaling, Rotation, Reflection, Shear; Homogeneous Representations, Concatenated Representation;

LINE CLIPPING: Simple visibility algorithm, Cohen-Sutherland subdivision line clipping algorithm, midpoint sub division algorithm.

UNIT – III MATHEMATICAL REPRESENTATION OF CURVES

Curve representation, parametricrepresentation of analytic and synthetic curves

MATHEMATICAL REPRESENTATION OF SURFACES

Surface models, Surface representations, parametric representation of analytic and synthetic surfaces.

UNIT – IV MATHEMATICAL REPRESENTATION OF SOLIDS

Solid models, Classification ofmethods of representations, boundary representation, CSG, sweep representations.

ASSEMBLY MODELLING

Representation, mating conditions, representation schemes, Assembly Modelling Methods: Top-down Approach & Bottom-up

UNIT – V OVERVIEW OF MODELLING SOFTWARE

Like Solid Works, Autodesk Inventor, AutoCAD, PRO/E, CATIA: Capabilities, Modules, Coordinate Systems, Sketching Tools, Solid Modeling Tools, Surface Modeling Tools, expression/parameters toolbox, Data Exchange standards like IGES, STEP, Model storage.

LIST OF EXPERIMENTS:

The following wire frame surface and solid models can be created by using any commercial modelling package (CREO, SOLID WORKS, CATIA, Etc.)

1. Practice of Orthographic/ Isometric Projections.
2. Creation of Surface Models.
3. Creation of solid models.
4. Assembling of Mechanical CAD components
5. Simulation of assembly models

17MD004 MECHANICAL VIBRATIONS

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-	-	-	-

Objectives

A course in linear and non-linear mechanical vibrations where students acquire the ability to

- Formulate mathematical models of problems in vibrations using Newton's second law or energy principles
- Determine a complete solution to mechanical vibration problems using mathematical or numerical techniques
- Determine physical and design interpretations from the results

Outcomes:

Students will be able to

- Construct the equations of motion from free-body diagrams.
- Solve for the motion and the natural frequency of free vibrations of (single degree of freedom) damped and undamped motion.
- Construct the governing differential equation and its solution for a vibrating mass subjected to an arbitrary force.
- Solve for the motion and the natural frequency of forced vibrations of (single degree of freedom) damped and undamped motion.
- Obtain the complete solution for the motion of a single degree of freedom vibratory system (damped or undamped) that is subjected to non-periodic forcing functions.
- Solve vibration problems that contain multiple degrees of freedom.
- Obtain design parameters and indicate methods of solution for a complicated vibratory problem. Solve non-linear vibration problems

Skills:

- Analyze single and multiple DOF system problems
- Effectively utilize energy methods
- Estimate modes and mode shapes of vibratory systems
- Analyze non-linear vibratory systems
- Explain different vibration measurement instruments

UNIT – I **8 hr**

Single Degree of Freedom Systems: Equation of motion, Natural Frequency, Energy method, Rayleigh method, Viscously damped free vibration, damping models, underdamped, overdamped and critically damped vibrations, Logarithmic decrement, Forced harmonic vibrations, Magnification factor, Rotor unbalance, Transmissibility, Vibration Isolation, Equivalent viscous damping, Sharpness of resonance.

UNIT – II **12 hr**

Two Degrees of Freedom Systems: Generalized and Principal coordinates, derivation of equations of motion, Semi-definite system, Lagrange's equation, Coordinate coupling, Forced Harmonic vibration, Vibration absorber, Tuned absorber and damped absorber, determination of mass ratio.

UNIT – III **10 hr**

Multi Degrees of Freedom Systems: Derivation of equations of motion, influence coefficient method, flexibility and stiffness matrices, Maxwell reciprocal theorem, Modal analysis: undamped and damped systems, Calculation of natural frequencies: Matrix method, Matrix iteration method, Stodola method, Holzer method, Dunkerley method, Rayleigh method, Torsional vibration: Simple systems with one or two rotor masses, Geared rotor system.

UNIT – IV **8 hr**

Continuous systems: Closed form solutions, Vibration of strings, Longitudinal and torsional vibration of rods, Transverse vibration of beams: equations of motion and boundary conditions, Transverse vibration of beams: natural frequencies and mode shapes Continuous systems: Approximate solutions, Rayleigh method, Rayleigh-Ritz method, Galerkin method.

UNIT – V **10 hr**

Vibration Measurement: Vibration measurement system, Vibration transducers: working of displacement transducer, vibrometer, accelerometer; Signal amplifiers, Signal processing: FFT, windowing in FFT, vibration signature analysis, predictive maintenance.

EXPERIMENTS:

1. Determination of natural frequency of single DOF systems
2. Determination of damped natural frequency of vibration of the vibrating system with different viscous oils.
3. Determination of steady state amplitude of a forced vibratory system.
4. Static balancing using steel balls.
5. Determination of the magnitude and orientation of the balancing mass in dynamic balancing.
6. Field balancing of the thin rotors using vibration pickups.
7. Determination of the magnitude of gyroscopic couple, angular velocity of precession, and representation of vectors.
8. Determination of natural frequency of given structure using FFT analyzer.

17MD006 DESIGN SYNTHESIS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-	-	-	-

Course Description and Objectives:

Success of a product depends on many factors. They are cost , reliability, safety and simplicity in the product. With the globalization , manufacturers need to adopt high end techniques to remain competent in the current market. It is only possible by adopting methods to reduce time for design and reliable product design , reduction of number of sub assemblies, enhancement in quality with better manufacturing techniques. The basic objective of this course is to acquire the concepts of the product design process and integrating design for manufacturing and design for assembly to arrive at a good quality product in a cost effective way.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Analyze various stages involved in the design process
- Apply tolerances and surface finish to design a product
- Select a manufacturing process for different types of components
- Design the product keeping in view assembly , dismantling, maintenance and inspection Apply optimization methods for design problems

SKILLS :

1. Need identification and market survey techniques
2. Concept generation and evaluation
3. Manufacturing technique selection based on product
4. Product design based on ergonomics
5. Designing products based on maintenance and inspection

UNIT–I

Design process – Considerations of a Good design – Detailed description of design process – Need identification - Concept Generation – Decision making and concept selection - Embodiment design– Standardization and its application in design.

UNIT–II

Material selection – Performance characteristics of materials – Material selection process

Tolerances from process and function - Interchangeability and selective assembly - Selection off its for different design situations - Surface finish.

StrengthConsiderations inproductdesign -Strengthbaseddesign–Rigiditybaseddesign Designingforuniformstrength.Lightweightandrigidconstructions.

UNIT–III

Design for Manufacturing –Design of cast, forged, sheet metal parts and welded constructions. Design for Machining - Design for turning – Design for drilling – Design for milling

UNIT–IV

Design for assembly and dismantling - Design for inspection and maintenance – Design for fasteners. Ergonomic considerations in design - Design of controls and displays.

Modern approaches to product design – Concurrent design – Quality function deployment - rapid prototyping.-

Liquid, solid and powder based techniques.

UNIT–V

Optimization in design – Engineering applications of optimization -Problem formulation for design optimization - Classification of optimization problems - Linear programming – Non linear programming - Geometric programming - Application to machine design problems.

TEXT BOOKS:

1. GeorgeE.Dieter, “Engineering Design - A Materials & Processing Approach”, 4thEdition, Mc Graw Hill Publishers, 2015
2. S.S.Rao,”Engineering Optimization”,4thEdition,John Willey & Sons, 2009.

REFERENCE BOOKS:

1. Kevin Otto, Kristion Wood, ”Product Design”, 1st Edition, Pearson Publications, 2006.
2. A.K.Chitale, R.C.Gupta, “Product design and Manufacturing”, 3rd Edition, PHI Publications,

ACTIVITIES:

- Preparation of market survey for a new automobile design.
- Concept generation and evaluation for a domestic electric appliances like refrigerator, washing machine , sewing machine etc.
- Ergonomic design for a machine tool keeping controls and levers
- House of quality preparation for an industrial product.
- Optimum design of gear box for automobile application.

17MD008 OPTIMIZATION TECHNIQUES

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-	-	-	-

Course Description and Objectives:

Optimization is the process of obtaining the best result under given circumstances. In design, construction and maintenance of any engineering system, engineers have to take many technological and managerial decisions at several stages. The ultimate goal of all such decisions is either to minimize the effort required or to maximize the desired benefit. A number of optimization methods have been developed for solving different types of optimization problems. This course is designed to familiarize the students with the modeling of mechanical engineering systems and obtaining the optimum solution.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Formulate optimization problems;
- Apply the concept of optimality criteria for various type of optimization problems;
- Solve various constrained and unconstrained problems in single variable as well as multivariable;
- Apply the methods of optimization in real life situation.

SKILLS:

- To identify and resolve real life optimization problem the knowledge about various optimization techniques
- To know about various nontraditional optimization techniques like Genetic algorithm, Fuzzy Logic, ANN

PRE REQUISITE:

Before opting for this subject the student should have sound knowledge on Linear Algebra

Solution of systems of Linear equation Calculus

UNIT-I

Introduction &Linear Programming Problem:

Introduction: Terminology, Design Variables, Constraints, Objective Function, Problem Formulation. Engineering applications of optimization, classification of optimization problems.

Linear Programming Problem: :Standard formof linear programming (LP) problem, Canonical form of LP problem, Elementary operations, Graphical method for two variable optimization problem, Simplex method, Applications of linear programming, Two-phases of simplex method, Big-M method.

UNIT-II

Application of LPP

Transportation Problems: Definition, Formulation, IBFS of TP, Optimality test for transportation Problem.

Assignment Problem: Definition, Formulation, mathematical Modelling of AP, Hungarian method to solve AP, Special Cases in AP- Restricted Assignment, Maximization type, Travelling Salesman Problem.

UNIT-III

Non-Linear Programming Problem

Single Variable objective function with or without constraints: Optimality Criterion, Interval Halving Method, Fibonacci Search Method, Golden Section Method. Gradient Based Methods: Newton-Raphson Method, Bisection Method, Secant Method.

UNIT-IV

Non-Linear Programming Problem

Multi Variable objective function with or without constraints: Solution by method of constrained variation method of Lagrange multipliers, Kuhn – Tucker conditions, Univariate method Pattern Direction, Gradient of a function, Steepest descent method, Newton's method.

UNIT-V

Non – traditional optimization algorithms: Genetic algorithms(GA) – working principle, reproduction, crossover, mutation, advanced GA operators. GA for constrained optimization, multi-modal function optimization.

Simulated annealing, working principle, Metropolis algorithm, differences and similarities between conventional and non-conventional algorithms. Introduction to Neural networks and fuzzy logics as optimization tool.

TEXT BOOKS:

1. S.S.Rao,"Engineering Optimization", 3rd Edition, New Age Publishers, 2008.
2. Kalyanmoy Deb,"Optimization for Engineering Design",1st Edition,PHI Publishers, 2009.

REFERENCE BOOKS:

1. Jasbir Arora,"Optimal Design",McGrawHill (International) Publishers.
2. D.E.Goldberg, "Genetic algorithms in Search, Optimization and Machine Learning",1st Edition, John Wiley Publishers, 2009

Activities:

1. Find the dimension of a beam of rectangular CS to be cut from a log having a circular cross-section of diameter a. The beam has to be used as a cantilever beam to carry a concentrated load at the free end. Find the dimension of the beam that corresponds to the maximum bending stress carrying capacity.
2. A traveling saleswoman has to cover n towns. She plans to start from a particular town numbered 1, visit each of the other n-1 towns before returning to the distance between towns I and j given by . Formulate the problem of selecting sequence in which the towns are to be visited to minimize the total distance traveled.

17HS002 EMPLOYMENT ORIENTATION PROGRAM

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description

It is common knowledge that students opting for the Masters Programme after B.Tech do so either because they have been unsuccessful in securing employment after their Bachelors or because they have not crystallized their career plan. Hence, students opting for M.Tech are found to be deficient not only in the technical knowledge but also in their communication skills and overall personality. There is a need to groom them and shape them into employable resources.

Course Objectives:

i. To impart employability skills to M.Tech. final students by honing their interpersonal and presentation skills.

ii. To equip them with the latest tools and techniques for effective communication through discussions, group work, presentation exercises, assignments, projects etc.

iii. To impart training for their overall personality development and shape them into confident, positive and ambitious professionals.

Course Contents

The course content, designed for 50 Hrs will comprise two modules:

- Communication skills & Overall personality improvement (10 * 2.5 = 25 Hrs)
- Pedagogy of Engineering Subjects & Making Project Presentations (10 * 2.5 = 25 Hrs)

Rationale for the Programme

On a more holistic view of higher education, the term “academic development” refers to development of multiple aspects of a student’s personality under this EOP for M.Tech students, different types of development are envisaged like personal, interpersonal skills, career development and life planning. “Development” in the engineering education according to national accreditation bodies like NBA and NAAC is understood to happen through activities and programmes designed to improve the ability to work to teams, express themselves confidently to their peers and present their views boldly before an audience and get things accomplished through management of men and materials. This programme will improve student’s overall communication skills and raise his/ her potential as an employee graduate.

About this Programme

The 50 Hrs course will be rolled out in two spells of 25 Hrs each with the help of in-house and invited experts. It is aimed at improving the presentation skills in general and teaching ability of the M.Tech students in particular. AFD will seek the cooperation of all the Deans, HoDs and senior professors as subject experts, mentors from the departments to provide the essential knowledge and skill inputs for the trainees so that the course outcomes can be realized.

Expected Outcomes:

Having gone through the 50 hrs rigorous training on presentation skills, pedagogy and overall personality grooming, the trainees will get equipped to face any interview confidently, make short and effective presentations during interviews and gain the confidence to handle engineering topics and perhaps also develop an aspiration for a career in teaching.

Assessment:

The trainees will be assessed for a total of 50 marks, which will be incorporated into the II year project marks. The summative assessment will be carried out by a special panel constituted for the purpose in consultation with the Dean, Evaluation and respective HoD.

- 5 Marks for attendance
- 5 Marks for formative assessment
- 40 Marks for summative assessment

17MD009 MECHANICS OF COMPOSITE MATERIALS

Hours Per Week :

L	T	P	C
2	-	-	2

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and objectives:

Composite materials are being increasingly used in engineering structures as load bearing elements. The main objective of this subject is to provide knowledge about stress distribution, calculation of stresses, stress transfer and failure theories associated with fiber reinforced composite laminates. The extent of the material science information required to reach this objective is also covered in the content.

Course Outcomes:

Upon successful completion of the course student will be able to:

- Understand the basic elements in a composite and the difference between various types of composites.
- Suggest the suitable type of composite materials for given applications.
- Acquire knowledge on failure theories used in composite analysis.
- Apply the concepts of hygro-thermal stresses and ways to minimize these stresses.
- Analyze the damage progression in the laminate

Skills:

- Estimation of the composite properties from the constituent element properties.
- Acquire knowledge on laminates and the dependence of laminate properties on stacking sequence.
- Laminate strength calculation.
- Estimation of the variation of the laminate elastic/rength
- characteristics with off-axis angles.
- Characterization of the lamina and laminate

UNIT- I

Introduction, classifications of composites, particulate composites, fiber composites, sandwich structures, applications, geometric andphysical definitions, classification of fibers, classification of matrices, types and classification of FRPs, applications, production methods.

UNIT-II

Micromechanics and macromechanics, stress strain diagrams, fiber, matrix, composite. Micro mechanical estimation of elastic properties of lamina, different modes of failures, factors influencing the strength and stiffness, experimental characterization of composites.

UNIT-III

Hooke's law for orthotropic materials, relations between engineering constants and elements of stiffness and compliance matrices, restrictions on elastic constants, stress strain relations for lamina with arbitrary orientation, transformation of engineering constants.

UNIT-IV

Strength of an orthotropic lamina subjected to biaxial stress field, theories of failures, failure envelop, importance of sign of shear stress on strength of composites, multi directional laminates, stress - strain relations, load deformation relations, different types of laminates, compliances, laminate engineering properties.

UNIT-V

Stress analysis and safety factors for first - plyfailure of laminates, computational procedure for stress and failure analysis of general multidirectional laminates, hygrothermal stresses micromechanics of progressive failure, stiffness reduction, ultimate laminate failure, inter laminar stresses, edge effects.

TEXT BOOKS:

1. Isaac and M Daniel, "Engineering Mechanics of Composite Materials", 2^{nd} Edition, Oxford University Press,2006.

REFERENCE BOOKS:

2. R.M.Jones,"Mechanics of Composite Materials", 2^{nd}Edition,Taylor and Francis Publications, 1999.

Activities:

Calculation of the principle stresses from body coordinate stresses. Transformation of stresses from on-axis to off-axis or vice versa.

17MD011 PRESSURE VESSEL DESIGN

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Objective and Description:

Pressure vessel design involves fundamentals of various component designs. This subject provides basic knowledge required for an engineer to design and to analyze the behaviour of pressure vessels.

Course Outcomes:

Upon successful completion of the course student will be able to:

- Understand the basic concepts of pressure vessels.
- Suggest the suitable type of pressure vessels for given applications.
- Acquire knowledge on failure theories used in pressure vessel design.
- Apply the concepts of principal stresses and ways to minimize these stresses.
- Analyze the damage progression in pressure vessel.

Skills:

- Estimation of stresses build in pressure vessel.
- Acquire knowledge on failure modes of pressure vessel.
- Design pressure vessel.

UNIT-I

Introduction: Material - shapes of Vessels - stresses incylindrical, spherical and arbitary, shaped shells. Cylindrical Vessels subjected to internal pressure, windload, bending and torque - relation of pressure vessels - conical and tetrahedral vessels.

UNIT-II

Cylinders and plates: Shrink fit stresses in built up cylinders - auto frettage of thick cylinders. Thermal stresses in Pressure Vessels. Plates subjected to pure bending with different edge conditions. Circular plates withsimplysupported and clamped ends subjected toconcentrated and uniformly distributed loads, stresses, Design of domebends, shell connections, flat heads and cone openings.

UNIT-III

Discontinuity stresses in pressure vessels: Introduction, beam on an elastic foundation, indefinitely long beam, semi infinite beam, cylindrical vessel under axially symmetrical loading, extent and significance of load deformations on pressure vessels, discontinuity stress in vessels, stress in a bimetallic joints, deformation and stress in flanges. Pressure vessel materials, ductile material tensile tests, structure and strength of steel, Leuder's lines, determination of stress patterns behaviour of steel beyond the yield point, effect of cold work or strain hardening on the physical properties of pressure vessel steels.

UNIT-IV

Fatigue of metals: fatigue crack growth, fatigue life prediction, cumulative fatigue damage, stress theory of failure of vessels subject to steady state and fatigue conditions. Influence of surface effects on fatigue, effectofthe environment and other factors on fatigue life, thermal stress fatigue, creep and rupture of metals at elevated temperatures, hydrogen embrittlement of pressure vessel steels, brittle fracture, effect of environment on fracture toughness,fracture toughness relationships, criteria for design with defects, significance of fracture mechanics evaluations, effect of warm prestressing on the ambient temperature toughness of pressure vessel steels.

UNIT-V

Design features: Localized stresses and their significance, stress concentration at a variable thickness transition section in a cylindrical vessel, stress concentration about a circular hole in a plate subjected to tension, elliptical openings, stress concentration factors for position, dynamic and thermal transient conditions, theory of reinforced openings, reinforcement, placement and shape, fatigue and stress concentraction.

2. Henry H.Bednar, "Pressure Vessel Design Hand Book", 2nd Edition, Krieger Publishing Co., 1991.

Activities:

Calculation of the principle stresses from body coordinate stresses. Transformation of stresses from on-axis to off-axis or vice versa.

17MD013 THEORY OF PLASTICITY

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Objectives:

- To understand the concepts of stresses, strains and stress-strain relationships, as well as Yield and failure criteria.
- To provide the knowledge of various theoretical elements of plasticity and establish plasticity models for metallic structures.
- To apply the principles of the theory of plasticity for large deformations in nonlinear analysis of structures.

Learning Outcomes:

After the completion of this course, students will be able to:

- Describe the elastic and plastic behaviour from stress-strain curves for materials;
- Recognize typical plastic yield criteria established in constitutive modeling;
- Understand the physical interpretation of material constants in mathematical formulation of constitutive relationship;
- Solve analytically the simple boundary value problems with elasto-plastic properties;
- Develop constitutive models based on experimental results on material behavior.

Skills:

- Derive the equations in the theory of plasticity for large deformations and apply established plasticity models in the analysis of metallic structures.
- Identify material parameters from laboratory experiments, and implement plasticity models in the nonlinear analysis of mechanical structures.

UNIT-I

Introduction : Uniaxial behavior in plasticity, Index notation, Cartesian tensors, Yield and failure criteria, stress deviator tensors, invariants principal stresses, mean stresses, Elastic strain energy, Mohr's representation of stress in 2&3 dimensions, Haigh-wester gaard stress space, Yield criteria: Tresca & von Mises rules, Drucker - prager criterion, anisotropic yield criteria.

UNIT-II

Strain at point:Cauchy's formula for strains, principal strains, principal shear strains, derivative strain tensor, Strain - displacement relationships, Linear elastic stress strain relations, generalized Hooke's law, nonlinear elastic stress strain relations, principle of virtual work and its rate forms.

UNIT-III

Criteria for loading and unloading: Elastic and plastic strain increment tensors, plastic potential and flow rule associated with different Yield criteria, Convexity, normality and uniqueness considerations for elastic - plastic materials, Expansion of thick walled cylinder.

UNIT-IV

Incremental stress strain relation: Prandtl-Reuss material model, Flow plasticity theory, J_2deformation theory, Drucker-prager material, General Isotropic materials.

UNIT-V

Deformation theory inplasticity: Loading surface, Hardening rules, Flow rules and Druckers stability postulate, effective stress and effective strain, mixed hardening material.

TEXT BOOKS:

1. L. M. Kachanov, "Fundamentals of the Theory of Plasticity", 4th edition, Dover Publications, 2004.
2. Dr.Sadhu Singh,"Theory of Plasticity", 2nd Edition,Khanna Publications,1990.

1. J.Chakrabarty,"Theory of Plasticity",3rd Edition, Elsevier Publications, 2006.
2. Dr.Sadhu Singh,"Theory of Plasticity & Metal forming process", 3rd Edition, Khanna Publications, 1999.

ACIVITIES:

1. Equal Channel Angular Press (ECAP) test of an aluminium billet through an 90 degree channel;
2. Strain hardening test of a metal (aluminium) after large plastic deformation

17MD015 DESIGN AND METALLURGY OF WELDED JOINTS

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

Welding is one most the most commonly used fabrication techniques. For successful application of welding to produced sound weld joints, it is utmost important to understand the science and technology behind the welding. This course is aimed at familiarizing the students with the fundamentals weld joint design, metallurgical aspects in welding of steel, and assessing the quality and suitability of weld joints. Topics related with weldablity of metals shall also be covered to equip the students technological input for handling the problems in welding of selected metals and alloys.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Understand the concept of static design of joints.
- Design of welded joints and static and dynamic loading.
- Evaluate the metallurgical and thermal aspects of welding joints of metals acquire knowledge about the cooling transformation curves of welded joints acquire knowledge about destructive and non-destructive tests of weldments

SKILLS :

- Evaluate the static stresses in loaded welded structures
- Evaluate the developed dynamic stresses in the welding structures
- Understand heat flow through the welding joints
- Understand the CCT of weldments
- Understand the destructive and non-destructive tests of the weldments

Unit – I

Introduction: Welded joints, symbols, welded defects; Design considerations; Joint efficiency;Factor of safety, Types of loading; Permissible stress; Computation of stresses in welds;Weld size calculation; Code requirement for statically loaded structures.

Unit - II

Dynamic Behaviour of Welded Joints and Failure Theories: Design for fluctuating and impact loading; Dynamic behavior of welded joints; Stress Concentrations; Fatigue analysis; Fatigue improvement techniques; Permissible stress- life prediction; Concept of stress intensity factors - LEFM and EPFM concepts; Brittle fracture; Transition temperature approach, Application of fracture mechanics to fatigue..

Unit - III

Welding Metallurgy: Thermal effect of welding on parent metal; Structure of fusion welds; Effect of cooling rate; Weld metal solidification and heat affected zone; Heat flow - temperature distribution-cooling rates; Influence of heat input; Joint geometry; Plate thickness; Preheat; Significance of thermal severity number; Epitaxial growth - weld metal solidification - columnar structures and growth morphology effect of welding parameters; Absorption of gases - gas/metal and slag/metal reactions.

Unit - IV

Phase Transformations: weld CCT diagrams - carbon equivalent-preheating and post heating weldability of low alloy steels; Welding of stainless steels use of Schaffler and Delong diagrams;

Unit-V

Testing of Weld Joints: Destructive and non-destructive tests; Equipments required of tests; Tensile test; Bend test; Impact test; Hardness test; Brittle and fatigue failure tests; Dye penetrate inspection; Magnetic particle inspection etc.

Lab Component:

1. Preparation of formulae of failure of joints and joint efficiency
2. Calculation of weld size
3. Calculation of life of welded joint
4. Drawing CCT diagrams of weldment
5. Calculation of load required to fail joint in tension, and bending

TEXT BOOKS:

1. Design of Weldments; W. B. Omer; James. F. Lincoln; Arc Welding Foundation; 1991.
2. Deformation and Fracture of Mechanics of Engineering Materials; R. W. Hertzberg; John Wiley;1996.
3. Welding Metallurgy; Volume I and II; 4th Edition; G. E. Linnert; AWS; 1994
4. The Metallurgy of Welding, 6th Edition , Lancaster, William Andrew Publishing, NY

REFERENCE BOOKS:

1. Rational Welding Design; T. G. E. Gray; Butterworths; 1982.
2. Mechanical Metallurgy; G. Dieter; Tata McGraw Hill; 1988.
3. Weldment Design; M. Bhattacharya; Association of Engineers;1991.
4. Fundamentals of Welding Metallurgy; H. Granjon; Jaico Publishing House; 1994.
5. Introduction to Physical Metallurgy of Welding; 2nd Edition; Easterling Kenneth; Butterworth Heinmann; 1992.

Activities:

1. Preparation of formulae of failure of joints and joint efficiency
2. Calculation of weld size
3. Calculation of life of welded joint
4. Drawing CCT diagrams of weldment
5. Calculation of load required to fail joint in tension, and bending

17MD017 RELIABILITY ENGINEERING

Hours Per Week :

L	T	P	C
3	1	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives

Reliability is one of the biggest concerns with almost all physical Systems used in the industry. This course equips the students with all the concepts and tools that are required to assess & Manage risk and plan for uninterrupted and hassle free operation of industrial systems.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Convince others on the importance of reliability with examples and show clear understanding of the terms and confusion commonly found in reliability.
- Analyze failure modes for any engineering system.
- Develop suitable life testing procedures for a given component and draw inferences on the test results.
- Explain and Identification of the possible causes of poor reliability.
- Suggest appropriate reliability tests and the associated failure analysis methods.

SKILLS:

- Calculate the Reliability.
- Develop FTA for a system.
- Analyze the risk involved in a system or a process.
- Evaluate the failure mechanism of a system.

UNIT-I

Reliability Engineering: Reliability function – failure rate – Meantime between failures (MTBF) – Mean time to failure (MTTF) – Probability concept – Additional of probabilities – complimentary events useful life availability – maintainability – system effectiveness

UNIT-II

Reliability Data Analysis :Time tofailure distributions – Exponential, normal, Gamma, Weibull, ranking ofdata – probabilityplottingtechniques – Hazardplotting.

UNIT-III

Reliability Prediction Models: Series and parallel Systems – RBD approach – Stand by systems - k/m configuration – Application of Bayes theorem – cut and tie set method – Markov analysis – FTA – Limitations.

UNIT-IV

Reliability Management :Reliability Testing – Reliability growth monitoring – Non parametric methods – Reliability and life cycle costs – Reliability allocation – Replacement model.

UNIT-V

Risk Assessment : Definiton and measurement risk – risk analysis techniques – risk reduction resources – industrial safety and risk assessment.

Text Books:

1. John Davidson, The Reliability of Mechanical System, 2nd Edition, Published by the Institution of Mechanical Engineers, London, 1998.
2. E.BalaguruSwamy, ReliabilityEngineering, 1st Edition,TataMc.GrawHill,NewDelhi,2003.
3. Charles E.Ebeling, Reliability and Maintainability Engineering, 2nd Edition, Tata McGraw Hill, 2009.

Reference Books:

1. Modarres, Reliability and Risk analysis, 1st Edition, CRC Press, 1992.
2. SmithC.O.Introduction to Reliability in Design, 1st Edition, McGraw Hill, London, 1976.

Activities:

1. Draw Fault tree Diagram for all machines in Dynamics Lab.
2. Perform FMEA on each machine in Machine Dynamics lab.

17MD019 INDUSTRIAL HYDRAULICS AND PNEUMATICS

Hours Per Week :

L	T	P	C
3	-	2	5

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

This course equips the students with know how of hydraulic systems and pneumatic systems required for selection, design, operation and maintenance.

Course Outcomes:

Upon successful completion of this course student wll be able to:

- Design circuits used in hydraulic systems.
- Operate different types of valves used in hydraulic system
- Classify the valves used in hydraulic systems.
- Maintain different valves and auxiliaries.
- Assemble pumps and motors to rectify problems. Develop efficient hydraulic circuits.
- Maintain the pneumatic and hydraulic system

SKILLS :

- Demonstrate various accessories and their uses in hydraulic system Draw graphical symbols.
- Use directional,pressure control valves for various applications.
- Demonstrate application of injection control circuit.
- Understand the use of pressure intensifier.

UNIT-I

Basic Principles: Principles of Hydraulics, Hydraulic pumps and their characteristics, pumpselection, pumping circuits, Hydraulic actuators both linear &rotary, selection& characteristics of pumps, Hydraulic valves, pressure & Flow direction controls, applications, Hydraulic fluids, symbols.

UNIT-II

Hydraulic Circuits: Reciprocating, Quick Return, Sequencing, Synchronizing andAccumulator, Safety circuits.

UNIT-III

Design & Selection: Design of Hydraulic circuits and selection of components.

UNIT-VI

Pneumatic fundamentals, control elements, logic circuits, sensing of position and pressure, switching. Electro-pneumatic and Electro Hydraulic circuits Robotic circuits.

UNIT-V

Design of pneumatic circuits: Classic, cascade, step counter and combination methods PLC,Microprocessors, uses, selection criteria for pneumatic components, Installation and maintenance of Hydraulic and pneumatic power packs–fault finding, principles of low cost automation and case students.

TEXT BOOKS:

1. J.Michael and G.Ashby,"Power Hydraulics, 2nd Edition, Prentice Hall,1989.

3. The Metallurgy of Welding; D. Saferian; Chapman and Hall; 1985. Welding Methods and Metallurgy; M. D. Jackson; Grffin; London; 1967.

Activities:

1. Preparation of chart for different hydraulic symbols.
2. Collection of information related troubleshooting various problems.
3. Preparation of animations on internet for understanding functioning of various hydraulic and pneumatic components
4. Demonstration of use of clamp control and reciprocating screw circuits.

Course Description and Objectives:

This course offers computational methods to solve and analyze problems involving fluid flowand heat transfer. The objective of this course is to enable the students to simulate the interaction of fluids and gases with the surfaces for various initial and boundary conditions.

Course Outcomes:

Upon successful completion of this course student will be able to:

- develop a geometrical model for the fluid flow.
- apply appropriate boundary conditions and visualize the obtained results. gain skills in the actual implementation of CFD methods
- formulate finite difference and finite volume methods for various fluid flow problems assess stability of a given numerical scheme.

SKILLS:

- Convert partial differential equations to linear algebraic equations. Solve linear equations using various numerical techniques.
- Visualize the fluid flow patterns and heat transfer phenomenon using various plots. Analyze the results with available experimental results.
- Apply finite difference methods for various fluid flow problems.
- Perform stability and grid-convergence analysis for a given numerical scheme.

UNIT-I

Introduction to Numerical Methods - Finite Difference, Finite Element and Finite Volume Methods – Classification of Partial Differential Equations – Solution of Linear Algebraic Equations – Direct and Iterative Approaches

Finite difference methods: Taylor's series – FDE formulation for 1D and 2D steady state heat transfer problems – Cartesian, cylindrical and spherical co-ordinate systems – boundary conditions – Un steady state heat conduction – Errors associated with FDE - Explicit Method – Stability criteria – Implicit Method – Crank Nickolson method – 2-D FDE formulation – ADI – ADE

UNIT-II

Finite Volume Method: Formation of Basic rules for control volume approach using 1D steady heat conduction equation – Interface Thermal Conductivity - Extension of General Nodal Equation to 2D and 3D Steady heat conduction and Unsteady heat conduction

UNIT-III

FVM to Convection and Diffusion: Concept of Elliptic, Parabolic and Hyperbolic Equations

applied to fluid flow – Governing Equations of Flow and Heat transfer – Steady 1D

Convection Diffusion – Discretization Schemes and their assessment – Treatment of

Boundary Conditions

UNIT-IV

Calculation of Flow Field: Vorticity & Stream Function Method - Staggered Grid as Remedy for representation of Flow Field - Pressure and Velocity Corrections – Pressure Velocity Coupling - SIMPLE & SIMPLER (revised algorithm) Algorithm.

UNIT-V

Turbulent Flows: Direct Numerical Simulation, Large Eddy Simulation and RANS Models

Compressible Flows: Introduction - Pressure, Velocity and Density Coupling.

Lab Component:

1) CFD analysis of laminar flow over plate in FLUENT
2) CFD analysis of turbulent flow over plate in FLUENT
3) CFD analysis of laminar flow over a sphere in FLUENT
4) Numerical analysis of convective heat transfer in FLUENT/MATLAB

TEXT BOOKS:

1. Computational Fluid Flow and Heat Transfer – Muralidharan & Sundarajan (Narosa Pub)
2. Numerical heat transfer and fluid flow – S.V. Patankar (Hemisphere Pub. House)
3. An Introduction to Computational Fluid Dynamics – FVM Method – H.K. Versteeg, W. Malalasekhara (PHI)
4. Computational Fluid Dynamics – Anderson (TMH)
5. Computational Methods for Fluid Dynamics – Ferziger, Peric (Springer)

REFERENCE BOOKS:

1. Computational Fluid Dynamics, T.J. Chung, Cambridge University
2. Computaional Fluid Dynamics – A Practical Approach – Tu, Yeoh, Liu (Elsevier)

17MD012 INDUSTRIAL TRIBOLOGY

Hours Per Week :

L	T	P	C
3	-	-	3

Total Hours :

L	T	P	WA/RA	SSH/HSH	CS	SA	S	BS
45	-	-	-	-	-	-	-	-

Course Description and Objectives:

Tribology deals with the study of friction, lubrication and wear in all contacting pairs.The Tribological knowledge helps:To provide fundamental knowledge in lubrication,.rubbing of surfaces & wear. To design efficient mechanical systems using good bearings to provide high quality machines. To improve service life, safety and reliability of interacting machine components; and yields substantial economic benefits.

Course Outcomes:

Upon successful completion of this course student should be able to:

- Understand the concepts of the tribological phenomenon of Engineering systems.
- Design any type of Engineering system incorporating lubrication.
- Propose suitable lubrication and types of bearing for a given operational parameters.

SKILLS:

- Calculate the dynamic capacity of rolling bearings and selection of suitable bearing
- Evaluation of film thickness and amount of heat generated in the journal bearing
- Understand the design procedure of thrust bearing
- Suggest proper lubrication procedure and equipment
- Understand the wear analysis of components

Unit – I

Introduction : Nature of surfaces and contact-Surface topography-friction and wear mechanisms and effect of lubricants methods of fluid film formation. Selection of rolling element bearings: Nominallife, static and dynamic capacity– Equivalent load, probabilities of survival – cubic mean load– bearing mounting details, preloading of bearings,

Conditioning monitoring using shock pulse method.

Unit – II

Hydrodynamic bearings : Fundamentals of fluid formation –Reynold's equation; Hydrodynamic journal bearings–Sommerfield number–performance parameters– Optimum bearing with maximum load capacity – Friction – Heat generated and Heat dissipated. Hydrodynamic thrust bearings; Raimondi and Boyd solution for hydrodynamic thrust bearings–fixed tilting pads, single and multiple pad bearings-optimum condition with largest minimum film thickness.

Unit – III

Hydrostatic Bearings :Thrust bearings –pad coefficients –restriction –optimum

Film thickness- journal bearings–design procedure –Aerostatic bearings; Thrust bearings and Journal bearings– design procedure. Dry rubbing Bearings : Porous metal bearings and oscillatory journal bearings – qualitative approach only.

Unit – IV

Lubrication : Choice of lubricants,types of oil, Grease and solid lubricants – additives – lubrication systems and their selection – selection of pump, filters, piping design – oil changing and oil conservation.

Unit – V

Seals: Different types–mechanical seals, lipseals, packed glands, soft piston seals, Mechanical Piston rod packing, labyrinth seals and throttling bushes,oil flinger rings and drain grooves–selection of mechanical seals.

Failure of Tribological components: Failure analysis of plain bearings, rolling bearings, gears and seals, wear analysis using Ferrography.

Activities:

1. Design of journal bearing
2. Design of thrust bearing
3. Evaluating pressure distribution at journal bearing interface
4. Design calculations for the selection of rolling beaings

17MD014 GEAR ENGINEERING

Hours Per Week :

L	T	P	C
-	1	-	4

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

Gearsareprime machine element members in many of the power transmission devices. Proper design and selection of efficient gearing system improves the overall efficiency of the system. Force analysis on gears and various dimensions of gears based on static , dynamic and wear considerations covered in this course. Gear failure and optimum gear design is also focused.

Course Outcomes:

Upon successful completion of this course student will be able to:

- Analyze forces acting on gear.
- Design various types of gears under static and dynamic loading.
- Identify the gear failures.
- Design gear box and selection of gear trains.
- Apply optimization principles to design gear against strength, space,size, weight etc.

SKILLS:

- Force analysis on gearsPower transmitted by gears evaluation
- Gear dimension and other parameters estimation
- Gear failure analysis and able to suggest remedies
- Gear box design
- Gear design optimization

UNIT–I

Introduction :Principles of gear tooth action, Generation of Cycloid and Involute gears, fundamental law of gearing, contact ratio, gear manufacturing processes ,gear tooth failure modes, stresses.

Spur Gears : Tooth loads, Principles of Geometry,Design considerations and methodology, Complete design of spur gear teeth considering Lewis beam strength, Buckingham's dynamic load and wear load,.

UNIT–II

Helical Gears : Helical gear geometry, helical gear forces, virtual number of teeth, contact ratio, Design considerations ,Complete design of helical gear teeth considering Lewis beam strength, Buckingham's dynamic load and wear load,.

Bevel Gears :Tooth loads, Principles ofGeometry, Design considerations and methodology, Complete design of bevel gear teeth considering Lewis beam strength, Buckingham's dynamic load and wear load,

UNIT–III

Worm Gears : Nomenclature of worm and worm wheel, materials for worm gears, forces on worm wheels, , Design considerations and methodology, Complete design of worm gear teeth considering Lewis beam strength, Buckingham's and wear load, Heat dissipation considerations.

Gear Failures:Analysis of gear tooth failures, Nomenclature of gear Tooth wear and failure, tooth breakage,pitting,scoring,wear,overloading,gear-causingproblems,lubricationfailures.

UNIT–IV

GearTrains: Simple, compound and epicyclic geartrains, Raydiagrams, Design of a gear box of an automobile, Design of gear trains from the propeller shafts of airplanes for auxiliary systems.

UNIT–V

Optimal Gear design: Optimization of gear design parameters, Weight minimization, Constraintsin gear train design- space, interference, strength, dynamic considerations, rigidity etc. Compact design of gear trains, multi objective optimization of gear trains.

TEXT BOOKS:

1. Norton,"Machine Design - An Integrated Approach", 2nd Edition,Pearson Publications, 2003
2. Henry E.Merrit,"Gear Engineering",2ndEdition,Wheeler publishing, Allahabad,2000

REFERENCEBOOKS:

1. Shigley,"Machanical Engineering Design",10th Edition, McGraw Hill Publishers, 2015.
2. G.M.Maitha, "HandBook of Gear Design", 2nd Edition, Tata Mc.Graw Hill Publishing company Ltd.,NewDelhi, 1995

ACTIVITIES:

- Spur gear design for the given power requirement based on space constraints.
- Helical gear design based on static and wear considerations.
- Bevel gear design for differential In automobile applications.
- Ray diagram preparation and gear box design for machine tool applications.
- Gear design optimization with space , weight and cost constraints.

17MD016 EXPREIMENTAL STRESS ANALYSIS

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

Experimental Stress Analysis plays a very vital role in engineering design and performance monitoring of mechanical equipment. Various types of stress measurement techniques are discussed in this course. The main focus is on Photoelasticity, strain gauges. Topic of stress transformations is also included to provide knowledge about converting the experimental stress values into stress components that can be easily used in machine design.

Course Outcomes:

Upon successful completion of the course student will be able to:

- Understand the process of conversion of stress components from one coordinate system to the other.
- Acquire knowledge in selection of strain gauges.
- Suggest suitable experimental stress measuring technique based on application.
- Explain the measurement of strains or stresses by using different experimental methods

Skills:

- Computation of stresses from the strain rosette data.
- Computation of stresses from the data obtained from moiré fringe pattern.
- Computation of stress from the data obtained from photo elastic experiment.
- Identification of stress conditions from Brittle coating patterns.

UNIT-I

Introduction:Theory of Elasticity, Plane stress and plane strain conditions, Compatibility conditions, Problems using plane stress and plane strain conditions.Three-dimensional stress strain relations.

UNIT-II

Brittle coatings: Introduction, coating stresses, failure theories,brittle coating crack patterns, crack detection, ceramic based brittle coatings, resin based brittle coatings, test procedures for brittle coatings, analysis, calibration procedures, analysis of brittle coating data.

UNIT - IV

Moire Methods:Introduction, mechanism offormationofMoirefringes,thegeometrical approachto Moire-Fringe analysis, the displacement field approach to Moire-Fringe analysis, out of plane displacement measurements, out of plane slope measurements, sharpening and multiplication of moiré-Fringes, experimental procedures and techniques.

Birefringent Coatings: Introduction, Coating stresses and strains, coating sensitivity, coating materials,application of coating effects of coating thickness,Fringe-order determinations in coatings, stress separation methods.

UNIT-V

Photoelasticity: Polariscope–Planeandcircularly polarized light. Photoelasticmaterials–Isochromaticfringes–Isoclinics,three-dimensional Photoelasticity: locking inmodel deformation, materials forthree dimensional photo elasticity, machining, cementing and slicing the three dimensional models, slicing the model and interpretation of the resulting fringe patterns, effective stresses, the shear-difference method in three dimensions, application of the Frozen-stress method,the scattered-light method.

TEXT BOOKS:

1. Dally and Riley,"Experimental stress analysis",3rd Edition,McGraw Hill,1991.
2. Dr.Sadhu Singh,"Experimental stress analysis",2nd Edition,Khanna Publications,1990.

REFERENCE BOOKS:

1. Timoshenko and Goodier JN,"Theory of Elasticity",3rd Edition,Tata McGraw Hill,2010.
2. Frocht,"Photo Elasticity",3rd Edition,Wiley Sons & Co.,2008.

Activities:

- Calculation of principle stresses and their directions for three dimensional problems.
- Calculation of strains for a given strain gauge arrangement.
- Calculation of stresses in prototypes from the results of Photoelastic experiment.

17MD018 NANO TECHNOLOGY

Hours Per Week :

L	T	P	C
3	1	-	3

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To provide a basic understanding with case studies on different surface NDE techniques and apply them for inspecting materials in accordance with industry specifications and standards.

- To provide knowledge and enrich ideas about the conventional NDT techniques
- develop a strong hands on experience for inspecting and evaluating components in accordance with industry specifications
- To develop a fundamental knowledge about the advanced techniques and the recent developments in non-destructive testing so as to control the quality in manufacturing engineering components.

Course Outcomes:

After successful completion of this course the student will be able:

- To have a basic knowledge of surface NDE techniques which enables to carry out various inspection in accordance with the established procedures.
- To calibrate the instrument and inspect for in-service damage in the components.
- To differentiate various defect types and select the appropriate NDT methods for better evaluation.
- To communicate their conclusions clearly to specialist and non-specialist audiences.
- To document the testing and evaluation of the results for further analysis

SKILLS :

- Analyzing engineering problems, selecting and using mathematical and theoretical data to provide suitable NDT solutions with consideration of the entire inspection cycle
- Apply their engineering knowledge to the development, operation, maintenance and progression of technologies used for NDT
- Observe, record and draw conclusions from data and experimental evidence, recognizing inherent uncertainties and limitations
- Applying design processes, including materials selection that meet NDT standards

UNIT-I

Importance of Nano-technology, Emergence of Nano-Technology, Bottom-up and Top-down approaches, challenges in NanoTechnology.

General Introduction: Basics of Quantum Mechanics, Harmonic oscillator, magnetic Phenomena, band structure in solids, Mossbauer and Spectroscopy, optical phenomena bonding in solids, Anisotropy.

UNIT-II

Silicon Carbide: Application of Silicon car bide, nano materials preparation, Sintering of SiC,X-rayDiffraction data, electron micro scopy sintering of nano particles, Nano particles of Alumina

And Zirconia: Nano materials preparation, Characterization, Wear materials and nano composits.

UNIT-III

Mechanical properties: Strength of nano crystalline SiC, Preparation for strength measurements, Mechanical properties, Magnetic properties.

UNIT-IV

Electricalproperties:Switchingglasseswithnanoparticles,Electronicconductionwithnano particles.

Opticalproperties: Opticalproperties, special properties and the coloured lasses.

UNIT-V

Process of synthesis of nano powders, Electrode position, Important nano materials Investigating and manipulating materials in the nano scale: Electron microscopes, scanning probe microscopes, optical microscopes for nano science and technology, X-ray diffraction.

TEXT BOOKS:

1. A.K.Bandyopadhyay,"Nano Materials",1st Edition,New Age Publishers,2009
2. T.Pradeep,"Nano the Essentials",3rd Edition,Tata McGraw Hill, 2009

17MD020 CONDITION MONITORING AND FAULT DIAGNOSIS OF MACHINES

Hours Per Week :

L	T	P	C
3	1	-	4

Total Hours :

L	T	P
45	-	-

WA/RA	SSH/HSH	CS	SA	S	BS
-	-	-	-	-	-

Course Description and Objectives:

To provide a basic understanding with case studies on different surface NDE techniques and apply them for inspecting materials in accordance with industry specifications and standards.

- To provide knowledge and enrich ideas about the conventional NDT techniques
- Develop a strong hands on experience for inspecting and evaluating components in accordance with industry specifications
- To develop a fundamental knowledge about the advanced techniques and the recent developments in non-destructive testing so as to control the quality in manufacturing engineering components.

Course Outcomes:

After successful completion of this course the student will be able to:

- Understand the benefits of condition monitoring
- Calibrate the instrument and inspect for in-service damage in the components.
- Differentiate various defect types and select the appropriate monitoring methods for better evaluation.
- Ability to communicate their conclusions clearly to specialist and non-specialist audiences.
- Documentation of the testing and evaluation of the results for failure analysis.

SKILLS:

- Analyzing engineering problems, selecting and using mathematical and theoretical data to provide suitable NDT solutions with consideration of the entire inspection cycle
- Apply their engineering knowledge to the development, operation, maintenance and progression of technologies used for NDT
- Observe, record and draw conclusions from data and experimental evidence, recognizing inherent uncertainties and limitations
- Applying design processes, including materials selection that meet NDT standards

UNIT - I

Introduction: System failure, component failure, failure decisions, failure classifications, types of failure, failure investigations, causes of failure, Methods of maintenance – condition based maintenance, preventive maintenance, predictive maintenance, proactive maintenance.

UNIT - II

Condition Monitoring: Need and importance of condition monitoring, the decision to monitor, common monitoring techniques, online/off-line monitoring, commonly measured operating characteristics.

UNIT - III

Transducers and Instrumentation for Recording and Analysis: Vibration transducers Displacement transducers, velocity pickups, accelerometers, Temperature transducers Vibrationmeters, FFT analyzers. Time domain instruments, Tracking analyzers.

UNIT - IV

Analyzing Machine Condition: General characteristics-Process measurements, vibration, Typical vibration sources, symptoms of other common machinery problems.Development and use of acceptance limits-guide line and limits based on physical constraints. Vibration severity criteria, changing machinery condition-time trends and detailed diagnostic monitoring.

UNIT - V

Data Processing & Vibration Analysis: Fourier analysis, frequency analysis techniques, vibration signature, vibration monitoring equipment, system monitors and vibration limit detectors. Performance Trend Monitoring : Primary and secondary performance parameters, performance monitoring systems

.

Activities:

- Inspection of welds using solvent removable visible dye penetrant.
- Inspection of welds using solvent removable fluorescent dye penetrant.
- Inspection of welds by Magnetic Particle Testing - Dry method.
- Inspection of welds by Magnetic Particle Testing- Wet method.
- Inspection of a welded plate by radiographic single wall single image technique- X rays.
- Inspection of a welded pipe by Panoramic Technique- Gamma rays.
- Inspection of a welded pipe by double wall single image technique - Gamma rays.
- Familiarization of ultrasonic flaw detectors

Total Hours :

L	T	P
45	-	36

WA/RA	SSH/HSH	CS	SA	S	BS
05	05	05	05	05	10

Course Description and Objectives:

This course deals with the basic concepts of converters, choppers, inverters and their analysis.

With the advent of semiconductor devices, revolution is taking place in the power transmissions, distribution and utilization.

Course Outcomes:

Upon successful completion of this course, the student should be able to:

a. Describe the operation of dc-dc, dc-ac, ac-dc and ac-ac power converters.

b. able to analyze and design switched mode regulator for various industrial applications.

c. Comprehend the concepts of different power converters and their applications.

d. Evaluate the effects of various modulation techniques on the quality of input and output waveforms.

SKILLS:

- Able to understand analysis of basic power electronics converters
- Able to understand the power quality issues (current and voltage harmonics) caused by the operation of the converters in a power network
- Able to acquire a skill of understanding principles of static power conversions, PWM techniques for voltage and frequency control, circuit design considerations, and applications of power electronics.

ACTIVITIES:

- *Design of DC-DC converter for battery charging application.*
- *Design of inverter for UPS.*
- *Design of regulator by using AC-AC converter.*

UNIT – I **L- 09**

Phase Control Rectifiers : Introduction– Half controlled and Fully controlled converters –harmonic analysis —power factor Improvement -single phase series converters –Numerical problems. Three phase converters – Half controlled and fully controlled converters – harmonic analysis — power factor Improvement – twelve pulse converter– dual converters – Numerical problems.

UNIT – II **L- 09**

Three phase AC voltage controllers and cyclo Converters: Three phase AC voltage controllers – Analysis of controllers with star and delta Connected loads–applications–numerical problems. Three phase to three phase cycloconverters – analysis of Midpoint and bridge configurations – Limitations – Advantages – Applications –numerical problems.

UNIT – III L- 09

D.C. to D.C. Converters: Switched mode regulators–analysis of Buck ,Boost , buck-boost and Cuk regulators– comparison- Numerical problems .DC-DC converters with isolation- fly back, forward, push pull and half bridge configurations- comparison – applications –Numerical problems.

UNIT – IV **L- 09**

Pulse Width Modulated Inverters(Three Phase): Three phase inverters – analysis of 180 degree 120 degree Conduction modes – voltage control of three phase inverters – sinusoidal PWM – Third Harmonic PWM – 60 degree PWM – space vector modulation – Comparison of PWM techniques – Current Source Inverter.

UNIT – V **L- 09**

Resonant Converters: Resonant Converters- Zero current switching (ZCS) DC-DC converter -zero voltage switching(ZVS) DC-DC converter- clamped voltage (ZVSCV)- applications –Numerical problems.

LABORATORY EXPERIMENTS

List of Experiments Total Hours-36

1. Single phase AC voltage controller.
2. Single phase cyclo converter.
3. Single phase fully controlled bridge converter
4. Single phase half controlled bridge converter.
5. Series resonant converter.
